*The GENIUS of the Work instructing YOUTH in the Conduct of those illustrious
Circumnavigators &c. whose medallions are here exhibited and whose Important
Discoveries & Exploits (amongst others) are recorded in our Collection.*

A
NEW, AUTHENTIC, and COMPLETE COLLECTION of
Voyages Round the World,
Undertaken and Performed by ROYAL AUTHORITY.

Containing a NEW, AUTHENTIC, ENTERTAINING, INSTRUCTIVE, FULL, and COMPLETE HISTORICAL ACCOUNT of

Captain COOK's
First, Second, Third and Last
VOYAGES,
Undertaken by Order of his PRESENT MAJESTY,

FOR MAKING

NEW DISCOVERIES in GEOGRAPHY, NAVIGATION, ASTRONOMY, &c.
in the SOUTHERN and NORTHERN HEMISPHERES, &c. &c. &c.

His FIRST VOYAGE—being professedly undertaken in his Majesty Ship the *Endeavour*, for making New Discoveries in the Southern Hemisphere, and round the World.

His SECOND—In the *Resolution* and *Adventure*, for making further Discoveries towards the South Pole, and round the World.

His THIRD and LAST—in the *Resolution* and *Discovery*, to the Pacific Ocean, for making New Discoveries in the Northern Hemisphere, and to determine the Position and Extent of the West Side of North America; its Distance from Asia; and the Practicability of a Northern Passage to Europe.

Comprehending, among the greatest Variety of the most interesting Transactions, a faithful Account of all the Particulars relative to the unfortunate Death of Capt. Cook, with Memoirs of his Life, &c. &c.

Including likewise all the curious Remarks communicated to this Country by Capt. Cook's principal Assistants in performing and conducting these celebrated Voyages, viz. Sir Joseph Banks, Dr. Solander, Dr. King, Dr. Hawkesworth, Dr. Forster, Mr. Forster, Capt. Clerke, Capt. Gore, Mr. Ellis, &c. &c.

Together with a Narrative of Capt. Furneaux's Proceedings in the *Adventure*, during the Separation of that Ship from the *Resolution*, in which Period several of his People were destroyed by the Natives of Queen Charlotte's Sound, in New Zealand.

TO WHICH WILL BE ADDED,

Complete and Genuine Narratives of other Voyages of Discovery Round the World, &c. undertaken, performed, and written by English Circumnavigators, &c. under the Sanction of Government, viz. those of Lord BYRON, Capt. WALLIS, Capt. CARTERET, Lord MULGRAVE, Lord ANSON, &c. &c. &c. Including a faithful Relation of the Substance of all the most remarkable and important Travels and Journeys, which have been undertaken at various Times to the different Quarters of the World; particularly those of HANWAY, HAMILTON, HERBERT, DRUMMOND, POCOCK, SHAW, STUART, KALM, CARVER, DALRYMPLE, BURNET, ADDISON, BARRETTI, KEYSER, THICKNESS, TWISS, BRYDONE, CHANDLER, JOHNSON, SMOLLET, MOORE, WRAXALL, &c.

The WHOLE comprehending a full Account, from the EARLIEST PERIOD to the PRESENT TIME, Of whatever is curious, entertaining, and useful, both by Sea and Land, in the various Countries of the known World, faithfully extracted from the original Journals of the respective Voyagers, &c. &c. &c.

Being the most accurate, elegant, and perfect Edition, of the Whole of Capt. COOK's VOYAGES and DISCOVERIES, &c. ever published, and written in a more pleasing and elegant Style than any other Work of the Kind.

Illustrated with all the elegant, splendid, and fine LARGE FOLIO COPPER-PLATES, belonging to Capt. COOK's FIRST, SECOND, THIRD and LAST VOYAGES, being Views of Places, Portraits of Persons, and historical Representations of remarkable Incidents during this celebrated NAVIGATOR's VOYAGES ROUND THE WORLD, together with all the necessary Maps, Charts, Plans, Draughts, &c. shewing the Tracks of the Ships, and relative to Countries now first discovered, or hitherto but imperfectly known; the Whole amounting to upwards of ONE HUNDRED and FIFTY COPPER-PLATES, finely engraved and accurately copied from the Originals by the most eminent Masters.

It is proper to observe, that some other Editions of these Works (unnecessarily extended to many large Volumes, by loose Printing, blank Paper, and other Artifices, practised by mercenary Persons) would cost a Purchaser the enormous Sum of upwards of Twenty Guineas; so that many Thousands of Persons who would wish to peruse the valuable Discoveries so partially communicated to the World, and view the astonishing fine Copper-Plates, have hitherto been excluded from gratifying their eager Curiosity; but THIS EDITION, by being published in only EIGHTY SIX-PENNY NUMBERS, (making, when completed, ONE Large, Handsome Volume in Folio) enables every Person, whatever may be his Circumstances, to become familiarly acquainted with those extraordinary and important Voyages and Discoveries, in the Performance and Prosecution of which such vast Sums of the Public Money have been expended. Therefore as the Price of THIS WORK is rendered so moderate and easy, the WHOLE of Capt. COOK's VOYAGES, &c. will be more universally read, and the obvious Intention of the KING and GOVERNMENT, that the Improvements and Discoveries in these celebrated Voyages might be communicated to the whole World, will of Course be more fully answered.

The Whole of these VOYAGES of Capt. JAMES COOK, &c. being newly written by the EDITORS from the AUTHENTIC JOURNALS of several PRINCIPAL OFFICERS and OTHER GENTLEMEN of the most distinguished Naval and Philosophical Abilities, who sailed in the various Ships; and now publishing under the immediate Direction of

GEORGE WILLIAM ANDERSON, Esq.

Assisted, very materially, by a PRINCIPAL OFFICER who sailed in the RESOLUTION SLOOP,
And by other Gentlemen of the ROYAL NAVY.

L O N D O N :

Printed for ALEX. HOGG, at the KING'S ARMS, No. 16, *Paper-Printer-Row*; and sold by all Booksellers and News-Carriers.

The P R E F A C E.

THE great Utility and very interesting Nature of the important FIRST, SECOND, and THIRD VOYAGES and DISCOVERIES of the late Capt. COOK, are acknowledged by all Ranks of People; consequently it might be deemed impertinent here to attempt any Encomiums on the arduous but exact Researches of this eminent and valuable Navigator, in which Discoveries have been made far greater than those of all the other Navigators in the World, from the Expedition of Columbus to the present Time. Capt. Cook is unquestionably allowed to have been the ablest and most renowned Circumnavigator this or any other Country has produced; and every enlightened Nation must deplore his being unfortunately killed by the Savages of the Island Owhyhee, on the 14th of February 1779, when prosecuting his LAST VOYAGE round the Globe.

This great Man possessed, in an eminent Degree, all the Qualifications requisite for his Profession and great Undertakings. He was cool and deliberate in judging; sagacious in determining; active in executing; steady and persevering in Enterprizes; vigilant, with unremitting Caution; unsubdued by Labour, Difficulties, and Disappointments; fertile in Expedients; never wanting Presence of Mind; always possessing himself of the full Use of a sound Understanding; mild, just, but exact in Discipline. His Knowledge, his Experience, and his Sagacity, rendered him so entirely Master of his Subject, that the greatest Obstacles were surmounted, and the most dangerous Navigations became easy, and almost safe, under his Direction. He explored the Southern Hemisphere, &c. to a much higher Latitude than had ever been reached, and with fewer Accidents than frequently befall those who navigate the Coasts of Great Britain. By his Attention to the Welfare of his Ship's Company, he discovered and introduced a System for the Preservation of the Health of Seamen in long Voyages, which has proved wonderfully efficacious: for in his SECOND VOYAGE round the World, which continued upwards of three Years, he lost only one Man by Distemper, of One Hundred and Eighteen Persons, of whom his Company consisted.

The Death of this valuable Man was a Loss to Mankind in general; and particularly to be deplored by every Nation that respects useful Accomplishments, and honours Science. It is still more to be deplored by this Country, which may justly boast of having produced a Man hitherto unequalled for nautical Talents; and that Sorrow is farther aggravated by the Reflection, that his Country was deprived of this Ornament by the Enmity of a People, from whom, indeed, it might have been dreaded, but from whom it was not deserved: for, Capt. Cook frequently interposed, at the Hazard of his Life, to protect these very People from the sudden Repentment of his own injured Ship's Crew. Let us contemplate, admire, revere, and emulate, this great Navigator; whose Skill and Labours have enlarged natural Philosophy; have extended nautical Science; and have disclosed the long concealed and admirable Arrangements of the Almighty in the Formation of this Globe, and at the same Time the Arrogance of Mortals, in presuming to account, by their Speculations, for the Laws by which he was pleased to create it. It is now discovered, beyond all Doubt, that the same Great Being who created the Universe by his *Fiat*, by the same ordained our Earth to keep a just Poise, without a corresponding Southern Continent. The arduous and accurate Researches of Capt. Cook have discovered Seas un navigated and unknown before. They have made us acquainted with Islands, People, and Productions, of which we had no Conception: and the Name of Capt. Cook will be revered, while there remains an authentic Account of his Three respective Voyages, and as long as Mariners and Geographers shall trace the various Courses and Discoveries he has made.

Among other Advantages which must result from the Undertakings of this unparalleled Commander, it is probable that *these Voyages* may be the Means of spreading, in Time, the Blessings of Civilization amongst the numerous Tribes of the *South Pacific Ocean*, of abolishing their horrid Repasts, and their equally horrid Rites; and of laying a Foundation for future and more effectual Plans, to prepare them for holding an honourable Station amongst the Nations of the Earth. Other Discoveries of new Countries have, in general, been Wars, or rather Massacres. Nations have no sooner been found out, than they have been extirpated; and the horrid Cruelties of the Conquerors of Mexico and Peru, can never be remembered without blushing for Religion and human Nature. But when the Recesses of the Globe are investigated, not to enlarge private Dominion, but to promote general Knowledge; when we visit new Tribes of our Fellow Creatures as Friends, and wish only to learn that they exist, in order to bring them within the Pale of the Offices of Humanity, and to relieve the Wants of their imperfect State of Society, by communicating to them our superior Attainments; Voyages of such Discovery, planned with such benevolent Views by GEORGE THE THIRD, and executed by Capt. Cook, have not, we trust, totally failed in this Respect. The Natives of the South Pacific Ocean comparing themselves with their Visitors, cannot but be struck with the deepest Conviction of their own Inferiority, and be impelled by the strongest Motives to strive to emerge from it, and rise nearer to a Level with those Britons, who deigned to look upon them, and left behind so many Specimens of their generous and humane Attention. The very Introduction of our useful Animals and Vegetables, by adding fresh Means of Subsistence, will have added to their Comforts and Enjoyments of Life.

The Public Curiosity being excited to the highest Degree respecting Capt. Cook's Three respective Voyages, it is necessary to caution the Public against the Imposition of all mutilated, imperfect, and Spurious Editions, Abridgements, and Compendiums of these Works; such Publications not being calculated to convey to the Reader that Satisfaction so naturally expected. The Work now respectfully offered to the Public, will contain the Whole of Capt. Cook's Voyages Complete, with all the fine splendid Folio Copper-plates. It is unnecessary to point out the obvious Imperfections of all Publications which include only a *single* Voyage of the very celebrated Capt. Cook; his *Three* different Voyages are so immediately connected together, that owing to frequent References from one to another, no Person can form a satisfactory Idea of his valuable Discoveries, who does not read his *First*, *Second*, and *Third Voyages*, in the Order in which they were performed and written: In the present very *Complete*, *improved*, and *genuine Edition* (for which numerous Readers have been waiting with Impatience) we therefore consider it as our indispensable Duty to begin with a full Account of his *First Voyage* round the World; after which we shall record an authentic History of his *Second Voyage* to the South Pole, &c. and then proceed to a faithful and accurate Relation of his much admired *Third* and last Voyage round the Globe, being that principally undertaken for new Discoveries in the Pacific Ocean, &c. &c. and in the Prosecution of which he unfortunately lost his Life.

This Work will be illustrated with all the elegant, splendid, and fine LARGE FOLIO COPPER-PLATES, belonging to his FIRST, SECOND, THIRD and LAST VOYAGES, being Views of Places, Portraits of Persons, and historical Representations of remarkable Incidents during this celebrated Navigator's VOYAGE to the PACIFIC OCEAN; together with all the necessary Maps, Charts, Plans, Draughts, &c. shewing the Tracks of the Ships, and relating to Countries now first discovered, or hitherto but imperfectly known; the Whole (amounting to upwards of TWO HUNDRED and TWENTY most ELEGANT and SUPERB ENGRAVINGS) finely engraved and accurately copied from the Originals by the most eminent Masters. Some other Editions of these Works, unnecessarily

unnecessarily extended to many large Volumes, by loose Printing, &c. and published by mercenary Persons (though ill executed in the Letter-Press particularly) would cost a Purchaser the enormous Sum of upwards of Twenty Guineas; so that many Thousands of Persons who would wish to peruse the valuable Discoveries so partially communicated to the World, and view the astonishing fine Copper-Plates, have hitherto been excluded from gratifying their eager Curiosity; but THIS EDITION is published in only Eighty Numbers at 6d. each, making when completed One Large Handsome Volume in Folio: to effect which very desirable End, Recourse will be had to large new Types, constructed on Purpose to comprise much Matter in a little Compass; so that by this Means, and by our adhering to a close though elegant Mode of Printing, we shall be enabled to present to the Public at an easy Rate, and in a small but sufficient Compass, more than what others have (to enrich private Individuals) extended and spun out by loose Printing, blank Paper, and other sinister Artifices, to the Bulk of many large Volumes, originally fixed at a very high Rate, and, by the selfish Manœuvres of Monopolizers, now advanced to a most extravagant Price; whereby the original Intention of Government, that the Improvements and Discoveries in these celebrated Voyages might be communicated to the Public, (at whose Expence they were not only performed, but also printed and published) has been hitherto, in a great Measure, defeated. However, by the Publication of this Genuine and COMPLETE COLLECTION of the Whole of Captain COOK's VOYAGES, &c. in LARGE FOLIO, all Ranks of Persons whatever may be accommodated, and the Public Curiosity, so naturally excited by the Report of such EXTRAORDINARY VOYAGES and DISCOVERIES, will be immediately and cheaply gratified.—The Poor as well as the Rich will thus become familiarly acquainted with these extraordinary and important Voyages and Discoveries, in the Performance and Prosecution of which such vast Sums of the Public Money have been expended. So that as the Price of THIS WORK is rendered so very moderate and easy, the Whole of Captain Cook's Voyages will be more universally read, and the obvious Intention of the King and Government, that the Improvements and Discoveries in these celebrated Voyages might be communicated to the whole World, will of course be more fully answered.

To the Whole Discoveries and Voyages of CAPTAIN COOK, we mean to add complete and genuine Narratives of other Voyages of Discovery round the World, &c. undertaken, performed, and written by English Circum-Navigators, &c. under the Sanction of Government; viz. those of Lord Byron, Capt. Wallis, Capt. Carteret, Lord Mulgrave, Lord Anson, &c. &c. &c. Including likewise, a faithful Relation of the Substance of all the most remarkable and important Travels and Journeys, which have been undertaken at various Times to the different Quarters of the World, particularly those of Hanway, Hamilton, Herbert, Drummond, Pocock, Shaw, Stuart, Kalm, Carver, Dalrymple, Burnet, Addison, Barretti, Keyfler, Thickness, Twiss, Brydone, Chandler, Johnson, Smollet, Moore, Wraxall, &c.

It has of late become a Mode too common to usher periodical Publications into the World with a good Appearance at first; and, in the Course of their Execution, to fall off from their original Perfection; so that, when concluded, they cannot, properly speaking, for want of Uniformity, be deemed finished. That such Defects will not be the Case in THIS WORK, the Publisher assures the Public, that the latter Numbers will be equal in Goodness with the former; and that the Whole shall be finished in so regular, complete, uniform, and elegant a Manner, as to answer the Wishes both of the Publisher and Readers, by doing Credit to the one, and giving Satisfaction to the other.

To the KING,
To the LORDS COMMISSIONERS of the Admiralty,
To the CAPTAINS and OFFICERS of the Royal Navy,
AND
To the PUBLIC at Large,
The following GENUINE and COMPLETE HISTORY of
The WHOLE of Capt. COOK's VOYAGES, &c.

In large FOLIO, embellished with all the elegant and splendid FOLIO COPPER-PLATES;

IS
MOST HUMBLY DEDICATED,
BY HIS MAJESTY'S

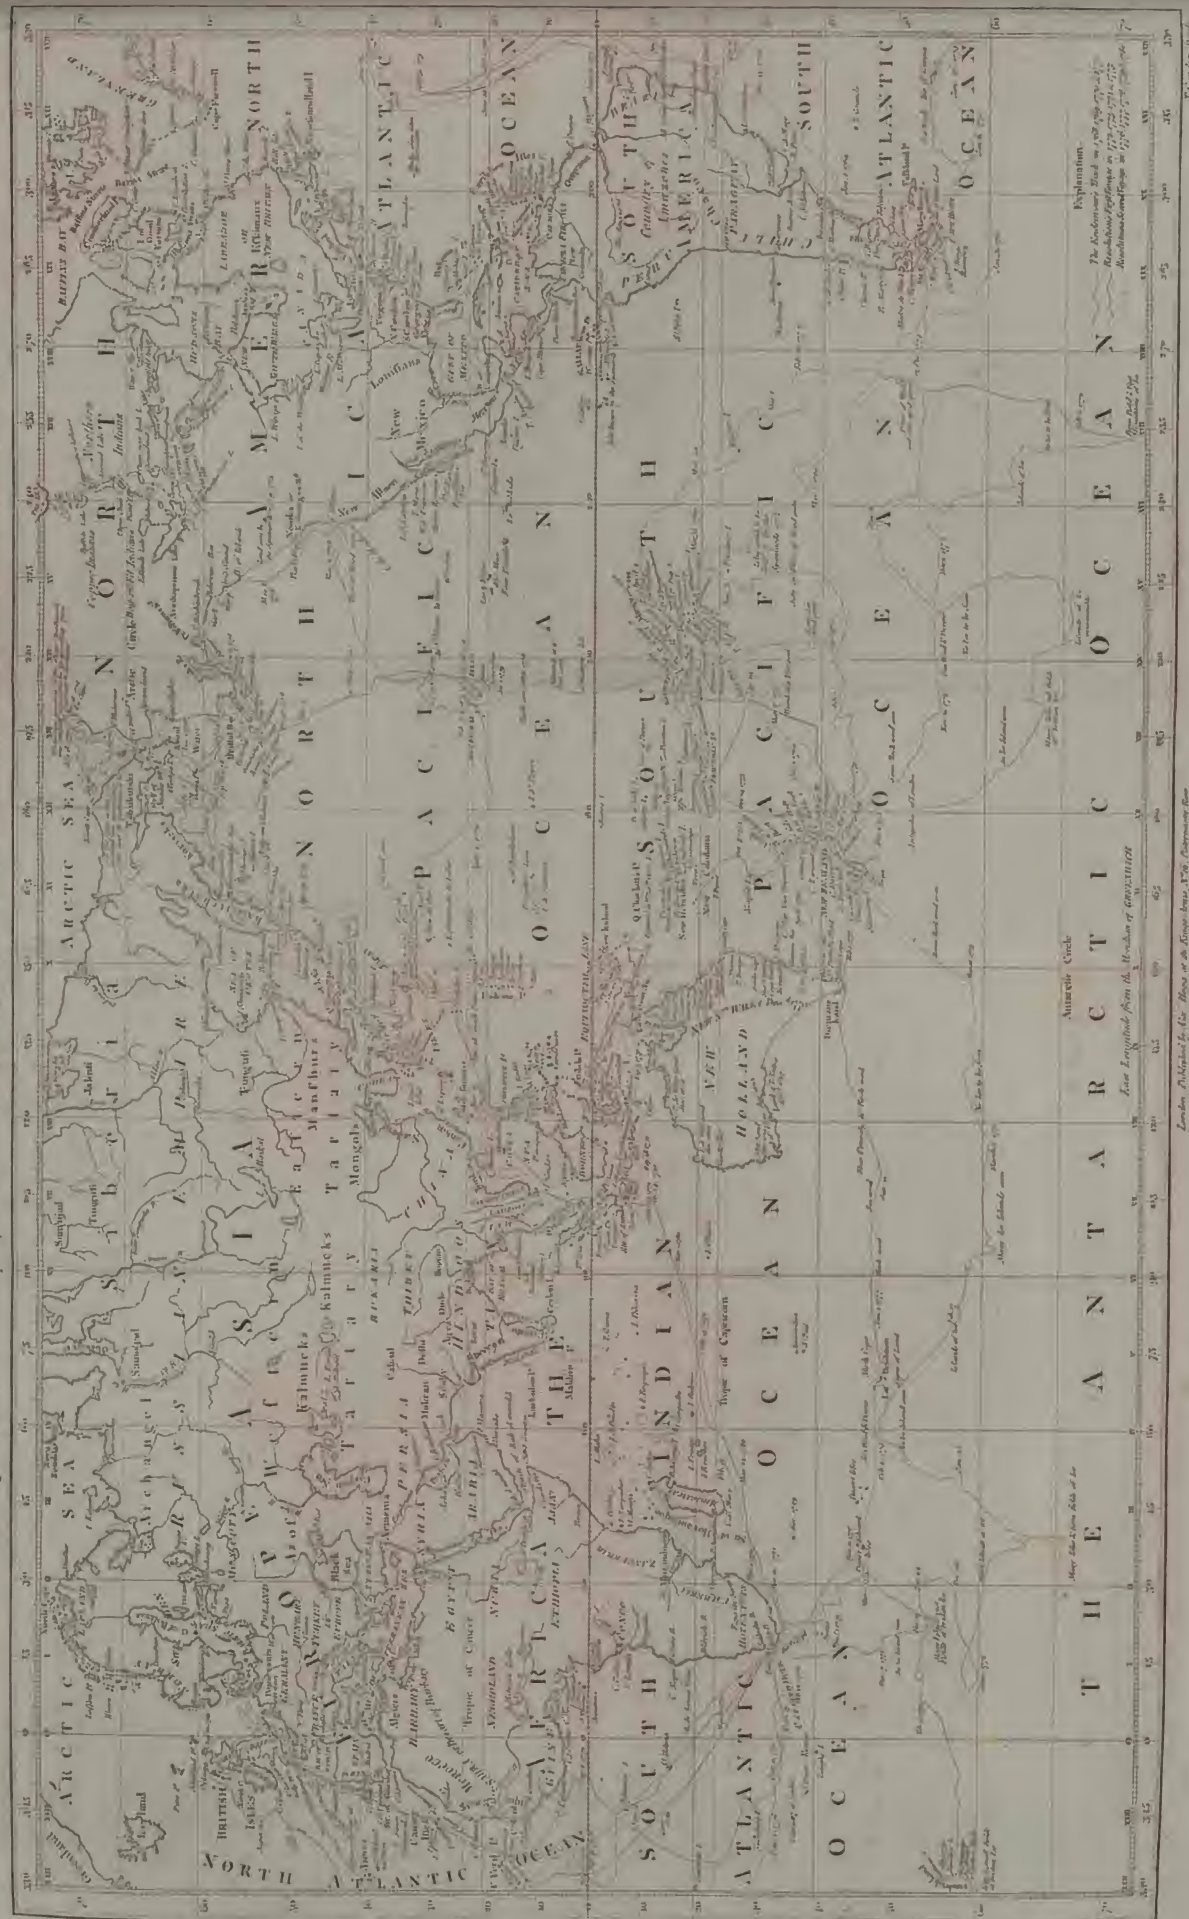

AND
THE PUBLIC'S

MOST OBEDIENT AND DEVOTED SERVANTS,

The EDITOR and PUBLISHER.

A GENERAL CHART:

Exhibiting the Discoveries made by Capt. ZEDLER in his FIRST, SECOND and THIRD VOYAGES; with the TRACKS of the SHIPS under his Command.

LET

A

NEW, GENUINE, and COMPLETE

H I S T O R Y

OF THE WHOLE OF

Capt. Cook's Voyages,

Undertaken and Performed by ROYAL AUTHORITY.

Being the most ACCURATE, ELEGANT, and PERFECT EDITION of the WHOLE WORKS and DISCOVERIES of that Celebrated CIRCUMNAVIGATOR, ever Published.

The Whole Written in a more Pleasing and Elegant Stile than any other Work of the Kind Whatever.

A FULL and SATISFACTORY HISTORICAL ACCOUNT of

Capt. C O O K's

FIRST VOYAGE Round the WORLD,

UNDERTAKEN and PERFORMED

By Order of his Present M A J E S T Y,

In his Majesty's Ship the ENDEAVOUR,

Principally for making Discoveries in the SOUTHERN HEMISPHERE, &c. &c.

Begun the latter End of August 1768, and concluded the 12th of June 1771; Containing a Period of nearly THREE YEARS, in which was completed the Circumnavigation of the Globe.

I N T R O D U C T I O N.

VOYAGES being considered as the grand repository of useful and interesting knowledge, have justly engaged the attention of mankind in all ages. In this ample field the attention of curiosity is gratified by a vast variety of interesting scenes; and works of this kind are of national consequence, while, at the same time, they afford a rich fund of pleasure to all those who delight to spend a leisure hour in rational amusement. With respect to Captain Cook's *First * Voyage* round the World, which was in the ENDEAVOUR, it has so much attracted the notice of the world, that it cannot be too particularly related, nor too nicely examined; and a principal advantage accruing from the following Narrative is, that the same stories, set in different lights, as they strike the observer, cannot fail of being a source of fresh intelligence; of shewing former accounts through a new medium, and of placing them in a more striking point of accuracy, by judicious corrections, and additional improvements.

The voyage which is the subject of our present Narra-

tive, was undertaken by order of his present Majesty, for making Discoveries in the Southern Hemisphere, &c. Captain Cook was appointed Commander of the Endeavour; and with him embarked Mr. (now Sir Joseph) Banks and Dr. Solander, whose principal objects in this expedition were, to observe the Transit of Venus, and to attempt afterwards farther discoveries. Mr. Joseph Banks and Dr. Solander were men of distinguished abilities. The first of these gentlemen was possessed of considerable landed property in Lincolnshire; and, upon his leaving the University of Oxford, A. D. 1763, he made a voyage to the coast of Newfoundland and Labradore. Notwithstanding the dangers and difficulties that attended his first expedition, Mr. Banks returned undiscouraged; and when the Endeavour was equipping for a voyage to the South Seas, he determined to embark with the adventurers, from the laudable motive of enriching his native country with the knowledge of unknown productions, and new discoveries.

* It is unnecessary to point out the obvious Imperfections of all spurious Publications, and mere Abridgements, which include only a single voyage of the very celebrated Capt. Cook. Indeed his *Three* different Voyages are so immediately connected together, that owing to frequent references from one to another, no person can possibly form a satisfactory idea of his valuable Discoveries, who does not read his *First*, *Second*, and *Third Voyages* in the regular order in which they were performed and written: in the present very *Complete*, *Improved*, and *Genuine Edition* (for which numerous readers have been waiting with impatience) we therefore consider it as our indispensable duty to begin with a full account of his *First Voyage*; after which we shall record an authentic History of his *Second Voyage*; and then proceed to a faithful and accurate relation of his much admired *Third and Last Voyage* Round the World, being that principally undertaken for making new Discoveries in the Pacific Ocean, &c. &c. and in the prosecution of which he unfortunately lost his valuable life.

Dr. Solander, whom Mr. Banks engaged to accompany him, had been appointed to a place in the British Museum, then just established, which he filled with credit to himself, and in which he gave universal satisfaction. The Doctor was a native of Sweden, and a man of great learning, being an adept in natural philosophy, and who had studied under the famous Linnæus. Mr. Banks, besides the important and valuable acquisition of this gentleman, took with him two draughtsmen, the one being intended to paint subjects of natural history, and the other to delineate figures and landscapes. He had likewise four servants, two of whom were negroes, and a secretary in his retinue. Both Capt. Cook and Mr. Banks kept accurate and circumstantial journals of this voyage. The papers of Captain Cook contained a minute account of all nautical incidents, and a very particular description of the figure and extent of the countries he had visited; and in those of Mr. Banks were found a great variety of incidents which had not come under the inspection of Capt. Cook; besides, some officers, and the more intelligent of the ship's crew, have communicated to their friends duplicates of their journals, as well as innumerable natural and artificial curiosities, with descriptions of the people and countries, their productions, manners, customs, religion, policy, and language.

Materials so interesting and copious, will be thought quite sufficient to furnish the public with the following New and Complete History of the Whole of Capt. Cook's Voyages; in which will be contained many curious remarks made by several gentlemen engaged in these celebrated expeditions; and it is our intention to place every important incident in various points of view, that our readers may be complete judges of the valuable nature of the New Discoveries, and of the preference which is due to this Large, Elegant, though Cheap Edition.

The preparations for this important work have been suitable to its inestimable value, and our earnest concern for its credit; while wealth and science have united their powers for the purposes of public benefit. Many of the first literary characters of the age have favoured us with their assistance; not only the great outlines of nature, but the variety of shades within have been carefully attended to, and not a single material will be neglected which may embellish the narratives, and give life and beauty to all the *Three respective Voyages* of this unparalleled Navigator. We therefore submit this Noble Undertaking to the judgment of the public, founding our claims to their favour on MERIT ALONE, knowing it is only on THIS solid foundation we can hope and expect their encouragement and protection.

B O O K I.

C H A P. I.

The Departure of the Endeavour from Plymouth—Her passage to the island of Madeira—A description of its natural curiosities and trade—A particular account of Funchiale, the capital of Madeira—The passage from Madeira to Rio de Janeiro—An account of this Capital of the Portuguese dominions in South America, and of the circumjacent country—Incidents that happened while the Endeavour lay in the harbour of Rio de Janeiro.

A. D. 1768. **T**HE Endeavour, a bark of three hundred and twenty tons, which had been originally built for the Coal trade, was appointed to the service of Capt. Cook's first voyage round the world, having on board ten carriage and twelve swivel guns. On August the 26th we therefore got under sail, and took our departure from Plymouth. On the 31st, we saw several of those birds, called by seamen Mother Carey's Chickens, and which they think prognosticate a storm. On the 2d of September we saw land between Cape Finisterre, and Cape Ortegal, on the coast of Galicia in Spain. In this course some marine animals were discovered, hitherto unnoticed by naturalists. One of these, described as a new species, is of an angular form, near three inches in length, and one thick. It has a hollow passage quite through it, and a brown spot at one end. Four of these animals appeared to adhere together by their sides; but when put into water, they separated, and swam about, shining with a brightness resembling the vivid colour of a gem. We also discovered another animal, exceeding in variety and brightness any thing we had seen; even in colour and splendour equal to those of an opal. At the distance of about ten leagues from Cape Finisterre, we caught among the rigging of the ship several birds not described by Linnæus. On the 12th we discovered Puerto Santo, and Madeira, and, on the day following, moored with the stream anchor in the road of Funchiale. In heaving up the anchor, Mr. Weir, the master's mate, was unfortunately carried overboard and drowned.

Upon approaching the island of Madeira from the sea, it appears exceedingly beautiful, the sides of the hills being covered with plantations of vines, which are green when all kinds of herbage, except here and there, are burnt up, which was the case at this time.

On the 13th, in the forenoon, the boat came from the officers of health, no one being suffered to land from on board a ship without their permission. When this was granted, we landed at Funchiale, the chief

town in the island, and proceeded directly to the house of Mr. Cheap, a considerable merchant, and, at that time, the English consul there, who received us with a brotherly kindness, and treated us with a princely liberality. We continued on the island only five days, during which time the season was the worst in the year for searching after natural curiosities; however, the two gentlemen, Dr. Solander and Mr. Banks, pushed their excursions about three miles from the town, and collected a few plants in flower, by the obliging attention of Dr. Heberden, the chief physician of the island, and brother to Dr. Heberden of London. Mr. Banks enquired after and found the tree called *Laura Indicus*, the wood of which he supposes to be what is called the Madeira mahogany, as there is no real mahogany upon the island.

The inhabitants of Madeira have no other article of trade than wine, which is made by pressing the juice out in a square wooden vessel. The size of this is proportioned to the quantity of wine; and the servants having taken off their stockings and jackets, get into it, and with their elbows and feet press out as much of the juice as they can. In like manner the stalks, being tied together, are pressed under a square piece of wood, by a lever with a stone fastened to the end of it.

During our stay upon this island we saw no wheel-carriages of any sort, nor have the people any thing that resembles them, except a hollow board, or sledge, upon which those wine vessels are drawn that are too big to be carried by hand. They have also horses and mules, very proper for their roads, but their wine is, notwithstanding, brought to town from the vine-yards where it is made, in vessels of goat-skins, which are carried by men on their heads.

Nature has been very liberal in her gifts to Madeira. The inhabitants are not without ingenuity, but they want industry. The soil is so very rich, and there is such a variety in the climate, that there is scarcely any article either of the necessaries or luxuries of life,

which cannot probably be cultivated here. On the hills walnuts, chefnuts, and apples flourish, almost without culture. Pine-apples, mangoes, guanas, and bananas, grow almost spontaneously in the town. They have corn which is large grained and fine, and it might be produced in plenty; but for want of being attended to, all they consume is imported from other countries. Beef, mutton, and pork are remarkably good, and the captain took some of the former on board for his own use.

Funchiale (which took its name from *Foncho*, signifying fennel in the Portuguese language) is situate at the bottom of a bay, and though it is extensive in proportion to the rest of the island, it is but poorly built, and the streets are narrow and badly paved. The churches are full of ornaments, with pictures and images of saints; the first are, for the most part, wretchedly executed, and the latter are dressed in laced cloaths. The taste of the convents, especially of the Franciscans, is better; neatness and simplicity being united in most of the designs of the latter. The infirmary also is a piece of good architecture, and one of the most considerable in this place. In this convent is a small chapel, the whole lining of which, both sides and ceiling, is composed of human skulls and thigh bones; the thigh bones are laid across each other, and a skull is placed in each of the four angles. When we visited the good fathers, just before supper-time, they received us with great civility. "We will not ask you," said they, "to supper with us, because we are not prepared, but if you will come to-morrow, though it is a fast-day, we will have a turkey roasted for you." This polite invitation it was not in our power to accept. There are many high hills in this island; Pico Ruivo in particular is near 5100 feet high. To a certain height these hills are covered with vines, above which are numbers of chefnuts and pine-trees; and above these again whole forests of various sorts of trees. The *Mirmulano* and *Paobranco* which are found among them, are unknown in Europe. The latter of these is very beautiful, and would be a great ornament to our gardens. The number of inhabitants in Madeira are computed to amount to about eighty thousand; and the custom-house duties produce to the king of Portugal a revenue of 20,000*l.* a year, clear of all expences. But the balance of trade is against the people; for all their money going to Lisbon, the currency of the island is in Spanish. This coin consisteth of pistereens, worth about a shilling; bitts about sixpence, and half bitts worth about three-pence.

On the 19th of September the *Endeavour* sailed from Madeira, and on the 21st we saw the islands called the Salvages, northward of the Canaries. The principal of these was about five leagues to the south half west. On the 23d the Peak of Teneriffe bore west by south half south. Its appearance at sun-set was very striking; for when most part of the island appeared of a deep black, the mountain still reflected rays, and glowed with a warmth of colour which no painting can express. There is no eruption of visible fire, but a heat issues from the chinks near the top, too strong to be borne by the hand when held near them. The height of this mountain is 15,396 feet, which is but one hundred and forty-eight yards less than three miles.

On the 30th we saw Bona Vista, one of the Cape de Verd Islands, in latitude 16 deg. north, and longitude 21 deg. 51 min. west. In our course to Teneriffe, we observed numbers of flying fish, which appeared very beautiful, their sides resembling burnished silver.

On the 7th of October Mr. Banks went out in a boat, and caught what our sailors call a Portuguese man of war; together with several shell fishes, or testaceous animals, which are always found floating upon the water; and on the 25th this gentleman shot a black-toed gull, not described by Linnæus, and whose dung is of a red colour. We had now variable winds, with some showers of rain, and the air was so damp as to damage our utensils considerably.

On the 25th we crossed the line with the usual ceremonies; and on the 28th when the ship was in the la-

titude of Ferdinand Noronha, longitude 32 deg. 5 min. west, we began to look out for the island, and for the shoals which are laid down as lying between it and the main; but neither the island nor shoals could be discovered. On the 29th we perceived that luminous appearance of the sea mentioned by navigators, which emitted rays like those of lightening. As Mr. Banks and Dr. Solander were not thoroughly satisfied with any of the causes hitherto assigned for this phenomenon, and supposing it was occasioned by some luminous animals, they threw out a casting net, in order to try by experiment whether they were right in their conjectures. A species of the *Medusa* was taken, which bore some resemblance to metalline substance greatly heated, and emitted a whitish light; they caught also some crabs which glittered very much; animals which had not before been taken notice of by the curious researchers into the secrets of nature.

As provisions by this time began to grow short, we resolved to put into the harbour of Rio de Janeiro; and on the 8th of November we saw the coast of Brasil. Upon speaking with the crew of a Portuguese fishing boat, we were informed by them, that the land which we saw was to the south of Santo Espirito. Mr. Banks, having bought of these people some fish, was surprized, that they required English shillings: he gave them two which he happened to have about him; for he imagined Spanish silver to have been the only currency, and it was not without some dispute that they took the rest of the money in pistereens. The fresh fish which was bought for about nineteen shillings, served the whole ship's company. We stood off and on along shore till the 12th, having in view successively Cape Thomas and an island just without Cape Frio, and then made sail for Rio de Janeiro on the 13th in the morning. Capt. Cook sent his first lieutenant in the pinnace before to the city, to inform the governor, that we had put into that port in order to procure refreshments, and a pilot to bring us into proper anchoring ground. The pinnace returned, but the lieutenant had been detained by the viceroy, till the captain should come on shore. When the ship had come to an anchor, a ten oared boat filled with soldiers approached, and rowed round her, but no conversation took place. Afterwards another boat appeared, which had several of the viceroy's officers on board. They enquired from whence the *Endeavour* came? what was her cargo? what number of men and guns she carried? and to what port she was bound? which questions having been punctually and truly answered, the Portuguese officers apologized for having detained the lieutenant, and pleaded the custom of the place in excuse for their behaviour.

On the 14th Captain Cook went on shore, and obtained leave to furnish the ship with provisions; but this permission was clogged with the conditions of employing an inhabitant as a factor, and of sending a soldier in the *Endeavour's* boat every time she came from shore to the vessel. To these uncivil terms the Captain made many objections; but the viceroy was determined to insist on them, neither would he permit Mr. Banks and Dr. Solander to remain on shore, nor suffer the former to go up the country to collect plants. Captain Cook conceiving from these and other marks of jealousy, that the viceroy thought they were come to trade, used all his endeavours to convince him of the contrary; and acquainted him, that they were bound to the South Seas, to observe the transit of Venus over the disk of the sun, an object of great consequence to the improvement of navigation; but the viceroy by his answer seemed to be entirely ignorant of this phenomenon. An officer was now appointed to attend the captain, which order he was desired to understand as an intended compliment: however, when he would have declined such a ceremony, the viceroy very politely forced it upon him.

Dr. Solander and Mr. Banks were not a little chagrined on hearing that they would not be permitted to reside on shore, and still more so when they understood, that they were not even allowed to quit the ship: for the

the viceroy had ordered, that the captain only, with such sailors as were required by their duty, should come on shore. Whether this arose from his jealousy in regard to trade, or from the apprehensions he entertained of the extraordinary abilities of the two gentlemen in search of new discoveries, it is certain that they were highly disagreeable to Mr. Banks and the Doctor, who were resolved, if possible, to evade the order. With this view they attempted to go on shore, but were stopped by the guard-boat; yet several of the crew, without the knowledge of the captain, let themselves down by a rope from the cabin window into the boat about midnight, and drove away with the tide, till they were out of hearing. They afterwards landed on an unfrequented part of the country, and were treated by the inhabitants with great civility.

Capt. Cook, uneasy under the restrictions of the viceroy, remonstrated with him, but the latter would return no other answer, than that the king his master's orders must be obeyed. The Captain, thus repulsed, and much displeased, resolved to go no more on shore, rather than, whenever he did so, to be treated as a prisoner in his own boat; for the officer who was so polite as to accompany him, constantly attended him, both to and from the shore. Two memorials were now drawn up and presented to the viceroy, one written by the captain, and the other by Mr. Banks; but the answers returned were by no means satisfactory. Several papers passed between them and the viceroy to no good purpose, the prohibition still remaining as before; from whence the captain thought it necessary, in order to vindicate his own compliance, to urge the viceroy to an act of force in the execution of his orders. For this purpose he sent lieutenant Hicks with a packet, giving him his order not to admit of a guard in his boat. As this gentleman was resolved to obey his captain's commands, the officer of the guard-boat did not oppose him by force, but acquainted the viceroy with what had happened, on which the lieutenant was sent away with the packet unopened. When returned, he found a guard of soldiers placed in the boat, and insisted on their quitting it. Whereupon the officer seized the boat's crew and conducted them under an escort to prison, and the lieutenant was sent back to the ship guarded. When the captain was informed of this transaction, he wrote to the viceroy to demand his boat and her crew, inclosing the memorial which Mr. Hicks his lieutenant had brought back. These papers he sent by a petty officer to avoid continuing the dispute concerning the guard, which must have been kept up by a commissioned officer. An answer was now promised by the viceroy; but before this could arrive, the long-boat, which had four pipes of rum on board, was driven to windward, (the rope breaking that was thrown from the ship,) together with a small skiff that was fastened to the boat. Immediate orders were given for manning the yawl, which, being dispatched accordingly with proper directions, returned, and brought the people on board the next morning; from whom Captain Cook learned, that the long-boat having filled with water, they had brought her to a grapple and quitted her, and falling in with a reef of rocks on their return, they were forced to cut the fastening of Mr. Banks's little boat, and send her adrift. The captain now dispatched another letter to his excellency, wherein he informed him of the accident, desired he would assist him with a boat to recover his own, and, at the same time, renewed his demand of the delivery of the pinnace and her crew. The viceroy granted the request, but in his answer to the captain's remonstrance, suggested some doubts that he entertained, whether the *Endeavour* was really a king's ship, and also accused the crew of smuggling. Capt. Cook, in his reply, said, that he was willing to shew his commission, adding, if any attempt should be made to carry on a contraband trade, he requested his excellency would order the offender to be taken into custody. The dispute being thus terminated, Mr. Banks attempted to

elude the vigilance of the guard, which he found means to do, and got safe on shore on the 26th, in the morning. He took care to avoid the town, and passed the day in the fields, where he could best gratify his curiosity. Mr. Banks found the country people inclined to treat him with civility, and was invited to their habitations. But it was afterwards heard, that search had been making for this gentleman when absent. He and Dr. Solander, therefore, resolved to run no more risks in going on shore, while they remained at this place.

On the 1st of December, having taken in water and provisions, we got, with leave from the viceroy, a pilot on board, but the wind prevented us from putting to sea. A Spanish packet from Buenos Ayres, bound for Spain, arriving the next day, the captain of her with great politeness offered to take our letters to Europe. The favour was accepted, and Captain Cook delivered into his hands a packet for the secretary of the Admiralty, containing copies of all the papers that had passed between him and the viceroy, leaving the duplicates with his excellency. On the 5th we weighed anchor, and towed down the bay, but were stopped at Santa Cruz, the principal fortification, the order from the viceroy to let us pass, by an unaccountable negligence, not having been sent; so that it was not till the 7th that we got under sail. When we had passed the fort the guard-boat left us, and our pilot was discharged. It was observed, during our stay in this harbour, that the air was filled with butterflies, chiefly of one kind, and the greatest part above our mast-head. Of the town and neighbouring country we shall give the following description.

Rio de Janeiro was probably so called because discovered on the festival of St. Januarius, from whence we may suppose the river Januarius took its name, and also the town, which is the capital of the Portuguese in America. This town is situated on the west side of the river, from which it is extended about three quarters of a mile. The ground whereon it stands is a level plain. It is defended on the north side by a hill, that extends from the river, having a small plain which contains the suburbs and king's dock. On the south is another hill running towards the mountains which are behind the town. This is neither ill designed nor ill built; the houses in general are of stone, and two stories high; every house having, after the manner of the Portuguese, a small balcony before its windows, and a lattice of wood before the balcony; its circuit is about three miles; and it appears to be equal in size to the largest country towns in England. The streets are straight, and of a convenient breadth, intersecting each other at right angles; the greater part, however, lie in a line with the citadel, called St. Sebastian, which stands on the top of a hill that commands the town. The principal street is near 100 feet in width, and extends from St. Benedict to the foot of Castle-hill. The other streets are commonly twenty or thirty feet wide. The houses adjoining to the principal street are three stories high, but in other places they are very irregular, though built after the same manner as at Lisbon. Water is conveyed to a fountain in the great square, from an aqueduct, raised upon two stories of arches. The water at this fountain, however, is so bad, that we could not drink it with pleasure. The churches are richly ornamented, and there is more religious parade in this place than in any of the popish countries in Europe. Not a day passes without a procession of some parish, with various insignia, splendid and costly in the highest degree. But the inhabitants may pay their devotions at the shrine of any saint, without waiting for a procession; for a small cupboard, having a glass window, and in which is one of these tutelary gods, is placed before almost every house, and a lamp is kept constantly burning, lest the old proverb should be verified, "Out of sight, out of mind." Before these saints the people pray and sing with such vehemence, that in the night they were distinctly heard by our sailors on board the ship.

In this town are four convents, the first is that of the Bene-

Benedictines, situated near its northern extremity: the structure affords an agreeable prospect, and contains an elegant chapel, ornamented with several valuable paintings: The second is that of the Carmelites, which forms the centre angle of the royal square, and fronts the harbour; its church was rebuilding in a very elegant manner, with fine free stone, brought thither from Lisbon. The third is that of St. Anthony, situated on the top of a hill, on the south side of the town; before this convent stands a large basin of brown granite, in the form of a parallelogram, which is employed in washing. The fourth is situated at the eastern extremity of the town, and was formerly the Jesuits convent, but is now converted into a military hospital.

In the right angle of the royal square stands the viceroy's palace; this, with the mint, stables, goal, &c. compose one large building, which has two stories, and is 90 feet from the water. In passing through the palace, the first entrance is to a large hall or guard-room, to which there is an ascent of three or four steps. In the guard-room are stationed the viceroy's body-guards, who are relieved every morning between eight and nine; and adjoining to the hall are the stables, the prison being in the back part of the building. Within the guard-room is a flight of stairs for ascending to the upper story, which divides at a landing-place about half way, and forms two branches, one leading to the right and the other to the left. The former leads to a saloon, where there are two officers in constant attendance; the viceroy's aid-de-camp at the same time waiting in the anti-chamber to receive messages and deliver orders.

The left wing of the royal square is an irregular building, which consists chiefly of shops, occupied by trading people. In the centre of this square is the fountain, of which we have made mention, as being supplied with water from a spring at the distance of three miles, from which it is brought by an aqueduct. The place is continually crowded with negroes of both sexes waiting to fill their jars. At the corner of every street is an altar. The market-place extends from the north-east end of the square along the shore, and this situation is very convenient for the fishing-boats, and those who bring vegetables from the other side of the river to market. Negroes are almost the only people who sell the different commodities exposed in the market, and they employ their leisure time in spinning cotton.

The form of government is in its constitution mixed, but in fact very despotic; the viceroy and civil magistrate of the town frequently committing persons to prison, or transporting them to Lisbon, at their own pleasure. In order to prevent the people from making excursions into the country, in search after gold and diamonds, certain bounds are prescribed them, sometimes at a few, and sometimes at many miles distance from the town; and if a man is taken up by the guard without the bounds, where they constantly patrol, he is immediately sent to prison.

The inhabitants of Rio de Janeiro are exceeding numerous, and consist of Portuguese, Negroes, and Indians, which last were the original natives of the country. The township of Rio is but a small part of the Capitanea or province; yet is said to contain 37,000 white people, and 629,000 blacks, many of whom are free, making together 666,000, in the proportion of 17 to 1.

The military is composed of twelve regiments of regular troops, six being Portuguese, and six Creoles, and twelve regiments of provincial militia. The inhabitants are servilely submissive to the regulars, and it has been said, that if any of them should omit the compliment of taking off his hat, when he meets an officer, he would be immediately knocked down. But the subordination of the officers to the viceroy is equally mortifying, for they are obliged to wait three times every day to know, or receive his commands: the answer frequently is, "there is nothing new."

In Rio de Janeiro the gentry keep their chaises, which are drawn by mules; the ladies however use a sedan

No. 1.

chair, boarded before and behind, with curtains on each side, which is carried by two negroes on a pole connected with the top of the chair by two rods, coming from under its bottom, one on each side, and resting to the top. The apothecaries shops commonly serve the purposes of coffee-houses, as the people meet in them to drink capillaire, and play at back-gammon. When the gentry are seen abroad, they are well dressed, though at home but loosely covered. The shopkeepers have generally short hair, and wear linen jackets with sleeves. The women in general, as in most of the Portuguese and Spanish settlements in South America, are more ready to grant amorous favours than those of any other civilized parts of the world. As soon as the evening began, females appeared at the windows on every side, who distinguished such of the men as best pleased their fancies, by throwing down nosegays: and Dr. Solander and two other gentlemen received so many of these love tokens, that they threw them away by hat-fuls.

Without the Jesuits college on the shore, is a village called Neutra Senhora del Gloria, which is joined to the town by a very few intervening houses. Three or four hundred yards within the Jesuits college, stands a very high castle, but it is falling to decay. The bishop's palace is about three hundred yards behind the Benedictine convent, and contiguous to it is a magazine of arms, surrounded by a rampart.

The inhabitants of Rio de Janeiro maintain a whale-fishery, which supplies them with lamp oil. They import brandy from the Azores, and their slaves and East India goods from their settlements in Africa, their wine from Madeira, and their European goods from Lisbon. The current coin is Portuguese, which is struck here; the silver pieces are called petacks, of different value; and the copper are five and ten ree pieces: This place is very useful for ships that are in want of refreshment. They water, as we have before observed, at the fountain in the great square, but the water is not good. We landed our casks on a smooth sandy beach, which is not more than a hundred yards distant from the fountain, and, upon application to the viceroy, a centinel is appointed to look after them. The harbour is safe and commodious, and distinguished by a remarkable hill, in the shape of a cone, at the west point of the bay. The entrance is not wide, but it is easy, from the sea-breeze which prevails from noon to sun-set, for any ship to enter before the wind. The entrance of the narrow part is defended by two forts, La Cruz, and Lozia; they are about three quarters of a mile from each other. The bottom being rocky, renders it dangerous to anchor there, but, to avoid it ships must keep in the mid-channel. The coast abounds with a variety of fish, among which are dolphins and mackarel. Provisions, except wheaten bread and flour, are easily procured. Yams and cassada are in plenty. Beef, both fresh and jerked, may be bought at two-pence farthing a pound, but it is very lean. The people jerk their beef, by taking out the bones, and cutting it into large but thin slices. They then cure it with salt, and dry it in the shade. It eats very well, and, if kept dry, will remain good a long time at sea. Mutton is scarcely to be procured. Hogs and poultry are dear. Garden-stuff and fruit are in abundance, but the pumpkin only can be preserved at sea. Tobacco also is cheap, though not good. Rum, sugar, and molasses are all excellent, and to be had at reasonable prices.

The climate of Rio de Janeiro is healthy, and free from most of those inconveniencies incident to tropical countries. The air is seldom immoderately hot, as the sea breeze is generally succeeded by a land wind. The seasons are divided into dry and rainy, though their commencement of late has been irregular and uncertain, for the latter had failed for near four years preceding our arrival; but at this time the rain had just began, and fell in heavy showers during our stay: formerly the streets have been overflowed by the rain, and rendered impassable with canoes.

C

The

The adjacent country is mountainous, and chiefly covered with wood, a small part of it only being cultivated. Near the town the soil is loose and sandy, but farther from the river it is a fine black mould. It produces all the tropical fruits in great plenty, and without much cultivation; a circumstance exceeding agreeable to the inhabitants, who are very indolent. The mines, which lie far up in the country, are very rich. Their situation is carefully concealed, and no one can view them, except those concerned in working and guarding them. About twelve months before our

arrival, the government had detected several jewellers in carrying on an illicit trade for diamonds, with slaves in the mines; and immediately afterwards a law passed, making it felony to work at the trade, or to have any tools fit for it in possession, the civil officers having indiscriminately seized on all that could be found. Near 40,000 negroes are annually imported to dig in the mines, so pernicious to the human frame are those works. In 1776, 20,000 more were draughted from the town to supply the deficiency of the former number.

C H A P. II.

The departure of the Endeavour from Rio de Janeiro—Her passage to the entrance of the Streight of Le Maire—The inhabitants of Terra del Fuego described—Mr. Banks and Dr. Solander ascend a mountain in search of plants—An account of what happened to them in this excursion—The Endeavour passes through the Streight Le Maire—An account of her passage, and a further description of the inhabitants of Terra del Fuego, and its productions—Remarks respecting the south east part of Terra del Fuego, and the Streight of Le Maire—Directions for the passage westward round this part of America, into the South Seas—The passage of the Endeavour from Cape Horn to the newly discovered islands—An account of their figure and appearance—The inhabitants described, with a narrative of the various incidents during the course, and on the Endeavour's arrival among them.

ON the 8th of December, having procured all necessary supplies, we took our departure from Rio de Janeiro; and on the 9th an amazing number of atoms were taken out of the sea. These were of a yellowish colour, and few of them were more than the fifth part of an inch long; nor could the best microscope on board the Endeavour discover whether they belonged to the vegetable or animal creation. The sea was tinged in such a manner with these equivocal substances, as to exhibit broad streaks of a similar colour, for near the space of a mile in length, and for several hundred yards in breadth. Whence they came, or for what designed, neither Mr. Banks nor Dr. Solander could determine. Perhaps they might be the spawn of some marine animal, unknown to either ancient or modern philosophers.

On the 11th we hooked a shark. It proved to be a female. When opened we took six young ones out of it, five of which were alive, and swam briskly in a tub of water, but the sixth appeared to have been dead some time. From this time we met with no material occurrence till the 22d, when we discovered numerous birds of the procellaria kind, in latitude 39 deg. 37 min. south, and longitude 49 deg. 16 min. west; we also discovered great numbers of porpoises of a singular species, about 15 feet in length, and of an ash colour. On the 23d we observed an eclipse of the moon; and about seven o'clock in the morning, a small white cloud appeared in the west, from which a train of fire issued, extending itself westerly: about two minutes after we heard two distinct loud explosions, immediately succeeding each other, like those of cannon, after which the cloud disappeared. On the 24th we caught a large loggerhead tortoise, weighing one hundred and fifty pounds. We likewise shot several birds, one an albatross, which measured between the tips of its wings nine feet and an inch, and from its beak to the tail two feet one inch and an half. On the 30th we ran upwards of fifty leagues, through vast numbers of land insects, some in the air, and others upon the water; they appeared to resemble exactly the flies that are seen in England, though they were thirty leagues from land, and some of these insects are known not to quit it beyond three yards. At this time we judged ourselves to be nearly opposite to the bay called Sans Fond (without bottom) where it is supposed by some writers, that the continent of America is divided by a passage: but it was the opinion of our circumnavigators, that there might be a large river, which probably had occasioned an inundation. On the 31st we had much thunder, lightning and rain. This day and the three following, we saw several whales; likewise a number of birds

about the size of a pigeon, with white bellies and grey beaks.

On the 3d of January we saw the appearance of land, in latitude 47 deg. 17 min. south, A.D. 1769: and longitude 61 deg. 29 min. 45 sec. In appearance it so much resembled land, that we bore away for it; and it was near two hours and an half before we were convinced, that it was one of those deceptions which sailors call a Fog-bank. At this time our seamen beginning to complain of cold, they were furnished with a pair of trowsers, and a Magellanic jacket, made of a thick woollen stuff called Fearnought. On the 11th, after having passed Falkland's Island, we saw the coast of Terra del Fuego, at the distance of about four leagues from the west to south-east by south. As we ranged along the shore to the south-east, smoke was perceived, made, probably, by the natives as a signal, for it was not to be seen after we had passed by.

On the 14th we entered the streight of Le Maire, but were afterwards driven out again with such violence, (the tide being against us) that the ship's bow-sprit was frequently under water. At length, however, we got anchorage in a small cove, on the east of Cape St. Vincent, the entrance to which our captain named St. Vincent's Bay. The weeds which grow here upon rocky ground are very remarkable, they appear above the surface in eight and nine fathoms water. The leaves are four feet in length, and many of the stalks, though not more than an inch and a half in circumference, above one hundred.

Dr. Solander and Mr. Banks went on shore, where having continued four hours, they returned about nine in the evening, with upwards of an hundred different plants and flowers, of which none of the European botanists had taken any notice near this bay. The country in general was flat, and the bottom, in particular, was a grassy plain. Here was plenty of wood, water, and fowl, and winter bark was found in great plenty. The trees appeared to be a species of the birch, but neither large nor lofty. The wood was white, and they bore a small leaf. White and red cranberries were found in these parts.

On the 18th we came to an anchor in twelve fathom water, upon coral rocks, before a small cove, at the distance of about a mile from the shore. At this time two of the natives came down upon the beach, as if they expected that the strangers would land; but as there was no shelter here, the ship was got under sail again, and the Indians retired disappointed. The same afternoon about two o'clock, we came into the bay of Good Success, and the vessel coming to an anchor, the captain went

went on shore, accompanied by Mr. Banks and Dr. Solander, in order to search for a watering place, and discourse with the Indians. These gentlemen had not proceeded above one hundred yards before the captain, when two of the Indians that had seated themselves, rose up, and threw away the small sticks which they held in their hands, as a token of amity. They afterwards returned to their companions, who had remained at some distance behind them and made signs to their guests to advance, whom they received in a friendly though uncouth manner. In return for their civility, some ribbands and beads were distributed among them. Thus a sort of mutual confidence was established, and the rest of the English joined the party, the Indians conversing with them in their way, in an amicable manner. Capt. Cook and his friends took three of them to the ship, dressed them in jackets, and gave them bread and other provisions, part of which they carried on shore with them; but they refused to drink rum or brandy, making signs that it burned their throats, as their proper drink was water. One of these people made several long and loud speeches, but no part of them was intelligible to any of us. Another stole the covering of a globe, which he concealed under his garment that was made of skin. After having remained on board about two hours, they returned on shore, Mr. Banks accompanying them. He conducted them to their companions, who seemed no way curious to know what their friends had seen, and the latter were as little disposed to relate as the former were to enquire. None of these people exceeded five feet ten inches in height, but their bodies appeared large and robust, though their limbs were small. They had broad flat faces, high cheeks, noses inclining to flatness, wide nostrils, small black eyes, large mouths, small, but indifferent teeth, and straight black hair, falling down over their ears and foreheads, the latter being generally smeared with brown and red paints, and like all the original natives of America, they were beardless. Their garments were the skins of seals and guanicoes, which they wrapped round their shoulders. The men likewise wore on their heads, a bunch of yarn which fell over their foreheads, and was tied behind with the sinews or tendons of some animals. Many of both sexes were painted on different parts of their bodies with red, white, and brown colours, and had also three or four perpendicular lines pricked across their cheeks and noses. The women had a small string tied round each ankle, and each wore a flap of skin fastened round the middle. They carried their children upon their backs, and were generally employed in domestick labour and drudgery.

Mr. Banks and Dr. Solander, attended by their servants, set out from the ship on the 16th, with a design of going into the country as far as they could that day, and returning in the evening. Having entered a wood, they ascended a hill, through a pathless wilderness till the afternoon. After they had reached what they took for a plain, they were greatly disappointed to find it a swamp, covered with birch, the bushes interwoven, and so inflexible that they could not be divided: however, as they were not above three feet high, they stepped over them, but were up to the ankles in boggy ground. The morning had been very fine, but now the weather became cold and disagreeable; the blasts of wind were very piercing, and the snow fell thick; nevertheless they pursued their route in hope of finding a better road. Before they had got over this swamp, an accident happened that greatly disconcerted them: Mr. Buchan, one of the draughtsmen, whom Mr. Banks had taken with him, fell into a fit. It was absolutely necessary to stop and kindle a fire, and such as were most fatigued remained to assist him; but Mr. Banks, Dr. Solander, and Mr. Monkhouse proceeded, and attained the spot they had in view, where they found a great variety of plants that gratified their curiosity and repaid their toil. On returning to the company amidst the snow which now fell in great abundance, they found Mr. Buchan much recovered. They had previously sent Mr. Monkhouse

and Mr. Green back to him and those that remained with him, in order to bring them to a hill which was conjectured to lie in a better track for returning to the wood, and which was accordingly fixed on as a place of rendezvous. They resolved from this hill to pass through the swamp, which this way did not appear to be more than half a mile in extent, into the covert of the wood, in which they proposed building a hut, and kindling a fire, to defend themselves from the severity of the weather. Accordingly, the whole party met at the place appointed, about eight in the evening, whilst it was still day-light, and proceeded towards the next valley.

Dr. Solander, having often passed over mountains in cold countries, was sensible, that extreme cold when joined with fatigue, occasions a drowsiness that is not easily resisted; he therefore intreated his friends to keep in motion, however disagreeable it might be to them. His words were—Whoever sits down will sleep, and whoever sleeps will wake no more.—Every one seemed accordingly armed with resolution; but, on a sudden, the cold became so very intense as to threaten the most dreadful effects. It was now very remarkable, that the Doctor himself, who had so forcibly admonished and alarmed his party, was the first that insisted to be suffered to repose. In spite of the most earnest intreaties of his friends, he lay down amidst the snow, and it was with difficulty that they kept him awake. One of the black servants also became weak and faint, and was on the point of following this bad example. Mr. Buchan was therefore detached with a party to make a fire at the first commodious spot they could find. Mr. Banks and four more remained with the Doctor and Richmond the black, who with the utmost difficulty were persuaded to come on; and, when they had traversed the greatest part of the swamp, they expressed their inability of going any farther. When the black was told that if he remained there he would soon be frozen to death, his reply was, That he was so much exhausted with fatigue, that death would be a relief to him. Doctor Solander said he was not unwilling to go, but that he must first take some sleep, still persisting in acting contrary to the opinion which he himself had delivered to the company. Thus resolved, they both sat down, supported by some bushes, and in a short time fell asleep. Intelligence now came from the advanced party, that a fire was kindled about a quarter of a mile farther on the way. Mr. Banks then awakened the Doctor who had already almost lost the use of his limbs, though it was but a few minutes since he sat down; nevertheless, he consented to go on, but every measure taken to relieve the black proved ineffectual. He remained motionless, and they were obliged to leave him to the care of a sailor, and the other black servant, who appeared to be the least hurt by the cold, and they were to be relieved as soon as two others were sufficiently warmed to fill their places. The Doctor, with much difficulty, was got to the fire; and as to those who were sent to relieve the companions of Richmond, they returned without having been able to find them. What rendered the mortification still greater was, that a bottle of rum (the whole stock of the party) could not be found, and was judged to have been left with one of the three that were missing.

A fall of snow continuing for near two hours, there now remained no hopes of seeing the three absent persons again. At twelve o'clock, however, a great shouting was heard at a distance, which gave inexpressible satisfaction to every one present. Mr. Banks and four others went forward and met the sailor, who had just strength enough left to walk. He was immediately sent to the fire, and they proceeded to seek for the other two. They found Richmond upon his legs, but incapable of moving them; the other black was lying senseless upon the ground. All endeavours to bring them to the fire were fruitless; nor was it possible to kindle one upon the spot, on account of the snow that had fallen, and was falling, so that there remained no alternative, and they were compelled to leave the two unfortunate negroes to their fate, after they had made them

them a bed of the boughs of some trees, and covered them over thick with the same. As all hands had been employed in endeavouring to move these poor blacks to the fire, and had been exposed to the cold for near an hour and a half in the attempt, some of them began to be afflicted in the same manner as those whom they were to relieve. Briscoe, another servant of Mr. Banks, in particular, began to lose his sensibility. At last they reached the fire, and passed the night in a very disagreeable manner.

The party that set out from the ship had consisted of twelve; two of these were already judged to be dead, it was doubtful whether the third would be able to return on board, and Mr. Buchan, a fourth, seemed to be threatened with a return of his fits. The ship they reckoned to be at the distance of a long day's journey, through an unfrequented wood, in which they might probably be bewildered till night, and, having been equipped only for a journey of a few hours, they had not a sufficiency of provisions left to afford the company a single meal.

At day-break on the 17th nothing presented itself to the view all around but snow, which covered alike the trees and the ground; and the blasts of wind were so frequent and violent, that their journey seemed to be rendered impracticable, and they had reason to dread perishing with cold and famine. However, about six in the morning, they were flattered with a dawn of hope of being delivered, by discovering the sun through the clouds, which gradually diminished. Before their setting out, messengers were dispatched to the unhappy negroes; but these returned with the melancholy news of their death. Though the sky had flattered the hopes of the survivors, the snow continued falling very fast, a circumstance which impeded their journey, but a breeze springing up about eight o'clock, added to the influence of the sun, began to clear the air, and the snow falling in large flakes, from the trees, gave tokens of a thaw. Hunger prevailing over every other consideration, induced our travellers to divide the small remainder of their provisions, and to set forward on their journey about ten in the morning. To their great astonishment and satisfaction, in about three hours they found themselves on the shore, and much nearer to the ship than their most sanguine expectations could have suggested. When they looked back upon their former route from the sea, they found that instead of ascending the hill in a direct line, they had made a circle almost round the country. On their return, these wanderers received such congratulations from those on board, as can more easily be imagined than expressed.

Mr. Banks and Dr. Solander went on shore again on the 20th of this month, landing in the bottom of the bay, where they collected a number of shells and plants, hitherto unknown. After having returned to dinner, they went to visit an Indian town, about two miles up the country, the access to which, on account of the mud, was difficult. When they approached the town, two of the natives came out to meet them, who began to shout in their usual manner. They afterwards conducted Mr. Banks and the Doctor to their town. It was situate on a small hill, over-shaded with wood, and consisted of about a dozen huts, constructed without art or regularity. They were composed of a few poles, inclining to each other in the shape of a sugar-loaf, which were covered on the weather side with grass and boughs, and on the other side a space was left open, which served at once for a fire-place and a door. They were of the same nature of the huts that had been seen at St. Vincent's Bay. A little grass served for beds and chairs, and their utensils were a basket for the hand, a satchel to hang upon the back, and a bladder for water, out of which they drank through a hole near the top. This town was inhabited by a tribe of about fifty men, women and children. Their bows and arrows were constructed with neatness and ingenuity, being made of wood highly polished, and the point, which was either glass or flint, very skilfully fitted. These latter substances were observed among them unwrought,

as also cloth, rings, buttons, &c. from whence it was concluded that they sometimes travelled to the northward, as no ship, for years past, had touched at this part of Terra del Fuego. The natives here did not shew any surprise at the sight of fire-arms, but appeared to be well acquainted with their use. It is likely that the spot on which the Doctor and Mr. Banks met them, was not a fixed habitation, as their houses did not seem as if they were erected to stand for any long time, and they had no boats or canoes among them. They did not appear to have any form of government, or any ideas of subordination. They seemed to be the very outcasts of men; and a people that passed their lives in wandering in a forlorn manner over dreary wastes; their dwelling being a thatched hovel, and their cloathing scarcely sufficient to keep them from perishing with cold, even in those climates. Their only food was shell-fish, which on any one spot must soon be exhausted; nor had they the rudest implement of art, not even so much as was necessary to dress their food, yet amidst all this, we are told, that they appear to enjoy that content which is seldom found in great and populous cities; a species of content, which, if they really enjoyed it, must have arisen from stupidity, a satisfaction the offspring of the greatest ignorance. Such is the state of uncultivated nature; such the rude form which uncivilized man puts on. The wants of these people seemed to be few; but some wants all mankind must have, and even the most simple of them, these poor savages appeared scarcely in a condition to gratify. The calls of hunger and thirst must be obeyed, or man must perish, yet the people in question seemed to depend on chance for the means of answering them. Those who can be happy in such a situation, can only be so, because they have not a due feeling of their misery. We know that there have been admirers of simple nature amongst the philosophers of all ages and nations; and certainly simple nature has her beauties. In regard to the vegetative and brute creation, she operates with resistless energy; her power is prevalent as her pencil is inimitable; but when we ascend in the scale of beings, and come to examine the human race, what shall we find *them*, without cultivation? It is here that instinct ends and reason begins; and without entering into the question, Whether a state of nature is a state of war? when we observe the innumerable inconveniences to which those are subject on whom the light of science never dawned, we may easily determine in the favour of those arts which have civilized mankind, formed them into societies, refined their manners, and taught the nations where they have prevailed, to protect those rights which the untutored savages have ever been obliged to yield to the superior abilities of their better instructed invaders, and have thus fallen a prey to European tyranny.

We observed in this place seals, sea-lions, and dogs, and no other quadrupeds; nevertheless it is probable there are other kinds of animals in the country; for Mr. Banks remarked from a hill, an impression of the foot-steps of a large animal on the surface of a bog, but of what kind it was he could not determine. Not any land-birds were seen larger than an English black-bird, hawks and vultures excepted. Ducks and other water-fowls we saw in abundance; also shell-fish, clams, and limpets. The country, though uncleared, had neither gnat, musquito, nor any other noxious or troublesome animals. A great variety of plants were found by the Doctor and Mr. Banks. The wild celery and scurvy-grass are supposed to contain antiscorbutic qualities, which will therefore be of service to the crews of such ships as hereafter may touch at this place, after a long voyage. The latter is found in abundance near springs and in damp places, particularly at the watering place in the bay of Good Success, and it resembles the English cuckoo flower, or lady's-smock. The wild celery is like what grows in our gardens in England, but the leaves are of a deeper green. This plant may be found in plenty near the beach, and upon the land above the spring tides. In taste it is between that of celery and parsley. The grateful seaman, long confined

1111.

finer to salt provisions, enjoy this healing vegetable diet, as a special blessing of an all gracious Providence, particularly visible in providing in different climates different food and nourishment, suitable to his nature, wants and necessities.

On Sunday, Jan. 22, having got in our wood and water, we sailed out of the bay, and continued our course through the Streight; and in passing this, notwithstanding the description which some voyagers have given of Terra del Fuego, we did not find that it had, agreeable to their representations, such a forbidding aspect. On the contrary, we found the sea coasts and the sides of the hills clothed with verdure. Indeed the summits of the hills were barren, but the valleys appeared rich, and a brook was generally found at the foot of almost every hill; and though the water had a reddish tinge, yet it was far from being ill tasted. Upon the whole, it was the best we took on board during our voyage. Nine miles westward of cape St. Diego, the low point that forms the north entrance of the Streight of Le Maire, are three hills, called the Three Brothers; and on Terra del Fuego is another hill, in the form of a sugar-loaf, which stands on the west side not far from the sea. We had not that difficulty mentioned in the history of Lord Anson's voyage, in finding where the streight of Le Maire lies. No ship can well miss the streight that keeps Terra del Fuego in sight, for it will then be easily discovered; and Staten island which lies on the east side will be still more plainly perceived, for there is no land on Terra del Fuego like it. And let it be further particularly observed, that the entrance of the streight should be attempted only with a fair wind, when the weather too is moderate, and likewise, upon the beginning of the tide of flood, which here falls out upon the full and change of the moon, about one or two o'clock; let it also be remembered, to keep as near the shore of Terra del Fuego as the winds will permit.

The streight of Le Maire is bounded on the west by Terra del Fuego, and on the east by the west end of Staten island, and is nearly five leagues in length, nor less in breadth. The bay of Good Success is seated about the middle of it, on the side of Terra del Fuego, which presents itself at the entrance of the streight from the northward; and the south end of it may be distinguished by a land mark, resembling a road from the sea to the country. It affords good anchorage, and plenty of wood and water. Staten land did not appear to Captain Cook in the same manner as it did to Commodore Anson. That horror and wildness, mentioned by the Commodore, were not observed by our gentlemen; on the contrary the land appeared to be neither destitute of wood nor verdure, nor was it covered with snow; and on the north side we saw the appearances of bays and harbours. It is probable, that the season of the year and other circumstances might concur to occasion such different representations of a land, which all our circumnavigators must own to be unfriendly and disagreeably situated. On the west side of the cape of Good Success, whereby is formed the south west entrance of the streight, we saw the mouth of Valentine's bay; from whence the land lies in a direction west south-west for more than twenty leagues, appearing high and mountainous, with several inlets and bays. Fourteen leagues from the bay of Good Success, south-west half-west, and nearly three leagues from the shore, is New Island; terminating to the north-east in a remarkable hillock; and seven leagues from hence, south-west, lies Evout's isle; a little to the west of the south of which are two small low islands, near to each other, called Barnevelt's. These are partly surrounded with rocks, which rise to different heights above the water, and are twenty-four leagues from the streight of Le Maire. Three leagues south west by south, from Barnevelt's islands, is the south-east point of Hermit's islands, which lie south-east and north-west. They appeared to us, in different points of view, sometimes as one island, and at others as part of the main. From the south-east point of these islands to Cape Horn, the course is south-west by south, distant

No. 2.

three leagues. Hermit, who commanded the Dutch squadron in 1624, certainly put into some of them, and Chapenham, vice admiral of this squadron, first discovered that Cape Horn was formed by a cluster of islands. Between the streight Le Maire and Cape Horn we found, when near the shore, the current setting generally strong to the north-east; but we lost it at the distance of fifteen or twenty leagues from land.

January the 26th we took our departure from Cape Horn, and the farthest southern latitude we made was 60 deg. 10 min. and our longitude was then 74 deg. 30 min. west. Cape Horn is situated in 55 deg. 53 min. south latitude, and 68 deg. 13 min. west longitude. The weather being very calm, Mr. Banks failed in a small boat to shoot birds, when he killed some sheer-waters, and albatrosses. The latter were larger than those which had been taken to the northward of the streight, and proved to be very good food. At this time we found ourselves to be 12 deg. to the westward, and three and a half to the northward of the streight of Magellan, having, from the east entrance of the streight, been three and thirty days in sailing round Cape Horn. Notwithstanding the doubling of Cape Horn is represented as a very dangerous course, and that it is generally thought passing through the streight of Magellan is less perilous, yet the Endeavour doubled it with as little danger as she would the north Foreland on the Kentish coast; the heavens were serenely fair, the wind temperate, the weather pleasant, and, being near shore, we had a very distinct view of the coast. The Dolphin, in her last voyage, which was performed at the same season with ours, was not less than three months in passing through the streight of Magellan, not including the time that she lay in Port Famine; and it was the opinion of Captain Cook, that if we had come through the streight, we should not at this time have been in these seas; and should have suffered many inconveniences which we have not experienced. It is a question, Whether it is better to go through the streight of Le Maire, or to stand to the eastward, and go round Staten land? This can only be determined according to particular circumstances, which may make one or the other more eligible. The streight may be passed with safety by attending to the directions already given; but if the land is fallen in with to the eastward of the streight, and the wind should prove tempestuous, it would be best, in our opinion, to go round Staten land. In any case, however, we cannot approve of running into the latitude of 61 or 62, before any attempt is made to stand to the westward.

March the 1st we found ourselves, both by observation and the log, in latitude 38 deg. 44 min. south, and 110 deg. 33 min. west longitude, a concurrence very singular in a run of 660 leagues; and which proved, that no current had affected the ship in her course, and it was likewise concluded, that we had not come near land of any considerable extent; for currents are always found at no great distance from the shore. Mr. Banks killed above sixty birds in one day; also two forest flies, such as had never yet been described; he also found a cuttle-fish of a species different from those generally known in Europe. This fish had a double row of talons, resembling those of a cat, which it could put forth or withdraw at pleasure. When dressed it made excellent soup. On the 24th our latitude was 22 deg. 11 min. south, and 127 deg. 55 min. west longitude. On the 25th a young marine about twenty threw himself overboard, on account of a quarrel about a piece of seal skin, which he took by way of frolic; but being charged with it as a theft, he took the accusation so much to heart, that in the dusk of the evening he threw himself into the sea and was drowned.

On the 4th of April about 10 o'clock, A. M. Peter Briscoe, servant to Mr. Banks, discovered land to the south, at the distance of about three or four leagues. Capt. Cook immediately gave orders to haul for it, when we found an island of an oval form, having a lagoon or lake in the center, that extended over the

D

greater

greater part of it. The surrounding border of land was low and narrow in many places, especially towards the south, where the beach consisted of a reef of rocks. Three places on the north side had the same appearance, so that on the whole the land seemed to resemble several woody islands. To the west was a large clump of trees, and in the center two cocoa-nut trees. When within a mile of the north side, though we cast out a line, no bottom could be found at 130 fathom, nor any good anchorage. This island was covered with trees, but we could discern no other species than the palm and the cocoa-nut. Several of the natives were discovered on shore, they appeared to be tall, with heads remarkable large, which probably some bandage might have increased. Their complexion was of the copper colour, and their hair was black. Some of these people were seen abreast of the ship, holding poles or pikes of twice their own height. They appeared also naked, but when they retired, on the ship's passing by the islands, they put on a light-coloured covering. Some clumps of palm-trees served them for habitations, which at a distance appeared like hilly ground, and the view of the groves was a very agreeable one. Our captain called this place Lagoon Island. It lay in 18 degrees south latitude, and 139 west longitude. In the afternoon we again saw land to the north-west, by sun-set we reached it, when it appeared to be a low island of a circular form, and about a mile in circumference. The land was covered with verdure of various kinds, but no inhabitants were visible, nor any cocoa-nut trees. This island is distant from that of Lagoon about seven leagues north, and 62 west, which our gentlemen on board named Thumb Cap.

On the 5th we continued our course with a favourable wind, and about three o'clock discovered land to the westward. It was low, in form resembling a bow, and in circumference seemed to be ten or twelve leagues. Its length is about three or four leagues, and its width about two hundred yards. The beach was flat, and seemed to have no other herbage upon it than seaweeds. The resemblance of a bow was preserved in the arch and cord forming the land, while the intermediate space was taken up by water. The arch, in general, was covered with trees of various verdure and different heights. This island, from the smoke that was discovered, appeared to be inhabited, and we gave it the name of Bow Island.

On the 6th about noon, we again saw land to the west, and at three o'clock we came up with it. This land seemed to be divided into two parts, or rather a collection of islands, (to which we gave the name of the Groups) to the extent of about nine leagues. The two largest were divided from the others by a freight, the

breadth of which was about half a mile. Some of these islands were ten miles or more in length, but appeared like long narrow strings of land, not above a quarter of a mile in breadth; but they produced trees, however, of different kinds, among which was the cocoa-nut tree. Several of the inhabitants came out in their canoes, and two of them shewed an intention of coming on board; but these, like the rest, stopped at the reef. From the observations made, these people appeared to be about our size, and well made. Their complexion was brown, and they were naked. In general, they had two weapons, one was a long pole, spear-pointed, and the other resembled a paddle. Several of their canoes were constructed in such a manner as not to carry more than three persons; others were fitted up for six or seven; and one of these boats hoisted a sail, which was converted into an awning when a shower of rain fell. Capt. Cook would not stay for any of them, neither could we determine, whether the signals made were meant for defiance, or for invitation; one party waving their hats, and another answering by shouting. In this respect it was not judged prudent to try the experiment, in order to be convinced, as the island appeared of no importance, and the crew not being in want of any thing it could produce. This curiosity was therefore laid aside, in expectation of soon discovering the island, where we had been directed to make our astronomical observations, the natives of which, it was reasonable to conjecture, would make no resistance, having already experienced the danger of opposing an European force.

On the 7th we discovered another island, judged to be in compass about five miles, being very low, and having a piece of water in the center. It appeared to abound in wood, and to be covered with verdure, but we saw no inhabitants upon it. It was named Bird Island, from the number of birds that were seen flying about. This lies in latitude 17 deg. 48 min. south, and 143 deg. 35 min. west longitude; distant ten leagues, in the direction west, half north from the west end of the Groups.

On the 8th in the afternoon we saw land to the northward, and came abreast of it in the evening, at about five miles distance. This land seemed to be a chain of low islands, of an oval figure, and consisted of coral and sand, with a few clumps of small trees, and in the middle of it was a lagoon. On account of its appearance, it was called Chain Island.

On the 10th, after a tempestuous night we came in sight of Osnaburgh island, called by the natives Maitea. This island is circular, about four miles in circumference, partly rocky, and partly covered with trees.

C H A P. III.

The Endeavour arrives at Otaheite, or George the Third's Island—Rules established by Capt. Cook for conducting a trade with the natives—An account of several incidents during his stay in this island—An observatory and fort erected—Excursions into the woods—Visits from several of the chiefs—The music of the natives, and their manner of burying their dead, described—Other excursions and incidents, both on board and on shore—First interview with Obeera, the supposed Queen of the island—The fort described—The quadrant stolen, and the consequences—A visit to Tootabab, an Indian chief—A wrestling-match described—European seeds are sown—The Indians give our people names.

ON the 11th we made Otaheite, or as captain Wallis had named it, king George the Third's Island. The calms prevented our approaching it till the morning of the 12th, when a breeze sprung up, and several canoes were seen making towards the ship. Few of them, however, would come near, and those who did could not be persuaded to come on board. They had brought with them young plantains and branches of trees, which were handed up the ship's side, and, by their desire, were stuck in conspicuous parts of the rigging as tokens of peace and friendship. We then purchased their commodities, consisting of cocoa-nuts, bananas, bread-fruit, apples and figs, which

were very acceptable to the crew. On the evening of the same day we opened the north-west point of the isle, to which the Dolphin's people had given the name of York Island. We lay off and on all night, and in the morning of the 13th we entered Port Royal Harbour in the island of Otaheite, and anchored within half a mile of the shore. Many of the natives came off immediately in their canoes, and brought with them bread-fruit, cocoa-nuts, apples, and some hogs, which they bartered for beads and other trinkets with the ship's company. The tree which bears the bread-fruit is about the size of a horse-chestnut: its leaves are near a foot and a half in length, in shape oblong, and very much

visiting Capt. Cook in his second Voyage to the Southern Hemisphere.

much resemble those of the fig-tree. The fruit is not unlike the cantaloupe melon: it is inclosed in a thin skin, and its core is as large as a man's thumb. The substance of this fruit is somewhat like that of new bread, and as white as the blanched almond. It must be roasted, and when eaten it has the taste of a slight sweetness.

Among those who came on board the *Endeavour*, was an elderly man, named Owhaw, known to Mr. Gore and others who had visited this island with captain Wallis. Owhaw being considered by our gentlemen as a very useful man, they studied to please him, and to gratify all his wishes. As our continuance in George's Island was not likely to be very short, certain rules were drawn up to be observed by every person on board his majesty's bark the *Endeavour*, for the better establishing a regular trade with the natives. The substance of these rules were, "That in order to prevent quarrels and confusion, every one of the ship's crew should endeavour to treat the inhabitants of Otaheite with humanity, and by all fair means to cultivate a friendship with them. That no officer, seaman, or other person, belonging to the ship, excepting such only who were appointed to barter with the natives, should trade, or offer to trade, for any kinds of provision, fruit, or other produce of the island, without having express leave so to do. That no person should embezzle, trade, or offer to trade with any part of the ship's stores: and, that no sort of iron, or any thing made of iron, nor any sort of cloth, or other useful articles in the ship, should be given in exchange for any thing but provision." These necessary rules were signed by Capt. Cook, and, being his orders, to the non-observance of them were annexed certain penalties, besides the punishment according to the usual custom of the navy.

When the bark was properly secured, Capt. Cook, Mr. Banks, and Dr. Solander, went on shore, with a party under arms, and their friend the old Indian. They were received by some hundreds of the natives with awe and reverence, who exchanged the tokens of peace, and offered to conduct them to a spot of ground, which would be more convenient for them to occupy, than that where they had landed. On their way, the English made the Indians some presents, which the latter very thankfully received. They now took a circuit of about four miles through groves of the bread-fruit and cocoa-trees. Intermingled with these were the dwellings of the natives, which consisted of huts without walls. In the course of their journey they found but few fowls or hogs, and understood, that none of their conductors, nor any of the people they had hitherto seen, were persons of rank in the island. Those of our crew, who had before been at Otaheite in the *Dolphin*, were likewise of opinion, that the queen's residence had been removed, as no traces of it were now to be discovered.

Next day, in the morning, before they could leave the ship, several canoes came about her filled with people, whose dress denoted them to be of the superior class. Two of these came on board, and each of them fixed upon a friend: one of them chose Mr. Banks, and the other Captain Cook. The ceremonials consisted of taking off their cloaths in great part, and putting them upon their adopted friends. This compliment was returned by our gentlemen presenting them with some trinkets. They then made signs for their new friends to go with them to the place of their abode; and the latter being desirous of being acquainted with the people, and finding out a more convenient harbour, accepted the invitation, and went with them, accompanied by Mr. Banks, Dr. Solander, Captain Cook, and others. We all landed in two boats at the distance of about three miles, among a great number of the natives, who conducted us to a large habitation, where we were introduced to a middle-aged man, named Tootahah. When we were seated, he presented to Mr. Banks a cock, a hen, and a piece of perfumed cloth, which compliment was returned by a present

from Mr. Banks. We were then conducted to several other large dwellings, wherein we walked about with great freedom. The ladies so far from shunning, invited, and even pressed us to be seated. By frequently pointing to the mats upon the ground, and sometimes drawing us down upon them, we had no doubt of their being less jealous of observation than we were; but the huts that are all open, except a roof, afforded no place of requisite retirement. Walking afterwards along the shore, we met, accompanied by a great number of natives, another chief named Toubourai Tamaide, with whom we settled a treaty of peace, in the manner before described. This chief gave us to understand, that he had provisions at our service, if we chose to eat, which he produced, and we dined heartily upon bread-fruit, plantains, and fish. During this visit, Tomio, the chief's wife, placed herself upon the same mat with Mr. Banks close by him; but as she was not young, nor appeared ever to have possessed many charms, this gentleman paid little attention to her; and Tomio received an additional mortification, when Mr. Banks beckoned to a pretty girl, who, with some reluctance, came and placed herself by him. The princess was somewhat chagrined at this preference given to her rival; nevertheless she continued her assiduities to her guest. This whimsical scene was interrupted by an event of a more serious nature; Dr. Solander having missed his opera glass, a complaint was made to the chief, which interrupted the convivial party. The complaint was enforced by Mr. Banks's starting up and striking the butt-end of his musquet against the ground, which struck the Indians with such a panic that all of them ran precipitately out of the house, except the chief and a few others of the superior class. That no disadvantageous notions might be entertained of them on account of this circumstance, the chief observed, with an air of great probity, That the place which the Doctor had mentioned on this occasion, was not within his district, but that he would send to the chief of it, and endeavour to recover it, adding, that if this could not be done, he would make the Doctor compensation, by giving him as much new cloth (of which he produced large quantities) as should be thought equal to the value. The case however was brought in a little time, and the glass itself soon after, which deprived us of the merit we should otherwise have had in refusing the cloth which had been offered us. But it afforded an opportunity of convincing the natives of our generosity, by lavishing rewards upon them for an action, to which self-interest had been the motive, rather than any sentiment of probity; to which, from numerous transactions, they appeared to be absolutely strangers. After this adventure was amicably terminated, we returned to the ship about six o'clock in the evening. On Saturday the 15th, in the morning, several of the chiefs, one of whom was very corpulent, came on board from the other point, bringing with them hogs, bread-fruit, and other refreshments, in exchange for which they received linen, beads, and other trinkets; but some of them took the liberty of stealing the lightening chain. This day the captain, attended by Mr. Banks, and some of the other gentlemen, went on shore to fix on a proper spot to erect a fort for their defence, during their stay on the island, and the ground was accordingly marked out for that purpose; a great number of the natives looking on all the while, and behaving in the most peaceable and friendly manner.

Mr. Banks and his friends having seen few hogs and poultry in their walks, they suspected that they had been driven up the country; for which reason they determined to penetrate into the woods, the tent being guarded by a petty officer and a party of marines. On this excursion several of the natives accompanied the English. While the party were on their march they were alarmed by the discharge of two pieces fired by the guard of the tent. Owhaw having now called together the captain's party, dispersed all the Indians, except three, who in token of their fidelity broke branches

branches of trees, according to their custom, and whom it was thought proper to retain. When they returned to the tent, they found that an Indian having snatched away one of the centinel's musquets, a young midshipman, who commanded the party, was so imprudent as to give the marines orders to fire, which were obeyed, and many of the natives were wounded; but this did not satisfy them, as the offender had not fallen, they therefore pursued him and revenged the theft by his death. This action, which was equally inconsistent with policy and humanity, could not but be very displeasing to Mr. Banks; but as what had passed could not be recalled, nothing remained but to endeavour to accommodate matters with the Indians. Accordingly he crossed the river where he met an old man, through whose mediation several of the natives were prevailed to come over to them, and to give the usual tokens of friendship. The next morning, however, they saw but few of the natives on the banks, and none came on board, from whence it was concluded that the treatment they had received the former day was not yet forgotten, and the English were confirmed in this opinion by Owhaw's having left them. In consequence of these circumstances, the captain brought the ship nearer to the shore, and moored her in such a manner as to make her broad-side bear on the spot which they had marked out for erecting their little fortification. But in the evening the captain and some of the gentlemen going on shore, the Indians came round them, and trafficked with them as usual.

Mr. Banks on the 17th, had the misfortune to lose Mr. Buchan. The same day they received a visit from Tubourai Tumaida, and Tootahah. They brought with them some plantain branches, and till these were received, they would not venture on board. They bartered some bread-fruit and a hog which was ready dressed, for nails, with the English.

The fort began to be erected on the 18th. And now some of the company were employed in throwing up intrenchments, whilst others were busied in cutting fascines and pickets, in which work the Indians assisted them. They fortified three sides of the place, with intrenchments, and pallisades, and upon the other which was flanked by a river, where a breast-work was formed by the water-casks. The natives brought down such quantities of bread fruit and cocoa-nuts this day, that it was necessary to refuse them, and to let them know that none would be wanting for two days. Mr. Banks slept for the first time on shore this night. None of the Indians attempted to approach his tent, he had however taken the precaution of placing centinels about it, for its defence, in case any attack should be meditated.

Tubourai Tumaida visited Mr. Banks at his tent on Wednesday the 19th, and brought with him his wife and family with the materials for erecting a house intending to build it near the fort. He afterwards asked that gentleman to accompany him to the woods. On their arrival at a place where he sometimes resided, he presented his guests with two garments, one of which was of red cloth, and the other was made of fine matting; having thus clothed Mr. Banks, he conducted him to the ship, and staid to dinner with his wife and son. They had a dish served up that day, which was prepared by the attendants of Tubourai Tumaida, which seemed like wheat flour, and being mixed with cocoa-nut liquor, it was stirred about till it became a jelly. Its flavour was something like blanc mange. A sort of market was now established without the lines of the fort, which was tolerably well supplied, and Tubourai Tumaida was a frequent guest to Mr. Banks, and the other English gentlemen. He was the only native that attempted to use a knife and fork, being fond of adopting European manners. Mr. Monkhouse the surgeon being abroad on his evening walk, reported that he had seen the body of a man who had been shot from the tent, of which he gave the following account.—“The corpse was deposited in a shed, close to the house where the deceased had resided when he was alive, and others were within ten yards of it. It was about fifteen feet in length, and eleven in breadth, and

the height was proportionable. The sides and one end were inclosed with a sort of wicker work; the other end was intirely open. The body lay on a bier, the frame of which was of wood, supported by posts about five feet high, and was covered with a mat, over which lay a white cloth: by the side of it lay a wooden mace, and towards the head two cocoa shells; towards the feet was a bunch of green leaves, and small dried boughs tied together, and stuck in the ground, near which was a stone about the size of a cocoa-nut; here were also placed a young plantain tree, and a stone axe. A great many palm nuts were hung in strings at the open end of the shed; and the stem of a palm-tree was stuck up on the outside of it, upon which was placed a cocoa-shell filled with water. At the side of one of the posts there hung a little bag with some roasted pieces of bread-fruit.” The natives were not pleased at his approaching the body, their jealousy appearing plainly in their countenances and gestures.

On the 22d we were entertained by some of the musicians of the country, who performed on an instrument somewhat resembling a german flute, but the performer blew through his nostril instead of his mouth, and others accompanied this instrument, singing only one tune. Some of the Indians brought their axes to grind and repair, most of which they had obtained from Captain Wallis and his people in the Dolphin; but a French one occasioned a little speculation, and at length upon enquiry, it appeared to have been left here by M. de Bougainville.

On the 24th Mr. Banks and Dr. Solander made an excursion into the country, and found it level and fertile along the shore, for about two miles to the eastward; after which the hills reached quite to the water's edge; and farther on they ran out into the sea. Having passed these hills, which continued about three miles, we came to an extensive plain, abounding with good habitations, and the people seemed to enjoy a considerable share of property. The place was rendered still more agreeable by a wide river issuing from a valley, and which watered it. We crossed this river, when perceiving the country to be barren, we resolved to return. Just as we were about so to do, we were offered some refreshment by a man, which some writers have expressed to be a mixture of many nations, but different from all, his skin being of a dead white, though some parts of his body were not so white as others; and his hair, eye-brows and beard were as white as his skin. His eyes appeared like those that are blood-shot, and he seemed as if he was near-sighted. Upon our return, the excessive joy of Tubourai Tamaide and his women is not to be expressed.

On the 25th, in the evening, several of the gentlemen's knives being missing, Mr. Banks, who had lost his among the rest, accused Tubourai Tamaide of having taken it, which as he was innocent, occasioned him a great deal of unmerited anxiety. He made signs, while the tears started from his eyes, that if he had ever been guilty of such a theft as was imputed to him, he would suffer his throat to be cut. But though he was innocent, it was plain from many instances, that the natives of this island were very much addicted to thieving: though Mr. Banks's servant had mislaid the knife in question, yet the rest were produced in a rag, by one of the natives.

When the guns on the 26th, which were six swivels, had been mounted on the fort, the Indians seemed to be in great trouble, and several of the fishermen removed, fearing, notwithstanding all the marks of friendship that had been shewn to them by our people, they should, within a few days, be fired at from the fort: yet the next day, being the 27th, Tubourai Tamaide came with three women, and a friend of his, who was a remarkable glutton, into the fort to dine with us, and after dinner returned to his own house in the wood. In a short time after he came back to complain to Mr. Banks, of a butcher, who had threatened to cut his wife's throat, because she would not barter a stone hatchet for a nail. It appearing clearly that the offender

A TOUPAPOW, with a CORPSE on it—attended by the Chief Mourner in his Habit of Ceremony.

VIEW OF THE HOUSE OF THE GOVERNOR, ST. JOHN, N. H.

der had infringed one of the rules enjoined by the Captain for trading with the natives, he was flogged on board in their sight. When the first stroke had been given they were humane enough to interfere, and intreated earnestly that the culprit might be untied; but when this favour was denied them, they shewed strong signs of concern, and burst into tears.

On the 28th, Terapo, one of Tabourai Tamaide's female attendants, came down to the fort in the greatest affliction, the tears gushing from her eyes. Mr. Banks seeing her full of lamentation and sorrow, insisted upon knowing the cause, but instead of answering, she struck herself several times with a shark's tooth upon her head, till an effusion of blood followed, while her distress was disregarded by several other Indians, who continued laughing and talking with the utmost unconcern. After this, she gathered up some pieces of cloth, which she had thrown down to catch the blood, and threw them into the sea, as if she wished to prevent the least trace and mark of her absurd behaviour. She then bathed in the river, and with remarkable cheerfulness returned to the tent, as if nothing extraordinary had happened. During the forenoon of this day the Indian canoes were continually coming in, and people of both sexes filled the tents of the fort. Mr. Molineux, master of the Endeavour, seeing a woman whose name was Oberea, he declared she was the same person, whom he judged to be the queen of the island when he was there with Captain Wallis. The eyes of every one were now fixed on her, of whom so much had been said by the crew of the Dolphin, and in the account given of her by the captain. With regard to her person, she was tall and rather large made; she was about forty years of age, her skin white, and her eyes had great expression in them: she had been handsome, but her beauty was now upon the decline. It was not long before an offer was made to conduct her on board the ship, which she accepted. Many presents were made her, particularly a child's doll, which she viewed very attentively. Captain Cook accompanied her on shore, and when we landed, she presented him with a hog and some plantains, in return for his presents, which were carried to the fort in procession, Oberea and the Captain bringing up the rear. In the way they met Tootahah, who, though not king, seemed to be at this time invested with sovereign authority. Envy is found among those who are supposed to be the children of simple nature. Her influence was plainly visible in a matter which to us was rather a subject of laughter than of serious consideration. Tootahah no sooner saw the doll, than he discovered strong symptoms of jealousy, nor could any method be found of conciliating his friendship, but that of complimenting him with a baby also. A doll was now preferable to a hatchet; but a very short time taught the Indians the superior value of iron, which, on account of its usefulness, prevailed over every other consideration. To such of the men who came from time to time on board, the ship's provisions seemed to be very acceptable, but the women did not chuse to taste them; and though they were courted to dine with our gentlemen, yet, for reasons known only to themselves, they preferred the eating of plantains with the servants.

On the 29th, near noon, Mr. Banks paid a visit to Oberea, but was informed that she was asleep under the awning of her canoe; and, going to call her up, was surprized at finding her in bed with a young fellow of about twenty-five years of age, a discovery which caused him to retire rather disconcerted; but he soon understood that a commerce of this kind was by no means considered as scandalous, the ladies frequently courting the men to amorous dalliance, of which they made no secret; and as to young Obadee, found in bed with the queen, he was well known by every one to be the object of her lascivious hours. The queen soon got up, and dressed herself to wait upon Mr. Banks, and, after having, as a token of her particular regard, put on him a suit of fine cloth, they proceeded together to the tents. In the evening Mr. Banks visited Tubourai Tamaide. He was astonished

No. 2.

to find this chief and his family in tears, and not being able to discover the cause, he soon took leave of them. Upon his return the officers told him, that Owahaw had foretold, that the guns would be fired within four days, and as this was the eve of the third day, they were alarmed at the situation they judged themselves to be in. As we were apprehensive of ill consequences from this prepossession, the centinels were doubled at the fort, and we thought it necessary to keep under arms; but Mr. Banks walking round the point, at two in the morning, and finding nothing that might tend to encourage his suspicions, he dropped them, and rested secure in the fort. This our little fortification was now complete. A bank of earth four feet and an half high on the inside, and a ditch without ten feet broad and six deep, formed the north and south sides. On the west, opposite the bay, was another bank (with pallisades upon it) four feet high; but a ditch was unnecessary, the works being at high-water mark. Upon the river's bank, on the east side, was a range of water casks, filled with water. This being thought the weakest side, we planted two four pounders, and mounted six swivel guns, which commanded the only two avenues from the woods. We had about forty-five men in this fort, including the officers, and other gentlemen who resided on shore.

On the 30th Tomio came in great haste to our tents, and taking Mr. Banks by the arm, told him that Tubourai Tamaide was dying, owing to somewhat that had been given him by our people, and intreated him instantly to go to him. Accordingly Mr. Banks went, and found the Indian very sick. He had been vomiting, and had thrown up a leaf which they said contained some of the poison. Mr. Banks having examined the leaf, found it was nothing but tobacco, which the Indian had begged of some of the ship's company.

The matter, however, appeared in a very serious light to Tubourai Tamaide, who really concluded from the violent sickness he suffered, that he had swallowed some deadly drug, the terror of which no doubt contributed to make him yet more sick. While Mr. Banks was examining the leaf, he looked up to him, as if he had been just on the point of death. But when the nature of this dreadful poison was found out, he only ordered him to drink of cocoa-nut milk, which soon restored him to health, and he was as cheerful as before the accident happened. These people seemed in particular instances to be sometimes strangely afflicted from slight causes.

On the 1st of May, Captain Cook having produced an iron adze, which was made in imitation of the stone ones used by the natives, shewed it to Tootahah, as a curiosity. The latter snatched it up and insisted on having it; and though he was offered the choice of any of the articles in the chests which were opened before him, yet he would not accept of any thing in its stead. A chief dined with us that day, who had been on board some time before, accompanied by some of his women that used to feed him. He now came alone; and when all things were set ready for dinner, the captain helped him to some victuals, supposing that he would have dispensed with the ceremony of being fed; but he was deceived; for the chief never attempted to eat, and would have gone without his dinner, if one of the servants had not fed him. The next morning, May 2, we took the astronomical quadrant and some of the instruments on shore that afternoon; and to our great surprise when we wanted to make use of the quadrant, the next day, it was not to be found; a matter which was looked upon as the more extraordinary, as a centinel had been placed for the whole night within a few yards of the place where it was deposited. Our own people, at first, were suspected of being concerned in this theft, and, as the instrument had never been taken out of the case, it was suspected that some person might have carried it off, under the supposition that its contents were articles used in traffic. A strict search was made in and about the fort, and a considerable reward offered in order to

E

obtain

obtain it again. But all this proving fruitless, Mr. Banks, accompanied by Mr. Green and some other gentlemen, set out for the woods, where they thought they might probably get some tidings of what was stolen. In their way, they met with Tubourai Tamaide and some of the natives. This chief was made to understand by signs, that they had lost the quadrant, and that as some of his countrymen must have taken it, they insisted upon being shewn the place where it was concealed. Having proceeded a few miles together, after some enquiry, Tubourai Tamaide was informed who the thief was, and it was found that he was then at a place about four miles distant. As they had no arms but a brace of pistols, not caring to trust themselves so far from the fort, a message was dispatched to Capt. Cook, requesting him to send out a party to support them. The captain accordingly set out with a party properly armed, after having laid an embargo upon all the canoes in the bay.

In the mean time, Mr. Banks and Mr. Green proceeded on their way, and at the place which had been mentioned, were met by one of Tubourai Tamaide's own people, bringing with him part of the quadrant; the case and the other parts of the instrument were recovered soon afterwards, when it was found that it had received no real injury, though it had been taken to pieces.

When they returned in the evening, they were much surprised to find Tootahah under confinement in the fort, while a crowd of the natives surrounded the gate, discovering marks of the greatest anxiety for the fate of their chief. The occasion of his detention originated from the conduct of the Indians: alarmed at Capt. Cook's having gone up the country with an armed party, most of the natives left the fort that evening, and one of the canoes attempted to quit the bay. The lieutenant who commanded on board the ship, having it in charge not to suffer any canoe to depart, sent a boat to detain her, but she no sooner approached, than the Indians jumped into the sea. Tootahah being of the number, was taken up, and sent by the lieutenant to the officer that commanded at the fort, who concluded he should do right to detain him prisoner, while the poor chief thought of nothing but being put to death, till Capt. Cook caused him to be returned, to the great joy of his countrymen. But the natives were still inclined to bear this affair in their minds, and as a proof of it, they neglected to supply the market with provisions. Mr. Banks walking into the woods, heard great murmurings concerning the treatment of Tootahah, who, as they said, had been ill used and beaten, though Mr. Banks declared he was quite ignorant of his having received such treatment.

The chief now sent for such hogs to be restored as he had left behind him, at first intending them as a present, which by this time, perhaps, he did not think the English had merited; but they refused to send them unless he would come himself, thinking by an interview to promote a reconciliation; and this they were the more desirous of, as they were told it would be a fortnight before he would pay them a visit.

On the 3d provisions were extremely scarce, as the markets continued to be ill supplied on the account already mentioned; and it was not without some difficulty, that Mr. Banks got a few baskets of bread-fruit from Tubourai Tamaide. Tootahah on the 4th sent for an axe and a shirt in return for the hogs, which were accordingly promised to be brought him the next day. He sent again early in the morning of the 5th, and Mr. Banks and the Doctor set out in the pinnace, taking with them one of Tootahah's people and soon reached Eparre, where he resided, which was a few miles to the westward. When they arrived there, they found a great number of the natives waiting for them on the shore, and were conducted directly to the chief, the people notwithstanding the offence they had so lately taken, shouting out in their language, "Tootahah is your friend." He was sitting under a tree, and some old men were standing about him. Having made signs for them to be seated, he asked for the axe,

which was then given him by Capt. Cook, as also the shirt that he had demanded, and a broad-cloth garment, which latter he put on, and was well pleased with the present. They ate a mouthful together in the boat, and were afterwards conducted to a large court-yard on one side of the chief's house, where they were to be entertained with wrestling after the manner of the country. He himself sat at the upper end of the area, having several of his principal men on each side of him, who appeared as judges of the sport, which was as follows:

"Ten or twelve combatants entered the area, and after many simple ceremonies of challenging, they engaged, and each endeavoured to throw his antagonist by mere strength: thus they seized each other by the hand, or other parts of the body, grappling, without the least art, till one, by having a greater hold, or stronger muscular force, threw his antagonist on his back. The conquest was applauded by the old men with a few words repeated in a kind of tune, and with three huzzas. After one engagement another succeeded; but if the combatants could not throw each other in the space of a minute, they parted, either by consent, or the intervention of their friends. Several women of rank in the country were present, but it was thought they only attended this amusement in compliment to the English gentlemen. A man with a stick, who made way for us when we landed, officiated as master of the ceremonies, keeping order among the people, and those of them who pressed forward he struck with his stick very smartly. During these athletic sports, another party of men performed a dance, for the space of a minute, but neither of these parties took the least notice of each other, their attention being wholly fixed on their own endeavours to please and conquer. At the conclusion of this entertainment, not unlike the wrestling-matches of remote antiquity, we were told, that some hogs, and a large quantity of bread fruit were preparing for our dinner, very agreeable intelligence to those whose appetites were sharpened by their journey; but our host, instead of setting his two hogs before us, ordered one of them to be carried into our boat. Here we thought to have enjoyed our good cheer, and yet we neither dined on shore, nor in the boat, but at the desire of Tubourai Tamaide, proceeded as far as the ship: no small mortification this, as we had to row four miles, while our dinner was growing cold: however, we were at last gratified with our promised repast, of which our chief and his friends had a liberal share. This friendly reconciliation between them and us, operated on the natives like a charm: for it was no sooner known that Tubourai Tamaide was on board, than provisions of all kinds were brought to the fort in great plenty.

On the 8th, early in the morning, Mr. Molineux, the Master, and Mr. Green set out in the pinnace to the eastward, in order to procure some poultry, or hogs. They saw many of the latter, and one turtle, yet could not purchase either, because they belonged to Tootahah, and without his permission, the people could not be prevailed upon to sell them. Hence we concluded that Tootahah was indeed a prince; and we afterwards learnt, that, in this part of the island, he acted as regent for a minor, whom we never saw all the time of our stay here. However, some time afterwards, having produced some nails to barter for provisions, we obtained near twenty cocoa-nuts, and some bread-fruit, for one of the smallest size, so that we soon had plenty of these articles, though no hogs. In this excursion Mr. Green imagined he had discovered a tree sixty yards in circumference; but, on his return, he was informed by our two gentlemen, that it was a species of the fig, whose branches bending down to the earth take fresh root, and thus form a mass of trunks, which being all united by a common vegetation, might easily be mistaken for one trunk or body.

On the 9th in the forenoon, Oberca paid us a visit, accompanied by her favourite Obadee, presenting us with a hog and some bread-fruit. This was the first visit we had received from this lady, since the loss of

our quadrant, and the confinement of Tootahah. By this time our forge was set up and at work, which afforded a new subject of admiration to the Indians, and to Capt. Cook an additional opportunity of conferring obligations on them, by permitting the smith, in his leisure hours, to convert the old iron, which they were supposed to have procured from the Dolphin, into different kinds of tools. Oberea produced as much old iron as would have made for her another axe; this she requested to have done; however the lady could not be gratified in this particular, upon which she brought a broken axe, desiring it might be mended. The axe was mended, and to all appearance she was content. On their return home, the Indians took with them the canoe which had lain some time at the point.

On the 10th we sowed, in ground properly prepared, seeds of melons and other plants, but none of them came up, except mustard. Mr. Banks thought the seeds were spoiled by a total exclusion of fresh air, they

having all been put into small bottles, and sealed up with rosin. We learnt this day, that the Indians called the island Otaheite, the name by which we have distinguished it; but we were not so fortunate in our endeavours to teach them our names; and, after repeated attempts to pronounce them, which proved fruitless, they had recourse to new ones, the productions of their own invention. Capt. Cook they named Toote; Mr. Hicks, Hete. The master they called Boba, from his christian name Robert; Mr. Gore, Toarro; Dr. Solander, Torano; Mr. Banks, Tapane; Mr. Green, Eteree; Mr. Parkinson, Patani; Mr. Sporing, Polini; and so on for the greatest part, of the ship's crew. These perhaps, were significant words in their own language; and we are inclined to this opinion, because Mr. Monkhouse, who commanded the party, that shot the man for stealing a musket, they named Matte, which was not merely an arbitrary sound, but in their language it signified dead.

C H A P. IV.

An extraordinary visit—Divine service attended by the natives of Otaheite—An uncommon sight—Tubourai Tamaide found guilty of theft—A visit paid to Tootahah—Various adventures at that time, and an extraordinary amusement of the Indians—A relation of what happened at the fort, while preparations were making to observe the Transit of Venus—The observations made with great success—A particular account and description of an Indian funeral—An unusual character among the Indians—A robbery at the fort—Specimen of Indian cookery—A narrative of various incidents—A circumnavigation of the island, and occurrences during this expedition—A burying-place, and a Merai, or place of worship described—An inland expedition of Mr. Banks—Preparations made by the crew of the Endeavour to leave the island of Otaheite—An account of the departure of the Endeavour, and the behaviour of the natives, particularly of Tupid, on this occasion.

ON the 12th of this month (May) an uncommon ceremony was performed by some of the natives. As Mr. Banks was sitting in his boat, trading with them as usual, some ladies, who were strangers, advanced in procession towards him. The rest of the Indians on each side gave way and formed a lane for the visitors to pass, who coming up to Mr. Banks, presented him with some parrots feathers, and various kinds of plants. Tupid, who stood by Mr. Banks, acted as his master of the ceremonies, and receiving the branches, which were brought at six different times, laid them down in the boat. After this some large bundles of cloth were brought, consisting of nine pieces, which being divided into three parcels, one of the women, called Oorattooa, who appeared to be the principal, stepping upon one of them, pulled up her cloaths as high as her waist, and then, with an air of unaffected simplicity, turned round three times. This ceremony she repeated, with similar circumstances, on the other two parcels of cloth; and the whole being then presented to Mr. Banks, the ladies went and saluted him; in return for which extraordinary favours, he made them such presents as he thought would best please them. In the evening the gentlemen of the fort were visited by Oberea, and Otheorea, her favourite female attendant, who was a very agreeable girl, and whom we were the more pleased to see, because it had been reported that she was either sick or dead.

On the 13th Tubourai Tamaide offended Mr. Banks, by snatching his gun out of his hand, and firing it in the air; an action which also much surprized that gentleman, as he imagined him totally ignorant of the use of it. And as the ignorance of the people of those countries in regard to this particular, must always cause them to fear their guests, Mr. Banks therefore made a serious matter of what, probably, the other meant only as a joke, and, not without threats, gave him to understand, that for him but to touch the piece was a high insult. The offender made no reply, but set out immediately, with his family, for Eparre. Great inconvenience being apprehended from this man, and as in many instances he had been particularly useful, Mr. Banks determined to follow him. He set out the same evening from the fort, accompanied by Mr. Molineux, and found him in the middle of a large circle of people,

the picture of extreme grief, which was also visible in the countenances of his attendants. One of the women expressed her trouble in the same manner as Terapo had done, upon another occasion. Mr. Banks lost no time in endeavouring to put an end to all animosity. The chief was soothed into confidence, and, a double canoe being got ready, they all returned together to the fort before supper: and as a pledge of sincere reconciliation, both he and his wife passed the night in the tent of Mr. Banks. That very night, notwithstanding their presence, one of the natives attempted to scale the barracadoes of the fort; but, being discovered by one of our centinels, he ran away much faster than any of our people could follow him. The temptation which caused him to attempt what might have cost him his life, was, doubtless the iron and iron tools which were in use at the armourer's forge: incitements to theft which none of the Indians could resist.

On Sunday the 14th, in the morning divine service was performed at the fort. We hoped to have had the presence of some of the Indians, but before the time fixed on for beginning the service, most of them were gone home. Tubourai Tamaide and his wife were present, but though they behaved with much decency, they made no enquiries with respect to the ceremonies, and their brethren were as little inquisitive upon their return. The day thus begun with acts of devotion, was concluded with those of lewdness exhibited among the natives by way of entertainment. Among the rest a young fellow lay publicly with a girl about twelve years of age, in the presence of many of our people, and a great number of the Indians, without the least sense of impropriety or indecency. Oberea, and some women of the first rank in the country were spectators, who even gave instructions to the girl how to perform her part, which, young as she was, seemed unnecessary.

On Monday the 15th, Tubourai Tamaide was detected in having committed a theft. Mr. Banks had a good opinion of this chief, but, when his honesty was put to the test, a basket of nails, left in the corner of the tent proved irresistible. He confessed the fact of having stolen four nails, but when restitution was demanded, Tamaide said the nails were at Eparre. High words passed on the occasion, and, in the end, the Indian produced one of the nails, and was to be forgiven on restoring the rest; but his virtue was not equal

to the task, and he withdrew himself, as usual, when he had committed any offence. At this time our long-boat was so much eaten with worms, that it was found necessary to give her a new bottom. On examining the pinnace, thinking she might be in the same state, we had the satisfaction to perceive, that not a worm had touched her. This difference in the condition of the two boats we attributed to the different ingredients with which their bottoms were paid; the long-boat had been paid with varnish of pine, and the pinnace painted with white lead and oil; which last coating we think to be the most eligible for the bottoms of all boats intended for this part of the world.

On the 24th, Mr. Hicks was sent to Tootahah, who had removed from Eparre to a place called Tettahah. The chief having sent several times to request a visit from the captain, promising, at the same time, that he would acknowledge the favour by a present of some hogs, the business of Mr. Hicks was, to obtain, if possible, the hogs, upon easier terms than the required visit. He was received in a friendly manner by Tootahah, who, upon his arrival, produced one hog only, but promised three more that were at a distance the next morning. Mr. Hicks waited patiently till the appointed time; but when the morning came, he was obliged to depart with the single hog that had been presented to him.

On the 25th, Mr. Banks seeing Tubourai Tamaide and his wife Tomio at the tent for the first time since the former had been detected in stealing the nails, he endeavoured to persuade him to restore them, but in vain. As our gentlemen treated him with a reserve and coolness which he could not but perceive, his stay was short, and he departed in a very abrupt manner; nor could our surgeon the next morning persuade to effect a reconciliation by bringing down the nails.

On the 27th, Mr. Banks, Dr. Solander, Captain Cook, and some others, set out in the pinnace to visit Tootahah, who had again removed to a place called Atahourou, six miles from his last abode; and not being able to go half way thither in a boat, it was almost evening before we arrived. We found the chief, as usual, sitting under a tree with a great crowd about him. Having made our presents in due form, consisting of a yellow stuff petticoat, and other trifling articles, we were invited to supper, and to pass the night there. Our party consisted of six only; but the place was crowded with a greater number than the houses and canoes could contain. Among other guests were Oberea with her train of attendants. Mr. Banks having accepted of a lodging in Oberea's canoe, left his companions in order to retire to rest. Oberea had the charge of his cloaths; but notwithstanding her care, they were stolen, as were also his pistols, his powder horn, and several other things out of his waistcoat pockets. An alarm was given to Tootahah, in the next canoe, who went with Oberea in search of the thief, leaving Mr. Banks with only his breeches and waistcoat on, and his musket uncharged. They soon returned, but without success. Mr. Banks thought proper to put up with the loss at present, and retired a second time to rest; just as he had composed himself to sleep, he was roused by some music, and observed lights at a little distance from the shore. He then rose to go and find his companions. As soon as he approached the lights, he found the hut where Captain Cook and three others of the gentlemen lay, when he began to relate his misadventure to them; they told him in return, that they had lost their stockings and jackets. In effect Dr. Solander, who joined them the next morning, was the only one that escaped being robbed, and he had slept at a house that was a mile distant. This accident, however, did not prevent Captain Cook, Mr. Banks, and the rest that were at the hut, from attending to the music which was a sort of concert called Heiva, and consisted of drums, flutes, and several voices. They retired again to their repose, after this entertainment was over.

Their cloaths, and the other things which had been stolen, were never heard of afterwards, but Mr. Banks

got some cloaths from Oberea, in which he made a whimsical appearance.

On the 28th, we set out for the boat, having obtained only one hog which had been intended for our supper the preceding night; so that all things considered, we had little reason to be satisfied with our excursion. On our return to the boat, we had a specimen of the agility of the Indian swimmers, some of whom, merely for diversion, swam in a surf where no European boat could have lived, and where our best swimmers must have perished, had they accidentally fallen in with it.

At this time the preparations were made for viewing the transit of Venus, and two parties were sent out to make observations from different spots, that in case of failing on one place they might succeed in another. They employed themselves for some time in preparing their instruments, and instructing those gentlemen who were to go out, in the use of them; and on Thursday the first of June, they sent the long-boat with Mr. Gore, Mr. Monkhouse (the two observers) and Mr. Sporing, the latter of whom was a friend of Mr. Banks, with proper instruments to Emayo. Others were sent to find out a spot that might answer the purpose, at a convenient distance from their principal station.

The party that went towards Emayo, after rowing the greater part of the night, having hailed a canoe, were informed of a place by the Indians on board, which was judged proper for their observatory, where they accordingly fixed their tents. It was a rock that rose out of the water about 140 yards from the shore.

Saturday the 3d (the day of the transit) Mr. Banks, as soon as it was light, left them, in order to go and get fresh provisions on the island. This gentleman had the satisfaction to see the sun-rise without a cloud. The king, whose name was Tarrao, came to pay him a visit, as he was trading with the natives, and brought with him Nuna his sister. As it was customary for the people in these parts to be seated at their conferences, Mr. Banks spread his turban of Indian cloth, which he wore as a hat, upon the ground, on which they all set down. Then a hog and a dog, some coconuts, and bread-fruit were brought, being the king's present, and Mr. Banks sent for an adze, a shirt, and some beads, which were presented to his majesty, who received them with apparent satisfaction. Tubourai Tamaide, and Tomio, who had gone with Mr. Banks, came from the observatory, when Tomio, who was said to be related to Tarrao, gave him a long nail, and left a shirt as a present for Nuna. Afterwards the king, his sister, and three beautiful young women their attendants, returned with Mr. Banks to the observatory, where he shewed them the transit of Venus, when that planet was upon the sun, and acquainted them, that to view it in that situation was the cause of his undertaking a voyage to those remoter parts. According to this gentleman's account, the produce of this island is nearly the same with that of Otaheite; the people also resembled those of that island: he had seen many of them upon it who were acquainted with the nature of trading articles. The parties that were sent out to make their observations on the transit, had good success in the undertaking: though they differed rather more than might have been expected in their account of the contact.

Mr. Green's account was as follows:

	Hours.	Min.	Sec.	
The first external contact	-	9	25	} Morn.
The first internal contact, or total emersion	-	9	44	
The second internal contact, or beginning of the emersion	-	3	14	} Afternoon.
The second external contact, or total emersion	-	3	32	
			10	Latitude

Latitude of the observatory 17 deg. 29 min. 15 sec. south;—longitude, 149 deg. 32 min. 30 sec. west from Greenwich.

While the gentlemen and officers were busied in viewing the transit, some of the ship's company having broke into the store-room, took the liberty of stealing a quantity of spike-nails. After a strict search the thief was found out; he had, however, but few of the nails in his possession; but he was ordered to receive two dozen of lashes, by way of example.

On the 4th, the two parties sent out to observe the transit were absent; on which account we deferred keeping his majesty's birth-day to the next day, the 5th, when we celebrated the same, several of the Indian chiefs partook of our entertainment, and in turn drank his majesty's health by the name of Kihargo, the nearest imitation they could produce of king George. About this time an old female of some distinction dying, gave the English an opportunity of observing the ceremonies used by these islanders in disposing of the dead bodies of their people; which, as we have observed, they do not directly bury. The reader has already seen the description of the bier, the placing the bread-fruit, &c. which, according to Tubourai Tamaide's account, was a kind of offering to their gods. In the front of the square space, a sort of stile was placed where the relations of the deceased stood to give token of their grief. There were under the awning some pieces of cloth, whereon were the tears and blood of the mourners, who used to wound themselves with a shark's tooth upon these occasions. Four temporary houses were erected at a small distance, in one of which remained some of the relations of the deceased; the chief mourner resided in another; and was dressed in a particular manner, in order to perform a certain ceremony. When the corpse is rotten, the bones are buried near the spot, and these places were found to answer the purposes of religious worship, though Captain Wallis could not perceive the traces of any such worship among them. Concerning the ceremony we are about to speak of, the following is the account we have of it, which may not be unentertaining to the curious reader. It was performed on the 10th, and Mr. Banks was so desirous of being present, that he agreed to take a part in it, when he was informed, that he could not be a spectator on any other condition. He went accordingly in the evening, to the place where the body was deposited, where he was met by the relations of the deceased, and was afterwards joined by several other persons. Tubourai Tamaide was the principal mourner, whose dress was whimsical, though not altogether ungraceful. Mr. Banks was obliged to quit his European dress, and had no other covering than a small piece of cloth that was tied round his middle; his body was blacked over with charcoal and water, as were the bodies of several others, and among them some females, who were no more covered than himself. The procession then began, and the chief mourner uttered some words which were judged to be a prayer, when he approached the body, and he repeated these words as he came up to his own house. They afterwards went on, by permission, towards the fort. It is usual for the rest of the Indians to shun these processions as much as possible; they accordingly ran into the woods in great haste, as soon as this came in view. From the fort the mourners proceeded along the shore, crossed the river, then entered the woods, passing several houses, which became immediately uninhabited, and during the rest of the procession, which continued for half an hour, not an Indian was visible. Mr. Banks filled an office that they called Niniveh, and there were two others in the same character. When none of the other natives were to be seen, they approached the chief mourner, saying Imatata; then those who had assisted at the ceremony bathed in the river, and resumed their former dress. Such was this uncommon ceremony, in which Mr. Banks performed a principal part, and received applause from Tubourai Tamaide, the chief mourner. What can have introduced among these In-

No. 3.

dians so strange a custom as that of exposing their dead above ground, till the flesh is consumed by putrefaction, and then burying the bones, it is perhaps impossible to guess; nor is it less difficult to determine, why the repositories of their dead should be also places of worship.

On the 12th, the Indians having lost some of their bows and arrows, and strings of plaited hair, a complaint was made to the captain. The affair was enquired into, and the fact being well attested, the offenders received each two dozen of lashes. The same day Tubourai Tamaide brought his bow and arrows, in order to decide a challenge of shooting between him and Mr. Gore; but it appeared they had mistaken each other, Mr. Gore intending to discharge his arrow at a mark, while the Indian meant only to try who could shoot farthest. The challenge was dropped in consequence of the mistake being discovered; but Tubourai Tamaide, in order to display his skill, kneeling down, shot an arrow, unfeathered (as they all are) near the sixth part of a mile, dropping the bow the instant the arrow was discharged. Mr. Banks having this morning met several of the natives, and being informed, that a musical entertainment was expected in the evening, he, and the rest of the English gentlemen resolved to be present at the same. They went accordingly, and heard a performance on drums and flutes by a kind of itinerant musicians. The drummers sung to the music, and the English were much surprized when they found, that they were the subject of their lays. The songs they therefore concluded to be extemporary effusions, the rewards whereof were such necessities as they required.

On the 14th, in the night, an iron coal rake for the oven was stole; and many other things having at different times been conveyed away, Captain Cook judged it of some consequence, to put an end, if possible, to such practices, by making it their common interest to prevent it. He had already given strict orders, that the centinels should not fire upon the Indians, even if they were detected in the fact; but many repeated depredations determined him to make reprisals. About twenty-seven of their double canoes with sails were just arrived, containing cargoes of fish; these the captain seized, and then gave notice, that unless the rake, and all the other things that had been stolen, were returned, the vessels should be burnt. The menace produced no other effect than the restitution of the rake, all the other things remaining in their possession. The captain, however, thought fit to give up the cargoes, as the innocent natives were in great distress for want of them, and in order to prevent the confusion arising from disputes concerning the property of the different lots of goods which they had on board. About this time another incident had nearly, notwithstanding all our caution, embroiled us with the Indians. The captain having sent a boat on shore to get ballast, the officer not meeting immediately with what he wanted, began to pull down one of the sepulchral mansions of the dead; which sacrilegious act of violence was immediately opposed by the enraged islanders. Intelligence of this dispute being received by Mr. Banks, he went to the place, and a reconciliation was soon effected, which put an end to the dispute, by sending the boats crew to the river's side, where a sufficient quantity of stones were to be had without a possibility of giving offence. This was the only instance in which they offered to oppose us; and, (except the affair of the fort, which has been related) the only insult offered to an individual, was, when Mr. Monkhouse, the surgeon, took a flower from a tree which grew in one of their sepulchral inclosures. Upon this occasion, an Indian came suddenly behind him and struck him; Mr. Monkhouse laid hold of the assailant, but two of his countrymen rescued him, and then they all ran off as fast as they could.

On the 19th in the evening, while the canoes were still detained, Oberea and several of her attendants paid us a visit. She came from Tootahah's palace, in a double canoe, and brought with her a hog, bread-fruit,

fruit, and other presents, among which was a dog; but not a single article of the things that had been stolen: these she said had been taken away by her favourite Obadee, whom she had beaten and dismissed. She seemed however conscious that her story did not deserve credit, and appeared at first much terrified; thought she surmounted her fears with great fortitude, and was desirous of sleeping with her attendants in Mr. Banks's tent; but this being refused, she was obliged to pass the night in her canoe. A whole tribe of Indians would have slept in the ball tent, but were not permitted. The next morning Oberea returned, putting herself wholly in our power, when we accepted of her presents, which she doubtless thought, and justly too, the most effectual means to bring about a reconciliation. Two of her attendants were very assiduous in getting themselves husbands, in which they succeeded, by means of the surgeon and one of the lieutenants: they seemed very agreeable till bed-time, and determined to lie in Mr. Banks's tent, which they accordingly did, till the surgeon having some words with one of them Mr. Banks thrust her out, and she was followed by the rest, except Otea-Tea, who cried some time, and then he turned her out also. This had like to have become a serious affair, a duel being talked of between Mr. Banks and Mr. Monkhouse, but it was happily avoided. We had been informed that in this island dogs were esteemed more delicate food than pork, as those bred by the natives to be eaten, fed entirely upon vegetables. The experiment was tried. Tupia undertook to kill and dress the dog, which he did, by making a hole in the ground, and baking it. We all agreed it was a very good dish.

On the 21st we were visited by many of the natives, who brought with them various presents. Among the rest was a chief, named Oamo, whom we had not yet seen. He had a boy and a young woman with him. The former was carried on a man's back, which we considered as a piece of state, for he was well able to walk. Oberea and some of the Indians went from the fort to meet them, being bareheaded, and uncovered as low as the waist; circumstances we had noticed before, and judged them marks of respect, which was usually shewn to persons of high rank. When Oamo entered the tent, the young woman, though seemingly very curious, could not be prevailed upon to accompany him. The youth was introduced by Dr. Solander, but as soon as the Indians within saw him, they took care to have him very soon sent out. Our curiosity being raised by these circumstances, we made enquiry concerning the strangers, and were informed, that Oamo was the husband of Oberea, but that by mutual consent they had been for a considerable time separated, and the boy and girl were their children. The former was called Terridiri: he was heir apparent to the sovereignty of the islands, and when he had attained the proper age, was to marry his sister. The present sovereign Outou, was a minor, and the son of a prince, called Whappai. Whappai, Oamo, and Tootahah, were all brothers; Whappai was the eldest, and Oamo the second; wherefore Whappai having no child but Outou, Terridiri was heir to the sovereignty. To us it appeared singular, that a boy should reign during the life of his father; but in the island of Otahete, a boy succeeds to his father's authority and title as soon as he is born; but a regent being necessary, that office, though elective, generally falls upon the father, who holds the reins of government till the child is of age. The reason that the election had fallen upon Tootahah was on account of his warlike exploits among his brethren. Oamo was very inquisitive, asking a number of questions concerning the English, by which he appeared to be a man of understanding and penetration. At this time, a woman named Teetee, who came from the west of the island, presented to the captain an elegant garment. The ground was a bright yellow, it was bordered with red, and there were several crosses in the middle of it, which they had probably learned from the French.

On the 23d in the morning, one of our hands be-

ing missing, we enquired for him among the natives, and were told he was at Iparre, Tootahah's residence in the wood, and one of the Indians offered to fetch him back, which he did that evening. On his return he informed us, that he had been taken from the fort, and carried to the top of the bay by three men, who forced him into a canoe, after having stripped him, and conducted him to Iparre, where he received some cloaths from Tootahah, who endeavoured to prevail on him to continue there. We had reason to conclude this account true, for the natives were no sooner acquainted with his return, than they left the fort with precipitation.

On June the 26th, early in the morning, Capt. Cook setting out in the pinnace with Mr. Banks, sailed to the eastward with a design of circum-navigating the island. They went on shore in the forenoon, in a district in the government of Ahio, a young chief, who at the tents had frequently been their visitant. And here also they saw several other natives whom they knew. Afterwards they proceeded to the harbour where M. Bougainville's vessel lay, when he came to Otahete, and were shewn the watering place, and the spot where he pitched his tent.

Coming to a large bay, when the English gentlemen mentioned their design of going to the other side, their Indian guide, whose name was Titubaola, said he would not accompany them, and also endeavoured to dissuade the captain and his people from going; observing, "That country was inhabited by people who were not subject to Tootahah, and who would destroy them all." Notwithstanding they resolved to put their design in execution, loading their pieces with ball; and at last Titubaola ventured to go with them. Having rowed till it was dark, they reached a narrow isthmus which severed the island in two parts, and these formed distinct governments. However, as they had not yet got into the hostile part of the country, it was thought proper to go on shore to spend the night where Ooratoa, the lady who had paid her compliments in so extraordinary a manner at the fort, provided them with a supper, and they proceeded for the other government in the morning. They afterwards landed in the district of a chief called Maraitata, and his father was called Pahairede. The former of these names signifies the *burying place of men*, and the other *the stealer of boats*. These people gave the captain a very good reception, sold them a hog for a hatchet, and furnished them with provisions. A crowd of the natives came round the English gentlemen, amongst whom however they met only two with whom they were acquainted; but they saw several European commodities, yet they perceived none that came out of the Endeavour. Here they saw two twelve pound shot, one of which had the king's broad arrow upon it, yet the natives said they had them from M. Bougainville. They afterwards advanced till they reached that district which was under the government of Waheatua, who had a son: it was not known in whose hands the sovereign power was deposited. There they found a spacious plain with a river which they were obliged to pass over in a canoe, though the Indians that followed them swam over without any difficulty. They proceeded on their journey for a considerable way along the shore, till at last they were met by the chief, who had with him an agreeable woman, of about twenty-two years of age, who was called Toudidde. Her name was not unknown to the English, who had often heard of it; and she was supposed to bear the same rank here as Oberea bore in the other part of the island. The parts through which they now passed, appeared to be better cultivated than any of the rest, and the burial places were more in number. They were neat, and ornamented with carvings; and in one a cock was seen, which was painted with the various colours of the bird. Though the country was apparently fertile, very little bread-fruit was to be found here, a nut called Ahce, furnishing the principal subsistence of the inhabitants.

Being fatigued with their journey, they went on board their boat, and landed in the evening on an island which was called Otōoareite, to seek for refreshment. Mr. Banks

Banks going into the woods for this purpose, when it was dark could discover only one house, wherein he found some of the nuts before mentioned, and a little bread-fruit. There was a good harbour in the southern part of this island, and the surrounding country appeared to be extremely fruitful. Landing at about three miles distance they found some of the natives whom they well knew, yet it was not without difficulty that they obtained a few cocoa-nuts before they departed. When they came a little farther to the eastward, they landed again, and here they were met by Mathiabo, the chief, with whom they were not at all acquainted. He supplied them with bread-fruit and cocoa-nuts, and they purchased a hog of him for a glass bottle, which he chose in preference to all the other articles presented before him. A turkey-cock and a goose were seen here, which were much admired by the natives, and were supposed to have been left there by Capt. Wallis's people. They observed in a house near the same place several human jaw-bones, which seemed fresh, and had not lost any of the teeth, and were fastened to a board, of a semicircular figure; but they could not get any information of the cause of this extraordinary appearance.

When they left the place, the chief piloted them over the shoals. In the evening they opened the bay on the north-west side of the island, which answered to that on the south-east in such a manner as to intersect it at the isthmus. Several canoes came off here, and some beautiful women giving tokens that they should be glad to see them on shore, they readily accepted the invitation.—They met with a very friendly reception from the chief whose name was Wiverou, who gave directions to some of his people to assist them in dressing their provisions, which were now very plentiful, and they supped at Wiverou's house in company with Mathiabo. Part of the house was allotted for them to sleep in, and soon after supper they retired to rest. Mathiabo having borrowed a cloak of Mr. Banks, under the notion of using it as a coverlet when he lay down, made off with it without being perceived either by that gentleman or his companions. However, news of the robbery being presently brought them by one of the natives, they set out in pursuit of Mathiabo, but had proceeded only a very little way before they were met by a person bringing back the cloak which this chief had given up rather through fear than from any principle of honesty. On their return they found the house entirely deserted; and, about four in the morning, the sentinel gave the alarm that the boat was missing. Captain Cook and Mr. Banks were greatly astonished at this account, and ran to the water-side; but though it was a clear star-light morning, no boat was to be seen. Their situation was now extremely disagreeable. The party consisted of no more than four, having with them only one musquet and two pocket pistols, without a spare ball or a charge of powder. After having remained some time in a state of anxiety, arising from these circumstances, of which they feared the Indians might take advantage, the boat which had been driven away by the tide, returned; and Mr. Banks and his companions had no sooner breakfasted than they departed. This place is situated on the north side of Tiarrabou, the south east peninsula of the island, about five miles east from the isthmus, with a harbour equal to any in those parts. It was fertile and populous, and the inhabitants every where behaved with great civility.

The last district in Tiarrabou, in which they landed, was governed by a chief named Omoe. He was then building a house, and was very earnest to purchase a hatchet, but the gentlemen had not one left. He would not trade for nails, and they embarked, the chief, however, following them in his canoe with his wife. They were afterwards taken on board, but when they had sailed about a league, desired to be put on shore. Their request was complied with, when the captain met with some of Omoe's people, who brought with them a very large hog. The chief agreed to exchange the hog for an axe and a nail, and to bring the

beast to the fort. As the hog was a very fine one, Mr. Banks accepted the offer. They saw at this place one of the Indian Eatuas, a sort of image, made of wicker-work, which resembled a man in figure; it was near seven feet in height, and was covered with black and white feathers; on the head were four protuberances, called by the natives Tata etc, that is, little men. Having taken their leave of Omoe, the gentlemen set out on their return. They went on shore again, after they had rowed a few miles, but saw nothing, except a sepulchral building, which was ornamented in an extraordinary manner. The pavement, on which was erected a pyramid, was very neat; at a small distance there was a stone image, very uncouthly carved, but which the natives seemed to hold in high estimation. They passed through the harbour which was the only one fit for shipping, on the south of Opoureonou, situate about five miles to the westward of the isthmus, between two small islands, not far from the shore, and within a mile of each other. They were now near the district called Paparra, which was that where Oamo and Oberea governed, and where the travellers intended to spend the night. But when Mr. Banks and his company landed, about an hour before it was dark, it appeared they were both set out to pay them a visit at the fort. However, they slept at Oberea's house, which was neat, though not large, and of which there was no inhabitant but her father, who shewed them much civility.

They took this opportunity of walking out upon a point upon which they had observed at a distance some trees called Etoa, which usually grow upon the burial places of these islanders. They call those burying grounds Morai. And here Mr. Banks saw a vast building, which he found to be the Morai of Oamo and Oberea, which was the most considerable piece of architecture in the island. It consisted of an enormous pile of stone-work, raised in the form of a pyramid, with a flight of steps on each side. It was near 270 feet long, about one third as wide, and between 40 and 50 feet high. The foundation consisted of rock stones; the steps were of coral, and the upper part was of round pebbles, all of the same shape and size. The rock and coral-stones were squared with the utmost neatness and regularity, and the whole building appeared as compact and firm as if it had been erected by the best workmen in Europe. What rendered this last circumstance the more extraordinary was the consideration that when this pile was raised, the Indians must have been totally destitute of iron tools either to shape their stones or for any other necessary purpose, nor had they mortar to cement them when made fit for use; so that a structure of such height and magnitude must have been a work of infinite labour and fatigue. In the centre of the summit was the representation of a bird carved in wood; close to this was the figure of a fish in stone. The pyramid constituted part of one side of a court or square, the sides of which were nearly equal; and the whole was walled in, and paved with flat stones, notwithstanding which pavement, several plantains, and trees which the natives call Etoa, grew within the inclosure. At a small distance to the westward of this edifice was another paved square that contained several small stages, called Ewattas by the natives; which appeared to be altars, whereon they placed the offerings to their gods. Mr. Banks afterwards observed whole hogs placed upon these stages or altars.

On Friday the 30th, they arrived at Otahorou, where they found their old acquaintance Tootahah, who received them with great civility, and provided them a good supper and convenient lodging; and though they had been so shamefully plundered the last time they slept with this chief, they spent the night in the greatest security, none of their cloaths nor any other article being missing the next morning. They returned to the fort at Port Royal Harbour on the first of July, having discovered the island, including both peninsulas, to be about 100 miles in circumference.

After their return from this tour, they were very much in want of bread-stuff, none of which they had been

been able to provide themselves with, as they had seen but little in the course of their journey; but their Indian friends coming round them, soon supplied their want of provisions.

On the 3d, Mr. Banks made an excursion, in order to trace the river up the valley to its source, and to remark how far the country was inhabited along the banks of it. He took some Indian guides with him, and after having seen houses for about six miles, they came to one which was said to be the last that could be met with. The master presented them with coconuts and other fruits, and they proceeded on their walk, after a short stay. They often passed through vaults formed by rocky fragments in the course of their journey, in which, as they were told, benighted travellers sometimes took shelter. Pursuing the course of the river about six miles farther, they found it banked on both sides by rocks almost 100 feet in height, and nearly perpendicular; a way, however, might be traced up these precipices, along which their Indian guides would have conducted them, but they declined the offer, as there did not appear to be any thing at the summit which could repay them for the toil and dangers of ascending it. Mr. Banks sought in vain for minerals among the rocks, which were naked almost on all sides, but no mineral substances were found. The stones every where exhibited signs of having been burnt, which was the case of all the stones that were found while they staid at Oraheite, and both there and in the neighbouring islands the traces of fire were evident in the clay upon the hills. On the 4th, a great quantity of the seeds of water-melons, oranges, limes and other plants, brought from Rio de Janeiro were planted on each side of the fort, by Mr. Banks, who also plentifully supplied the Indians with them, and planted many of them in the woods. Some melons, the seeds of which had been sown on the first arrival of the English at the island, grew up and flourished before they left it.

By this time they began to think of making preparations to depart; but Oamo, Oberea, and their son and daughter visited them before they were ready to sail. As to the young woman (whose name was Toimata) she was curious to see the fort, but Oamo would not permit her to enter. The son of Waheatua, chief of the south-east peninsula, was also here at the same time; and they were favoured with the company of the Indian who had been so dextrous as to steal the quadrant, as above related. The carpenters being ordered to take down the gates and palisades of the fort, to be converted into fire-wood for the Endeavour, one of the natives stole the staple and hook of the gate; he was pursued in vain, but the property was afterwards recovered, and returned to the owners by Tubourai Tamaide.

Before their departure, two circumstances happened which gave Capt. Cook some uneasiness. The first was, that two foreign sailors having been abroad, one of them was robbed of his knife, which as he was endeavouring to recover, he was dangerously hurt with a stone by the natives, and his companion also received a slight wound in the head. The offenders escaped, and the captain was not anxious to have them taken, as he did not want to have any disputes with the Indians.

Between the 8th and 9th, two young marines one night withdrew themselves from the fort, and in the morning were not to be met with. Notice having been given the next day that the ship would sail that or the ensuing day; as they did not return, Capt. Cook began to be apprehensive that they designed to remain on shore; but as he was apprised in such a case no effectual means could be taken to recover them without running a risque of destroying the harmony subsisting between the English and the natives, he resolved to wait a day, in hopes of their returning of their own accord. But as they were still missing on the tenth in the morning, an enquiry was made after them, when the Indians declared, that they did not propose to return, having taken refuge among the mountains, where it was im-

possible for them to be discovered; and added, that each of them had taken a wife. In consequence of this, it was intimated to several of the chiefs that were in the fort with the women, among whom were Tubourai Tamaide, Tomio, and Oberea, that they would not be suffered to quit it till the deserters were produced. They did not shew any signs of fear or discontent, but assured the captain that the marines should be sent back. In the mean time Mr. Hicks was dispatched in the pinnace to bring Tootahah on board the ship, and he executed his commission without giving any alarm. Night coming on, Capt. Cook thought it not prudent to let the people, whom he had detained as hostages, remain at the fort; he therefore gave orders to remove them on board, which greatly alarmed them all, especially the females, who testified the most gloomy apprehensions by floods of tears. Capt. Cook escorted Oberea and others to the ship; but Mr. Banks remained on shore with some Indians, whom he thought it of less importance to detain. In the evening one of the marines was brought back by some of the natives, who reported, that the other and two of our men who went to recover them, would be detained while Tootahah was confined. Upon this Mr. Hicks was immediately sent off in the long boat, with a strong body of men to rescue the prisoners; at the same time the captain told Tootahah, that it was incumbent on him to assist them with some of his people, and to give orders in his name, that the men should be set at liberty; for that he would be expected to answer for the event. Tootahah immediately complied, and this party released the men without any opposition.

On the 11th, about seven in the morning, they returned, but without the arms that had been taken from them when they were made prisoners; these, however, being restored soon after, the chiefs on board were allowed to return, and those who had been detained on shore were also set at liberty. On examining the deserters it appeared, that the Indians had told the truth, they having chosen two girls, with whom they would have remained in the island. At this time the power of Oberea was not so great as it was when the Dolphin first discovered the island. Tupia, whose name has been often mentioned in this voyage, had been her prime minister. He was also the chief priest, consequently, well acquainted with the religion of the country. He had a knowledge of navigation, and was thoroughly acquainted with the number, situation, and inhabitants of the adjacent islands. This chief had often expressed a desire to go with us when we continued our voyage.

On the 12th in the morning he came on board, with a boy about twelve years of age, his servant, named Taiyota, and requested the gentlemen on board, to let him go with him. As we thought he would be useful to us in many particulars, we unanimously agreed to comply with his request. Tupia then went on shore for the last time to bid farewell to his friends, to whom he gave several baubles as parting tokens of remembrance.

Mr. Banks, after dinner, being willing to obtain a drawing of the Morai, which Tootahah had in his possession at Eparre, Capt. Cook accompanied him thither in the pinnace, together with Dr. Solander. They immediately upon landing repaired to Tootahah's house, where they were met by Oberea and several others. A general good understanding prevailed. Tupia came back with them, and they promised to visit the gentlemen early the next day, as they were told the ship would then sail.

On the 13th these friendly people came very early on board, and the ship was surrounded with a vast number of canoes, filled with Indians of the lower fort. Between eleven and twelve we weighed anchor; and notwithstanding all the little misunderstandings between the English and the natives, the latter, who possessed a great fund of good nature and much sensibility, took their leave, weeping in an affectionate manner. As to Tupia he supported himself through

CHART
 (OF THE ISLAND)
 OTAHIEETEE
 BY
 CAPT^N COOK
 1769

Heat Longitude from Greenwich

London. Published by A. Hall, Wharf at the Kings Arms A^d to Intersecter Row.

this scene with a becoming fortitude. Tears flowed from his eyes, it is true, but the effort that he made to conceal them did him an additional honour. He went

with Mr. Banks to the mast-head, and waving his hand took a last farewell of his country. Thus we departed from Otaheite, after a stay of just three months.

C H A P. V.*

An historical and descriptive account of Otaheite—Of the island and its productions—Of the inhabitants—their dress—Dwellings—Manner of living—Diversions—Manufactures—Arts—Sciences—Language—Diseases—Religious ceremonies—and government.

PORT Royal bay, in the island of Otaheite, as settled by captain Wallis, we found to be within half a degree of its real situation; and point Venus, the northern extremity of this island, and the eastern part of the bay, lies in 149 deg. 30 min. longitude. A reef of coral rock surrounds the island, forming several excellent bays, among which, and equal to the best of them, is Port Royal. This bay, called by the natives Matavai, may easily be discovered by a remarkable high mountain in the center of the island, bearing due south from Point Venus. To sail into it, either keep the west point of the reef that lies before Point Venus, close on board, or give it a birth of near half a mile, in order to avoid a small shoal of coral rocks, whereon there is but two fathom and an half of water. The most proper ground for anchoring is on the eastern side of the bay. The shore is a fine sandy beach, behind which runs a river of fresh water, very convenient for a fleet of ships. The only wood for firing upon the whole island is that of fruit trees, which must be purchased of the natives, or it is impossible to live on friendly terms with them. The face of the country is very uneven. It rises in ridges that run up into the middle of the island, where they form mountains which may be seen at the distance of sixty miles. Between these ridges and the sea is a border of low land of different breadths in different parts, but not exceeding any where a mile and a half. The soil being watered by a number of excellent rivulets, is extremely fertile, and covered with various kinds of fruit trees, which form almost one continued wood. Even the tops of the ridges are not without their produce in some parts. The only parts of the island that are inhabited, are the low lands, lying between the foot of the ridges and the sea. The houses do not form villages, but are ranged along the whole border, at about fifty yards distant from each other. Before them are little groups of the plantain trees, which furnish them with cloth. According to Tupia's account, this island could furnish above six thousand fighting men. The produce is bread-fruit, cocoa-nuts, bananas, sweet potatoes, yams, jamba, a delicious fruit, sugar-cane, the paper mulberry, several sorts of figs, with many other plants and trees, all which the earth produces spontaneously, or with little culture. But here are no European fruit, garden-stuff, pulse, nor grain of any kind. The tame animals are hogs, dogs, and poultry; the wild, ducks, pigeons, parrots, and a few other birds. The only quadrupeds are rats, and not a serpent is to be found. In the sea is a great variety of excellent fish, which constitutes their chief luxury, and to catch it their chief employment.

The people in general are of a larger make than the Europeans. The males are mostly tall, robust, and finely shaped; the women of the higher class above the size of our English ladies, but those of inferior

rank are below our standard, and some of them very short. Their natural complexion is a fine clear olive, or what we call a brunette, their skin delicately smooth, and agreeably soft. Their faces in general are handsome, and their eyes full of sensibility. Their teeth are remarkably white and regular, their hair for the most part black, and their breath is entirely free from any disagreeable smell. The men, unlike the original inhabitants of America, have long beards, which they wear in various shapes. Circumcision is generally practised among them from a motive of cleanliness, and they have a term of reproach with which they upbraid those who do not adopt this custom. Both sexes always eradicate the hair from their arm-pits, and they reproached our gentlemen with want of cleanliness: their motions are easy and graceful, and their behaviour, when unprovoked, affable and courteous. Contrary to the custom of most other nations, the women of this country cut their hair short, whereas the men wear it long, sometimes hanging loose upon their shoulders, at other times tied in a knot on the crown of the head, in which they stick the feathers of birds of various colours. A piece of cloth, of the manufacture of the country, is frequently tied round the head of both sexes in the manner of a turban, and the women plait very curiously human hair into long strings, which being folded into branches, are tied on their foreheads by way of ornament. They have a custom practised in many hot countries, of anointing their hair with cocoa-nut oil, the smell of which is not very agreeable. Having, among their various inventions no sorts of combs, they were infested with vermin, which they quickly got rid of when furnished with those convenient instruments.

They stain their bodies by indenting or pricking the flesh with a small instrument made of bone, cut into short teeth, which indentures they fill with a dark blue or blackish mixture, prepared from the smoke of an oily nut (burnt by them instead of candles) and water. This operation, called by the natives Tartaowing, is exceedingly painful, and leaves an indelible mark on the skin. It is usually performed when they are about ten or twelve years of age, and on different parts of the body; but those which suffer most severely are the breech and the loins, which are marked with arches, carried one above another a considerable way up the back. Mr. Banks was present at an operation of tartaowing, performed upon the posteriors of a girl about twelve years old. It was executed with an instrument that had twenty teeth, and at each stroke, which was repeated every moment, serum mixed with blood issued. She bore the pain with great resolution for several minutes; but at length it became so intolerable, that she murmured and burst into most violent lamentations; but her operator was inexorable, whilst some females present both chid and beat her. Mr. Banks was a

* We here beg leave to remark to our very NUMEROUS SUBSCRIBERS, that this much admired Work is not only far preferable to any other publication of the kind whatever, on account of its Elegance, large Size, Cheapness, Authenticity, and its including all Capt. Cook's Voyages Complete, written in an admirably pleasing and elegant style, but also because every single Sheet of our Letter-press comprehends at least as much Matter as is given in three Sheets belonging to other Works of the kind, which, to catch the Penny, by spinning out the Subject to an unnecessary length, is offered to the public at an extravagant Price. The common reduced Magazine Size, in which separate Parts of these Works have been attempted to be published, we find is also universally objected to by the public: so that by the publication of this LARGE FOLIO EDITION of ALL Capt. COOK'S VOYAGES, &c. COMPLETE, the public at large will be agreeably accommodated, not only by being possessed at an easy Rate of such a vast Quantity of Matter included by our close Method of Printing, but likewise by acquiring at the same Time all the SPLENDID LARGE FOLIO COPPER-PLATES (not on a reduced Scale, but) in the ORIGINAL SIZE, in Numbers at only SIXPENCE each.

spectator for near an hour, during which time one side only was tattooed, the other having undergone the ceremony some time before, and the arches upon the loins, which are the most painful, but which they most value, were yet to be made.

They cloath themselves in cloth and matting of various kinds: the first they wear in fine, the latter in wet weather. These are in different forms, no shape being preserved in the pieces, nor are they sewed together. The women of a superior class wear three or four pieces. One, which is of considerable length, they wrap several times round their waist, and it falls down to the middle of the leg. Two or three other short pieces, with a hole cut in the middle of each, are placed on one another, and their heads coming through the holes, the long ends hang before and behind, both sides being open, by which means they have the free use of their arms.

The mens dress is very similar, differing only in this instance, that one part of the garment instead of falling below the knees is brought between the legs. This dress is worn by all ranks of people, the only distinction being quantity in the superior class. At noon both sexes appear almost naked, wearing only a piece of cloth that is tied round the waist. Their faces are shaded from the sun with small bonnets, made of cocoa-nut leaves or matting, which are constructed in a few minutes. The men sometimes wear a sort of wig of human or dog's hair, or of cocoa-nut strings, woven on a single thread, fastened under the hair, and hanging down behind. Both men and women wear ear-rings on one side, consisting of shells, stones, berries, or small pearls; but they soon gave the preference to the beads brought by the Endeavour's company. The boys and girls go quite naked; the first till they are seven or eight years old; the latter till they are about five.

The natives of Otaheite seldom use their houses but to sleep in, or to avoid the rain, as they eat in the open air, under the shade of a tree. In those there are no divisions or apartments. Their cloaths serve them for covering in the night. The master and his wife repose in the middle; then the married people; next the unmarried females; then the unmarried men; and in fair weather the servants sleep in the open air. The houses of the chiefs, however, differ in some particulars. There are those that are very small, and so constructed as to be carried in canoes: all sides of them are inclosed with the leaves of the cocoa-nut; the air nevertheless penetrates. In these the chief and his wife only sleep. We likewise saw houses that are general receptacles for the inhabitants of a district, many of them being more than 200 feet in length, 40 in breadth, and 70 or 80 feet high. They are constructed at the common expence, and have an area on one side, surrounded with low palisades; but like the others without walls.

Their cookery consists chiefly in baking, the manner of doing which has been before noticed. When a chief kills a hog, which is but seldom, he divides it equally among his vassals. Dogs and fowls are more common food. When the bread-fruit is not in season, cocoanuts, bananas, plantains, &c. are substituted in its stead. They bake their bread-fruit in a manner which renders it somewhat like a mealy potatoe. Of this three dishes are made, by beating them up with bananas, plantains, or sour paste, which is called by them Mahie.

Sour paste is made by taking bread-fruit not thoroughly ripe, and laying it in heaps covered with leaves, by which means it ferments. The core is then taken out, and the fruit put into a hole lined with grass: it is then again covered with leaves, upon which large stones are placed; this produces a second fermentation; after which it grows sour, without any other change for a long time. They take it from this hole as they have occasion for it, and make it into balls. It is then rolled up in plantain leaves and baked. As it will keep for some weeks, they eat it both hot and cold. Such is the food of this people, their sauce to which is only salt water. As to their drink it is generally confined to water, or the milk of the cocoa-nut, though some of them would drink so freely of our English liquors as to become quite intoxicated, such instances, however, were

occasioned more by ignorance than design, as they were never known to practice a debauch of this kind a second time. We were told, it is true, that their chiefs sometimes became inebriated by drinking the juice of a plant called Ava, but of this we saw not a single instance during the time we remained on the island.

The chief eats generally alone, unless when visited by a stranger, who is permitted sometimes to be his mess-mate. Not having known the use of a table, they sit on the ground, and leaves of trees spread before them serve as a table-cloth. Their attendants, who are numerous, having placed a basket by the chiefs, containing their provisions, and cocoa-nut shells of fresh and salt water, set themselves down around them. They then begin their meals with the ceremony of washing their mouths and hands; after which they eat a handful of bread-fruit and fish, dipt in salt water alternately, till the whole is consumed, taking a sip of salt water between almost every morsel. The bread-fruit and fish is succeeded by a second course, consisting of either plantains or apples, which they never eat without being pared. During this time a soft fluid of paste is prepared from the bread-fruit, which they daub out of cocoa-nut shells: this concludes the meal; and their hands and mouths are again washed as at the beginning. These people eat an astonishing quantity of food at a meal. Mr. Banks and others saw one of them devour three fish of the size of a small carp, four bread-fruits, as large as a common melon, thirteen or fourteen plantains seven inches long, and above half as big round; to all which was added a quart of the paste by way of drink, to digest the whole.

The inhabitants of this island, though apparently fond of the pleasures of society, have yet an aversion to holding any intercourse with each other at their meals; and they are so rigid in the observation of this custom, that even brothers and sisters have their separate baskets of provisions, and generally sit at the distance of some yards when they eat, with their backs to each other, and not exchanging a word during the whole time of their repast. The middle aged of superior rank go usually to sleep after dinner; but, which is somewhat remarkable, older people are not so indolent.

Music, dancing, wrestling, and shooting with the bow, constitute the greatest part of their diversions. Flutes and drums are the only musical instruments among them. Their drums are formed of a circular piece of wood, hollow at one end only. These are covered with the skin of a shark, and beaten with the hand instead of a stick. Their songs are extempore, and frequently in rhyme, but they consist only of two lines; these couplets are often sung by way of evening amusements, between sun-set and bed-time; during which interval they burn candles made of an oily nut, fixing them one above another upon a small stick that is run through the middle: some of these candles will burn a long time, and afford a pretty good light. Among other amusements, they have a dance called Timorodee, which is generally performed by ten or a dozen young females, who put themselves into the most wanton attitudes, keeping time during the performance with the greatest nicety and exactness. Pregnant women are excluded from these dances.

One of the worst customs of the people of Otaheite, is that which several of the principal people of the island have adopted of uniting in an association, wherein no woman confines herself to any particular man, by which means they obtain a perpetual society. These societies are called Arcooy. The members have meetings where the men amuse themselves with wrestling, and the women dance the Timorodee in such a manner as is most likely to excite the desires of the other sex, and which were frequently gratified in the assembly. A much worse practice is the consequence of this. If any of the women prove with child, the infant is destroyed, unless the mother's natural affection should prevail with her to preserve its life, which, however, is forfeited unless she can procure a man to adopt it. And where she succeeds in this, she is expelled from the society, being called Whan-nownow,

rownow, which signifies a bearer of children, by way of reproach.

Personal cleanliness is much esteemed among these Indians. Both sexes are particular in washing three times a day, viz. when they rise in the morning, at noon, and before they go to rest. They are also very cleanly in their cloaths, so that no disagreeable effluvia are found to arise in the largest communities.

Cloth is the chief manufacture of Otaheite, and of this there are three sorts, all which are made out of the bark of different trees, namely, the mulberry, the bread-fruit, and a tree which bears some resemblance to the West-Indian wild fig-tree. The first of these produces the finest cloth, which is seldom worn but by those of the first rank. The next sort is made of the bread-fruit tree, and the last of that which resembles the wild fig-tree. But this last sort, though the coarsest, is scarcer than the other two, which are manufactured only in small quantities, as the same manner is used in manufacturing all these cloths. The following description will suffice for the reader's information.

The bark of the tree being stripped off, is soaked in water for two or three days; they then take it out, and separate the inner bark from the external coat, by scraping it with a shell, after which it is spread out on plantain leaves, placing two or three layers over one another, care being taken to make it of an equal thickness in every part. In this state it continues till it is almost dry, when it adheres so firmly that it may be taken from the ground without breaking. After this process, it is laid on a smooth board, and beaten with an instrument made for the purpose, of the compact heavy wood called Etoa. The instrument is about fourteen inches long, and about seven in circumference; is of a quadrangular shape, and each of the four sides is marked with longitudinal grooves or furrows, differing in this instance, that there is a regular gradation in the width and depth of the grooves on each of the sides; the coarser side not containing more than ten of these furrows, while the finest is furnished with above fifty. It is with that side of the mallet where the grooves are deepest and widest that they begin to beat their cloth, and proceeding regularly, finish with that which has the greatest number. By this beating, the cloth is extended in a manner similar to the gold that is formed into leaves by the hammer; and it is also marked with small channels resembling those which are visible on paper, but rather deeper; it is in general beat very thin; when they want it thicker than common, they take two or three pieces and paste them together with a kind of glue prepared from a root called Pea. This cloth becomes exceedingly white by bleaching, and is dyed of a red, yellow, brown, or black colour; the first is exceeding beautiful, and equal, if not superior to any in Europe. They make the red colour from a mixture of the juices of two vegetables, neither of which used separately has this effect: matting of various kinds is another considerable manufacture in which they excel, in many respects, the Europeans. They make use of the coarser sort to sleep on, and in wet weather they wear the finer. They excel in the basket and wicker-work; both men and women employ themselves at it, and can make a great number of different patterns. They make ropes and lines of all sizes of the bark of the Pocrou, and their nets for fishing are made of these lines; the fibres of the cocconut they make thread of, such as they use to fasten together the several parts of their canoes; the forms of which are various, according to the use to which they are applied. Their fishing lines are esteemed the best in the world, made of the bark of the Erowa, a kind of nettle which grows on the mountains; they are strong enough to hold the heaviest and most vigorous fish, such as bonettas and albicores; in short, they are extremely ingenious in every expedient for taking all kinds of fish.

The tools which these people make use of for building houses, constructing canoes, hewing stones, and for felling, cleaving, carving, and polishing timber, consists of nothing more than an adze of stone, and a chis-

sel of bone, most commonly that of a man's arm; and for a file or polisher, they make use of a rasp of coral and coral sand. The blades of their adzes are extremely tough, but not very hard, they make them of various sizes, those for felling wood weigh six or seven pounds, and others which are used for carving, only a few ounces: they are obliged every minute to sharpen them on a stone, which is always kept near them for that purpose. The most difficult task they meet with in the use of these tools, is the felling of a tree, which employs a great number of hands for several days together. The tree which is in general use is called Aoie, the stem of which is straight and tall. Some of their smaller boats are made of the bread-fruit tree, which is wrought without much difficulty, being of a light spongy nature. Instead of planes they use their adzes with great dexterity. Their canoes are all shaped with the hand, the Indians not being acquainted with the method of warping a plank.

Of these they have two kinds, one they call Ivahahs, the other Pahies; the former is used for short voyages at sea, and the latter for long ones. These boats do not differ either in shape or size, but they are in no degree proportionate, being from sixty to seventy feet in length, and not more than the thirtieth part in breadth. Some are employed in going from one island to another, and others used for fishing. There is also the Ivahah, which serves for war; these are by far the longest, and the head and stern are considerably above the body. These Ivahahs are fastened together, side by side, when they go to sea, at the distance of a few feet, by strong wooden poles, which are laid across them and joined to each side. A stage or platform is raised on the fore part, about ten or twelve feet long, upon which stand the fighting-men, whose missile weapons are slings and spears. Beneath these stages the rowers sit, who supply the place of those who are wounded. The fishing Ivahahs are from thirty or forty to ten feet in length, and those for travelling have a small house fixed on board, which is fastened upon the fore-part, for the better accommodation of persons of rank, who occupy them both day and night. The Pahies differ also in size, being from sixty to seventy feet long, they are also very narrow, and are sometimes used for fighting, but chiefly for long voyages. In going from one island to another, they are out sometimes a month, and often at sea a fortnight or twenty days, and if they had convenience to stow more provisions, they could stay out much longer. These vessels are very useful in landing, and putting off from the shore in a surf, for by their great length and high stern they landed dry, when the Endeavour's boats could scarcely land at all.

They are very curious in the construction of these boats, the chief parts or pieces whereof are formed separately without either saw, plane, chissel, or any other iron tool, which renders their fabrication more surprising and worthy observation. These parts being prepared, the keel is fixed upon blocks, and the planks are supported with props, till they are sewed or joined together with strong plaited thongs, which are passed several times through holes bored with a chissel of bone such as they commonly make use of, and when finished, they are sufficiently tight without caulking. They keep these boats with great care in a kind of shed, built on purpose to contain them.

Mr. Banks and Dr. Solander were at a loss to find out their method of dividing time, they always made use of the term Malama, which signifies the moon; whenever they spoke of time, either past or to come, they reckon thirteen of these moons, beginning again when they are expired. This proves that they have some idea of the solar year; but these gentlemen could not discover how they computed their months, to make thirteen equal to the year, as they said these months consisted of twenty-nine days, one day in which the moon was invisible being included. They, however, knew the prevailing weather that was to be expected, as well as the fruits which would be in season. As to the day, they divide it into twelve equal parts, six of which be-

long

long to the day, and the other six to the night. When they numerate, they reckon from one to ten, making use of their fingers, and changing hands, till they come to the number which they intended to express; and joining expressive signs to their words, in the course of their conversation. But they are not so expert in measuring distances, for when they attempt describing the space between one place and another, they are obliged to express it by the time that would be taken in passing it.

With regard to their language, it is soft, as it abounds with vowels, and easy to be pronounced; but very few of their nouns or verbs being declineable, it must consequently be rather imperfect. However, we found means to be mutually understood without much difficulty. The following specimen will possibly enable the reader to form some notion of the language of those islanders.

Aheine, <i>a woman</i>	Midee, <i>a child</i>
Aihoo, <i>a garment</i>	Mutee, <i>a kiss</i>
Ainao, <i>take care</i>	Myty, <i>good</i>

Meyoooo, <i>the nails</i>	Waow, <i>I</i>

The natives of this country are seldom afflicted with any diseases except sometimes an accidental fit of the cholera; but they are subject to the erysipelas, attended with cutaneous eruptions somewhat resembling the leprosy; and if they have it to any considerable degree, they are excluded from society and live alone, in a small house in some unfrequented part of the island. The management of the sick belongs to the priests, whose method of cure consists generally of prayers and ceremonies, which are repeated till they recover or die. If the former happens, it is attributed to their mode of proceeding; if the patient dies, then they urge that the disease was incurable.

The religion of these islanders appears to be very mysterious; and as the language adapted to it, was different from that which was spoken on other occasions, we were not able to gain much knowledge of it. Tupia, who gave us all the information that we got in regard to this particular, informed us, that his countrymen imagined every thing in the creation to proceed from the conjunction of two persons. One of these two first (being the supreme deity) they called Taroa-taihetoomo, and the other Tapapa; and the year which they called Tettowmatatayo, they suppose to be the daughter of these two. They also imagine an inferior sort of deities, known by the name of Eatuas, two of whom, they say, formerly inhabited the earth, and they suppose that the first man and woman descended from them. The Supreme Being they stile "The causer of earthquakes;" but more frequently address their prayers to Tane, whom they conceive to be a son of the first progenitors of nature. They believe in the existence of the soul in a separate state, and suppose that there are two situations differing in the degrees of happiness, which they consider as receptacles for different ranks, but not as places of rewards and punishments.

Their notion is, that the chiefs and principal people will have the preference to those of lower ranks. For as to their actions they cannot conceive them to influence their future state, as they believe the deity takes no cognizance of them. The office of priest is hereditary; there are several of them of all ranks: the chief is respected next to their kings; and they are in general superior to the natives, not only in point of divine knowledge, but also in that of astronomy and navigation. They are not at all concerned with the ceremony of marriage, which is only a simple agreement between the man and the woman, and when they chuse to separate, the matter is accomplished with as little ceremony as was thought necessary to bring them together. These people do not appear to worship images of any kind; but they enter their Morais with great awe and humility, their bodies being uncovered to the waist when they bring their offering to their altar.

As to their form of government, there is a sort of subordination among them which resembles the early state of all the nations of Europe when under the feudal system, which reserved authority to a small number, putting the rest intirely in their power. The ranks of the people of this island were these, Earee Rahie, signifying a king or supreme governor; Earee, answering to the title of baron; Mannahoonies, to that of vassal; and Toutou, under which name was included the lowest orders of the people, such as are called villains according to the old law term. The Earee Rahie, of which there are two here, one belonging to each peninsula, had great respect shewn them by all ranks. The Earees are lords of one or more of the districts, into which these governments are divided; and they separate their territories into lots, which are given among the Mannahoonies, who respectively cultivate the share that they hold under the baron. But they are only nominal cultivators; this, as well as all other laborious work, being done by the Toutou, or lower class of the people. The sovereign, or Earee Rahie, and the baron, or Earee, are succeeded in titles and honours by their children, as soon as they are born; but their estates remain in their possession, and subject to the management of their parents. Every district under the command of an Earee furnishes a proportionate number of fighting men, for the defence of the common cause, in case of a general attack; and they are all subject to the command of the Earee Rahie. Their weapons consist of slings, in the use of which they are very dextrous, and of long clubs remarkably hard, with which they fight obstinately and cruelly, giving no quarter to their enemies in time of battle.

While we staid at Otaheite, there was a good understanding between the Earees of the two peninsulas, though it seems that the Earee of Tearrebau called himself king of the whole island; this was a mere nominal claim, and was considered as such by the inhabitants. There is not any thing among them substituted for money, or a general medium by which every desirable object may be purchased or procured; neither can any permanent good be obtained by force or fraud. The general commerce with women sets aside almost every excitement to commit adultery. In a word, in a government so little polished, though distributive justice cannot be regularly administered; as, at the same time, there can be but few crimes whercon to exercise it, the want of this justice is not so severely felt as in more civilized societies.

Soon after our arrival at this island, we were apprised of the natives having the French disease among them. The islanders called it by a name expressive of its effects, observing that the hair and nails of those who were first infected by it, fell off, and the flesh rotted from the bones, while their countrymen, and even nearest relations, who were unaffected, were so much terrified at its symptoms, that the unhappy sufferer was often forsaken by them, and left to perish in the most horrible conditions.

Thus have we given an accurate, full, and complete description of the island in its present state; we shall only add a few remarks, which we apprehend may be of

of use to such gentlemen in the navy, who may hereafter have it in their orders to touch at the same. As this island can be useful only by supplying ships with refreshments in their passage through these seas, it might be made to answer fully this important end; European cattle, plants, garden stuff, and the most useful vegetables, would doubtless flourish in so rich a soil. The climate is remarkably fine, the heat is not troublesome, nor do the winds blow constantly from the east. We had frequently a fresh gale from the S. W. sometimes, though very seldom, from the N. W. We learnt from Tupia, that south westerly winds prevail in October, November and December, and we have

no doubt but this is true. At the time the winds are variable, they are always accompanied by a swell from the S. W. or W. S. W. The same swell happens on a calm, and when the atmosphere is loaded with clouds, which shews that the winds are variable, or westerly out at sea, for with a trade wind the weather is clear. In these parts the trade wind does not extend farther to the south than twenty degrees, beyond which we generally found a gale from the westward. The tides here are perhaps as inconsiderable as in any part of the world. A south or south by west moon makes high water in the harbour of Matavai, and its perpendicular height seldom exceeds ten or twelve inches.

C H A P. VI.

Some memoirs of the life and public services of Capt. James Cook, here introduced at the request of a great number of our very numerous readers—The Endeavour continues her voyage—Visits the islands in the neighbourhood of Otaheite—An account of several incidents, and of various particulars relative to the inhabitants—The passage of the Endeavour from Otaheite to New Zealand—Events on going ashore, and incidents while the ship was in Poverty Bay—This and the adjacent country described—Excursions to Cape Turnagain, and return to Tolaga—The inhabitants described, and a narrative of what happened while we were on that part of the coast—The range from Tolaga to Mercury Bay—Incidents that happened on board the Endeavour and ashore—A description of the country and its fortified villages—She sails from Mercury Bay to the Bay of Islands—A description of the Indians on the banks of the River Thames—And of the timber that grows there—Interviews and skirmishes with the natives on an island, and on different parts of the coast—Range from the Bay of Islands round North Cape.

We beg the public will pardon the following digression, as we give in this part of our work the following memoirs of Capt. Cook's life and public services, at the particular request of a great number of our numerous Subscribers, who wish to be gratified immediately with authentic information respecting this most celebrated Navigator.

Notwithstanding the ignorant assertions fostered on the public by editors of other publications of the kind, we have authority to say (the Rev. Mr. Grenside's testificate being in the possession of our publisher) that the late Capt. James Cook was born at Marton, in the North Riding of Yorkshire, on February 3, 1728. His father, who was a day labourer (a circumstance by no means to the disgrace but honour of our unparalleled voyager) in that village, put his son at an early age apprentice to a shop-keeper in a neighbouring town.

His natural inclination not having been consulted on this occasion, he soon quitted the counter from disgust, and bound himself for nine years, to the master of a vessel in the Coal-trade. At the breaking out of the war in 1755, being impressed, he entered into the king's service, on board the Eagle, at that time commanded by Capt. Hamer, and afterward by Sir Hugh Palliser, who soon discovered his merit, and introduced him on the quarter-deck.

In the year 1758, we find him master of the Northumberland, the flag ship of Lord Colville, who had then the command of the Squadron stationed on the coast of America. It was here, as he has often been heard say, that, during a hard winter, he first read Euclid, and applied himself to the study of mathematics and astronomy, without any other assistance, than what a few books, and his own industry afforded him. At the same time, that he thus found means to cultivate and improve his mind, and to supply the deficiencies of an early education, he was engaged in most of the busy and active scenes of the war in America. At the siege of Quebec, Sir Charles Saunders committed to his charge the execution of services, of the first importance in the naval department. He piloted the boats to the attack of Montmorency; conducted the embarkation to the Heights of Abraham, examined the passage, and laid buoys for the security of the large ships in proceeding up the river. The courage and address with which he acquitted himself in these services, gained him the warm friendship of Sir Charles Saunders and Lord Colville, who continued to patronize

him during the rest of their lives, with the greatest zeal and affection. At the conclusion of the war, he was appointed, through the recommendation of Lord Colville, and Sir Hugh Palliser, to survey the Gulf of St. Lawrence, and the coasts of Newfoundland. In this employment he continued till the year 1767, when he was fixed on by Sir Edward Hawke, to command an expedition (being his first voyage which we are now about relating) to the South Seas; for the purpose of observing the transit of Venus, and prosecuting discoveries in that part of the globe.

From this period, as his services increased in usefulness to the public, so his reputation proportionably advanced to a height too great to be affected by our panegyric. Indeed, he appears to have been most eminently and peculiarly qualified for this species of enterprise. The earliest habits of his life, the course of his services, and the constant application of his mind, all conspired to fit him for it, and gave him a degree of professional knowledge, which falls to the lot of very few.

The constitution of his body was robust, inured to labour, and capable of undergoing the severest hardships. His stomach bore, without difficulty, the coarsest and most ungrateful food. Indeed, temperance in him was scarcely a virtue; so great was the indifference with which he submitted to every kind of self-denial. The qualities of his mind were of the same hardy, vigorous kind with those of his body. His understanding was strong and perspicacious. His judgement, in whatever related to the services he was engaged in, quick and sure. His designs were bold and manly; and both in the conception, and in the mode of execution, bore evident marks of a great original genius. His courage was cool and determined, and accompanied with an admirable presence of mind in the moment of danger. His manners were plain and unaffected. His temper might perhaps have been justly blamed, as subject to hastiness and passion, had not these been disarmed by a disposition benevolent and humane.

Such were the outlines of Capt. Cook's character; but its most distinguishing feature was, that unremitting perseverance in the pursuit of his object, which was not only superior to the opposition of dangers, and the pressure of hardships, but even exempt from the want of ordinary relaxation. During the three long and tedious voyages in which he was engaged, his eagerness and activity were never in the least abated. No incidental temptation could detain him for a moment, even those intervals of recreation, which sometimes unavoidably

avoidably occurred, and were looked for by us with a longing, that persons who have experienced the fatigues of service, will readily excuse, were submitted to by him with a certain impatience, whenever they could not be employed in making further provision for the more effectual prosecution of his designs.

It is not necessary, here, to enumerate the particular instances in which these qualities were displayed, during the great and important enterprizes in which he was engaged. We shall content ourselves with stating the result of those services, under the two principal heads to which they may be referred, those of geography and navigation, placing each in a separate and distinct point of view.

Perhaps no science ever received greater additions from the labours of a single man, than geography has done from those of Captain Cook. In his first voyage to the South Seas, he discovered the Society Islands; determined the insularity of New Zealand; discovered the straits which separate the two islands, and are called after his name, and made a complete survey of both. He afterwards explored the eastern coast of New Holland, hitherto unknown, an extent of twenty-seven degrees of latitude, or upwards of two thousand miles.

In his second expedition round the world, he resolved the great problem of a southern continent; having traversed that hemisphere between the latitudes of 40 and 70 degrees, in such a manner, as not to leave a possibility of its existence, unless near the pole, and out of the reach of navigation. During this voyage, he discovered New Calidonia, the largest island in the Southern Pacific, except New Zealand; the island of Georgia, and an unknown coast, which he named Sandwich Land, the thule of the southern hemisphere; and having twice visited the tropical seas, he settled the situations of the old, and made several new discoveries, which shall likewise all be particularized in the following sheets.

But this third voyage (a full account of which we shall also give in this work) is distinguished by the extent and importance of its discoveries. Besides several smaller islands in the Southern Pacific, he discovered to the north of the equinoctial line, the groupe called the Sandwich islands; which, from their situations and productions, bid fairer for becoming an object of consequence, in the system of European navigation, than any other discovery in the South Sea. He afterwards explored what had hitherto remained unknown of the western coast of America, from the latitude of 43 to 70 deg. north, containing an extent of three thousand five hundred miles; ascertained the proximity of the two great continents of Asia and America; passed the streights between them, and surveyed the coast on each side, to such a height of northern latitude, as to demonstrate the impracticability of a passage in that hemisphere, from the Atlantic into the Pacific Ocean, either by an eastern or a western course. In short, if we except the sea of Amur, and the Japanese Archipelago, which still remain but imperfectly known to Europeans, he has completed the hydrography of the habitable globe.

In the prosecution of his third voyage this great man met with his unfortunate death, the particulars preceding which we think it necessary here to relate.

On Friday, Feb. 12, 1779, returning to Karakakooa Bay, and coming to anchor, we were surprized to find our reception very different from what it had been on our first arrival; no shouts, no bustle, no confusion, but a solitary bay, with only here and there a canoe stealing close along the shore. The impulse of curiosity, which had before operated to so great a degree, might now indeed be supposed to have ceased; but the hospitable treatment we had invariably met with, and the friendly footing on which we parted gave us some reason to expect that they would again have flocked about us with great joy on our return.

We were forming various conjectures, upon the occasion of this extraordinary appearance, when our

3

anxiety was at length relieved by the return of a boat, which had been sent on shore, and brought us word, that Terrecoboo was absent, and had left the bay under the taboo. Though this account appeared very satisfactory to most of us, yet others were of opinion, or rather, perhaps, have been led by subsequent events to imagine, that there was something at this time very suspicious in the behaviour of the natives; and that the interdiction of all intercourse with us on pretence of the king's absence, was only to give him time to consult with his chiefs, in what manner it might be proper to treat us. Whether these suspicions were well-founded, or the account given by the natives was the truth, we were never able to ascertain. For though it is not improbable that our sudden return, for which they could see no apparent cause, and the necessity of which (the Resolution being damaged in a gale) we afterwards found it very difficult to make them comprehend, might occasion some alarm; yet the suspicious conduct of Terrecoboo, who on his supposed arrival, the next morning, came immediately to visit Captain Cook, and the consequent return of the natives to their former friendly intercourse with us, are strong proofs, that they neither meant, nor apprehended any change of conduct.

In support of this opinion, we may add the account of another accident precisely of the same kind, which happened to us on our first visit, the day before the arrival of the king. A native had sold a hog on board the Resolution, and taken the price agreed on, when Parcea passing by, advised the man not to part with the hog, without an advanced price. For this, he was sharply spoken to, and pushed away; and the taboo being soon after laid on the bay, we had at first no doubt, but that it was in consequence of the offence given to the chief. Both these accidents serve to shew, how very difficult it is to draw any certain conclusion from the actions of people with whose customs, as well as language, we are so imperfectly acquainted; at the same time, some idea may be formed from them of the difficulties, at the first view, perhaps, not very apparent, which those have to encounter, who in all their transactions with these strangers, have to steer their course amidst so much uncertainty, where a trifling error may be attended with even the most fatal consequences. However true or false these conjectures may be, things went on in their usual quiet course till Saturday afternoon February 13, 1779.

Toward the evening of that day, the officer who commanded the watering party of the Discovery, came to inform us, that several chiefs had assembled at the well near the beach driving away the natives, whom he had hired to assist the sailors in rolling down the casks to the shore. He told us, at the same time, that he thought their behaviour extremely suspicious, and that they meant to give him some farther disturbance. At his request therefore a marine was sent along with him, but was suffered only to take his side arms. In a short time the officer returned, and on his saying that the islanders had armed themselves with stones, and were grown very tumultuous, Mr. King went to the spot attended by a marine with his musquet. Seeing them approach, they threw away their stones, and on their speaking to some of the chiefs, the mob were driven away, and those who chose it, were suffered to assist in filling the casks. Having left things quiet here, Mr. King went to meet Capt. Cook, who was coming on shore in the pinnace. Mr. King related to him what had just passed, and he ordered Mr. King, in case of their beginning to throw stones, or behave insolently, immediately to fire a ball at the offenders. Mr. King accordingly gave orders to the corporal to have the pieces of the centinels loaded with ball, instead of small shot.

Soon after our return to the tents, we were alarmed by a continued fire of musquets from the Discovery, which we observed to be directed at a canoe, that we saw paddling toward the shore in great haste, pursued by one of our small boats. We immediately concluded, that the firing was in consequence of some theft, and Captain Cook ordered Mr. King to follow him with a marine

rine armed, and to endeavour to seize the people as they came on shore. Accordingly they ran toward the place where we supposed the canoe would land, but were too late, the people having quitted it, and made their escape into the country before their arrival.

Capt. Cook and Mr. King were at this time ignorant that the goods had been already restored, and as they thought it probable, from the circumstances they had at first observed, that they might be of importance, were unwilling to relinquish their hopes of recovering them. Having therefore inquired of the natives which way the people had fled, they followed them till it was near dark, when judging themselves to be about three miles from the tents, and suspecting that the natives, who frequently encouraged them in the pursuit, were amusing them with false information, they thought it in vain to continue their search any longer, and returned to the beach.

During their absence, a difference of a more serious and unpleasant nature had happened; the officer who had been sent in the small boat, and was returning on board with the goods which had been restored, observing Capt. Cook and Mr. King engaged in the pursuit of the offenders, thought it his duty to seize the canoe, which was left drawn up on the shore. Unfortunately this canoe belonged to Parcea, who arriving at the same moment from on board the *Discovery*, claimed his property with many protestations of his innocence; the officer refusing to give it up, and being joined by the crew of the pinnace, which was waiting for Capt. Cook, a scuffle ensued, in which Parcea was knocked down by a violent blow on the head with an oar: the natives who were collected about the spot, and had hitherto been peaceable spectators, immediately attacked our people with such a shower of stones, as forced them to retreat with great precipitation and swim off to a rock at some distance from the shore. The pinnace was immediately ransacked by the islanders, and, but for the timely interposition of Parcea, who seemed to have recovered from the blow, and forgot it at the same instant, would soon have been entirely demolished. Having driven away the crowd, he made signs to our people, that they might come and take possession of the pinnace, and that he would endeavour to get back the things which had been taken out of it. After their departure he followed them in his canoe, with a midshipman's cap and some other trifling articles of the plunder, and, with much apparent concern at what had happened, as he asked if the *Orono* would kill him, and whether he would permit him to come on board the next day? On being assured that he should be well received, he joined noses (as their custom is) with the officers in token of friendship, and paddled over to the village of Kowrowa.

When Capt. Cook was informed of what had passed he expressed much uneasiness at it, and in returning on board, said, "I am afraid that these people will oblige me to use some violent measures, for they must not be left to imagine that they have gained an advantage over us;" however, as it was too late to take any steps this evening, he contented himself with giving orders, that every man and woman of the island on board should be immediately turned out of the ship. As soon as this order was executed, Mr. King returned on shore, and our former confidence in the natives being now much abated by the events of the day, he posted a double guard on the Morai, with orders to call him if they saw any men lurking about the beach. At about eleven o'clock, five islanders were observed creeping round the bottom of the Morai; they seemed very cautious in approaching us, and, at last finding themselves discovered, retired out of sight. About midnight, one of them venturing close up to the observatory, the sentinel fired over him, on which the men fled, and we passed the remainder of the night without farther disturbance.

Sunday morning, Feb. 14, 1779, at day break Mr. King went on board the *Resolution* for the Time-Keeper, and in his way was hailed by the *Discovery*, and informed, that their cutter had been stolen during the night, from the buoy where it was moored.

When he arrived on board, he found the marines arming, and Capt. Cook loading his double barrelled gun. Whilst he was relating to him what had happened in the night, he interrupted Mr. King with some eagerness, and acquainted him with the loss of the *Discovery's* cutter, and with the preparations he was making for its recovery. It had been his usual practice, whenever any thing of consequence was lost, at any of the islands in this ocean, to get the king or some of the principal Erees on board, and to keep them as hostages till it was restored. This method, which had been always attended with success, he meant to pursue on the present occasion; and at the same time, had given orders to stop all the canoes that should attempt to leave the bay, with an intention of seizing and destroying them if he could not recover the cutter by peaceable means. Accordingly the boats of both ships, well manned and armed, were stationed across the bay; and, before Mr. King left the ship, some great guns had been fired at two large canoes that were attempting to make their escape.

It was between seven and eight o'clock when Capt. Cook and Mr. King quitted the ship together, Capt. Cook in the pinnace, having Mr. Phillips and nine marines with him, and Mr. King in the small boat. The last orders Mr. King received from him were, to quiet the minds of the natives on his side of the bay, by assuring them they should not be hurt; to keep his people together, and to be on his guard. They then parted, the captain went towards Kowrowa, where the king resided, and Mr. King proceeded to the beach. Mr. King's first care on going ashore, was to give strict orders to the marines to remain within the tent, to load their pieces with ball, and not to quit their arms. Afterwards he took a walk to the huts of old Kaoo and the priests, and explained to them as well as he could, the object of the hostile preparations which had exceedingly alarmed them.

He found that they had already heard of the cutter's being stolen, and assured them, that though Capt. Cook was resolved to recover it and to punish the authors of the theft, yet that they and the people of the village on our side, need not be under the smallest apprehension of suffering any evil from us. He desired the priests to explain this to the people and to tell them not to be alarmed, but to continue peaceable and quiet. Kaoo asked him with great earnestness, if Terreebooo was to be hurt? He assured him he was not, and both he and the rest of his brethren seemed much satisfied with this assurance.

In the mean time Capt. Cook, having called off the launch which was stationed at the north point of the bay, and taken it along with him proceeded to Kowrowa, and landed with the lieutenant and nine marines. He immediately marched into the village, where he was received with the usual marks of respect, the people prostrating themselves before him, and bringing their accustomed offerings of small hogs. Finding that there was no suspicion of his design, his next step was to inquire for Terreebooo and the two boys his sons, who had been his constant guests on board the *Resolution*. In a short time the boys returned, along with the natives who had been sent in search of them, and immediately led Capt. Cook to the house where the king had slept. They found the old man just awake from sleep, and, after a short conversation about the loss of the cutter, from which Capt. Cook was convinced that he was in no wise privy to it, he invited him to return in the boat and spend the day on board the *Resolution*. To this proposal the king readily consented, and immediately got up to accompany him.

Things were in this prosperous train, the two boys being already in the pinnace, and the rest of the party having advanced near the water-side, when an elderly woman called Kane-kabarcea, the mother of the boys, and one of the king's favourite wives came after him, and with many tears and entreaties, besought him not to go on board. At the same time two chiefs who came along with her laid hold of him, and insisting that he should go no farther, forced him to sit down. The natives,

who

who were collecting in prodigious numbers along the shore, and had probably been alarmed by the firing of the great guns, and the appearances of hostility in the bay, began to throng round Captain Cook and their king. In this situation, the lieutenant of marines, observing that his men were huddled close together in the crowd, and thus incapable of using their arms, if any occasion should require it, proposed to the captain, to draw them up along the rocks, close to the water's edge; and the crowd readily making way for them to pass, they were drawn up in a line, at the distance of about thirty yards from the place where the king was sitting.

All this time the old king remained on the ground, with the strongest marks of terror and dejection in his countenance; Captain Cook, not willing to abandon the object for which he had come on shore, continuing to urge him, in the most pressing manner, to proceed; whilst, on the other hand, whenever the king appeared inclined to follow him, the chiefs, who stood round him, interposed, at first with prayers and entreaties, but afterward, having recourse to force and violence, insisted on his staying where he was. Captain Cook therefore finding, that the alarm had spread too generally, and that it was in vain to think any longer of getting him off, without bloodshed, at last gave up the point; observing to Mr. Phillips, that it would be impossible to compel him to go on board, without the risk of killing a great number of the inhabitants.

Though the enterprize, which had carried Capt. Cook on shore had now failed, and was abandoned, yet his person did not appear to have been in the least danger, till an accident happened, which gave a fatal turn to the affair. The boats which had been stationed across the bay, having fired at some canoes, that were attempting to get out, unfortunately had killed a chief of the first rank. The news of his death arrived at the village where Captain Cook was, just as he had left the king, and was walking slowly toward the shore. The ferment it occasioned was very conspicuous; the women and children were immediately sent off, and the men put on their war-mats, and armed themselves with spears and stones. One of the natives, having in his hands a stone, and a long iron spike (which they call a pahooa) came up to the captain, flourishing his weapon by way of defiance, and threatening to throw the stone. The captain desired him to desist, but the man persisting in his insolence, he was at length provoked to fire a load of small-shot. The man having his mat on, which the shot were not able to penetrate, this had no other effect than to irritate and encourage them. Several stones were thrown at the marines; and one of the Erees attempted to stab Mr. Phillips with his pahooa, but failed in the attempt, and received from him a blow with the butt end of his musquet. Captain Cook now fired his second barrel, loaded with ball, and killed one of the foremost of the natives. A general attack with stones immediately followed, which was answered by a discharge of musquetry from the marines, and the people in the boats. The islanders, contrary to the expectations of every one, stood the fire with great firmness; and before the marines had time to reload, they broke in upon them with dreadful shouts and yells. What followed was a scene of the utmost horror and confusion.

Four of the marines were cut off amongst the rocks in their retreat, and fell a sacrifice to the fury of the enemy; three more were dangerously wounded; and the lieutenant, who had received a stab between the shoulders with a pahooa, having fortunately reserved his fire, shot the man who had wounded him just as he was going to repeat his blow. Capt. Cook, the last time he was seen distinctly, was standing at the water's edge, and calling out to the boats to cease firing, and to pull in. If it be true, as some of those who were present have imagined, that the marines and boat-men had fired without his orders, and that he was desirous of preventing any further bloodshed, it is not improbable, that his humanity, on this occasion, proved fatal to him. For it was remarked, that whilst he faced

the natives, none of them had offered him any violence, but that having turned about to give his orders to the boats, he was stabbed in the back, and fell with his face into the water. On seeing him fall, the islanders set up a great shout, and his body was immediately dragged on shore, and surrounded by the enemy, who snatching the dagger out of each other's hands, shewed a savage eagerness to have a share in his destruction.

Thus fell this great and excellent commander! After a life of so much distinguished and successful enterprize, his death, as far as regards himself, cannot be reckoned premature; since he lived to finish the great work for which he seems to have been designed; and was rather removed from the enjoyment, than cut off from the acquisition, of glory. How sincerely his loss was felt and lamented, by those who had so long found their general security in his skill and conduct, and every consolation, under their hardships in his tenderness and humanity, it is neither necessary nor possible for us to describe; much less shall we attempt to paint the horror with which the crews were struck, and the universal dejection and dismay, which followed so dreadful and unexpected a calamity.

We shall here however subjoin a few particulars which happened subsequent to his death, and which may be naturally expected to belong to this account.

IT has been already related, that four of the marines, who attended Captain Cook, were killed by the islanders on the spot. The rest, with Mr. Phillips, their lieutenant, threw themselves into the water, and escaped under cover of a smart fire from the boats. On this occasion, a remarkable instance of gallant behaviour, and of affection for his men, was shewn by that officer. For he had scarcely got into the boat, when, seeing one of the marines, who was a bad swimmer, struggling in the water, and in danger of being taken by the enemy, he immediately jumped into the sea to his assistance, though much wounded himself; and after receiving a blow on the head from a stone, which had nearly sent him to the bottom, he caught the man by the hair, and brought him safe off. Our people continued for some time to keep up a constant fire from the boats (which during the whole transaction, were not more than twenty yards from the land), in order to afford their unfortunate companions, if any of them should still remain alive, an opportunity of escaping. These efforts, seconded by a few guns, that were fired at the same time from the Resolution, having forced the natives at last to retire, a small boat, manned by five of our young midshipmen, pulled towards the shore, where they saw the bodies, without any signs of life lying on the ground; but judging it dangerous to attempt to bring them off with so small a force, and their ammunition being nearly expended, they returned to the ships, leaving them in possession of the islanders, together with ten stands of arms.

As soon as the general consternation, which the news of this calamity occasioned throughout both crews had a little subsided, their attention was called to our party at the Morai, where the mast and sails were on shore, with a guard of only six marines. It is impossible to describe the emotions of Mr. King's mind, during the time these transactions had been carrying on, at the other side of the bay. Being at the distance only of a short mile from the village of Kowrowa, we could see distinctly an immense crowd collected on the spot where Captain Cook had just before landed. We heard the firing of the musquetry, and could perceive some extraordinary bustle and agitation in the multitude. We afterwards saw the natives flying, the boats retire from the shore, and passing and repassing, in great stillness, between the ships. Where a life so dear and valuable was concerned, it was impossible not to be alarmed, by appearances both new and threatening. But, besides this, we knew, that a long and uninterrupted course of success, in his transactions with the natives of these seas, had given the captain a degree of

con-

confidence, that we were fearful might, at some unlucky moment, put him too much off his guard; and we now saw all the dangers to which that confidence might lead, without receiving much consolation from considering the experience that had given rise to it.

Our first care, on hearing the muskets fired, was, to assure the people, who were assembled in considerable numbers, round the wall of our consecrated field, and seemed equally at a loss with ourselves how to account for what they had seen and heard, that they should not be molested; and that, at all events, we were desirous of continuing on peaceable terms with them. We remained in this posture, till the boats had returned on board, when Captain Clerke, observing, through his telescope, that we were surrounded by the natives, and apprehending they meant to attack us, ordered two four-pounders to be fired at them. Fortunately these guns, though well aimed, did no mischief, and yet gave the natives a convincing proof of their power. One of the balls broke a cocoa-nut tree in the middle, under which a party of them were sitting; and the other shivered a rock, that stood in an exact line with them. As we had, just before, given them the strongest assurances of their safety, we were exceedingly mortified at this act of hostility; and, to prevent a repetition of it, immediately dispatched a boat to acquaint Captain Clerke, that, at present, we were on the most friendly terms with the natives; and that, if occasion should hereafter arise for altering our conduct toward them, we would hoist a jack, as a signal for him to afford us all the assistance in his power.

We expected the return of the boat with the utmost impatience; and after remaining a quarter of an hour, under the most torturing anxiety and suspense, our fears were at length confirmed, by the arrival of Mr. Bligh, with orders to strike the tents as quickly as possible, and to send the sails, that were repairing, on board. Just at the same moment, our friend Kaireekkea having also received intelligence of the death of Captain Cook, from a native, who had arrived from the other side of the bay, came to us, with great sorrow and dejection in his countenance, to inquire, if it was true?

Our situation was, at this time, extremely critical and important. Not only our own lives, but the event of the expedition, and the return of at least one of the ships, being involved in the same common danger. We had the mast of the Resolution, and the greatest part of our sails, on shore, under the protection of only six marines: their loss would have been irreparable; and though the natives had not as yet shewn the smallest disposition to molest us, yet it was impossible to answer for the alteration, which the news of the transaction at Kowroa might produce. We therefore thought it prudent to dissemble our belief of the death of Captain Cook, and to desire Kaireekkea to discourage the report; lest either the fear of our resentment, or the successful example of their countrymen, might lead them to seize the favourable opportunity, which at this time offered itself, of giving us a second blow. At the same time, we advised him to bring old Kaoo, and the rest of the priests, into a large house that was close to the Morai; partly out of regard to their safety, in case it should have been found necessary to proceed to extremities; and partly to have him near us, in order to make use of his authority with the people, if it could be instrumental in preserving peace.

Having placed the marines on the top of the Morai, which formed a strong and advantageous post, and left the command with Mr. Bligh, giving him the most positive directions to act entirely on the defensive, we went on board the Discovery, in order to represent to Captain Clerke the dangerous situation of our affairs. As soon as we quitted the spot, the natives began to annoy our people with stones; and we had scarcely reached the ship, before we heard the firing of the marines. We therefore returned instantly on shore, and found things growing every moment more alarming. The natives were arming, and putting on their mats; and their numbers increased very fast. We could

also perceive several large bodies marching toward us, along the cliff which separates the village of Kakooa from the north side of the bay, where the village of Kowroa is situated.

They began, at first, to attack us with stones, from behind the walls of their inclosures, and finding no resistance on our part, they soon grew more daring. A few resolute fellows, having crept along the beach, under cover of the rocks, suddenly made their appearance at the foot of the Morai, with a design, as it seemed, of storming it on the side next the sea, which was its only accessible part; and were not dislodged, till after they had stood a considerable number of shot, and seen one of their party fall.

The bravery of one of these assailants well deserves to be particularly mentioned. For having returned to carry off his companion, amidst the fire of our whole party, a wound, which he received, made him quit the body and retire; but, in a few minutes, he again appeared, and being again wounded, he was obliged a second time to retreat. At this moment we arrived at the Morai, and saw him return the third time, bleeding and faint; and being informed of what had happened, we forbade the soldiers to fire, and he was suffered to carry off his friend; which he was just able to perform, and then fell down himself, and expired.

About this time, a strong reinforcement from both ships having landed, the natives retreated behind their walls; which giving us access to our friendly priests, we sent one of them to endeavour to bring their countrymen to some terms, and to propose to them, that if they would desist from throwing stones, we would not permit our men to fire. This truce was agreed to, and we were suffered to launch the mast, and carry off the sails, and our astronomical apparatus, unmolested. As soon as we had quitted the Morai, they took possession of it, and some of them threw a few stones; but without doing us any mischief.

It was half an hour past eleven o'clock, when we got on board the Discovery, where we found no decisive plan had been adopted for our future proceedings. The restitution of the boat, and the recovery of the body of Captain Cook were the objects, which, on all hands, we agreed to insist on; and it was our opinion, that some vigorous steps should be taken, in case the demand of them was not immediately complied with.

Though our feelings, on the death of a beloved and honoured commander may be suspected to have had some share in this opinion, yet there were certainly other reasons, and those of the most serious kind, that had considerable weight. The confidence which their success in killing our chief, and forcing us to quit the shore, must naturally have inspired; and the advantage, however trifling, which they had obtained over us the preceding day, would, we had no doubt, encourage them to make some further dangerous attempts; and the more especially, as they had little reason, from what they had hitherto seen, to dread the effects of our fire-arms. Indeed, contrary to the expectations of every one, this sort of weapon had produced no signs of terror in them. On our side, such was the condition of the ships, and the state of discipline amongst us, that had a vigorous attack been made on us, in the night, it would have been impossible to answer for the consequences.

In these apprehensions, we were supported by the opinion of most of the officers on board; and nothing seemed so likely to encourage the natives to make the attempt, as the appearance of our being inclined to an accommodation, which they could only attribute to weakness, or fear.

In favour of more conciliatory measures, it was justly urged, that the mischief was done, and irreparable; that the natives had a strong claim to our regard, on account of their former friendship and kindness; and the more especially, as the late melancholy accident did not appear to have arisen from any premeditated design: that, on the part of Terrecoboo, his ignorance of the theft, his readiness to accompany Captain Cook on board, and his having actually sent

two sons into the boat, must free him from the smallest degree of suspicion: that the conduct of his women, and the Erees, might easily be accounted for, from the apprehensions occasioned by the armed force with which Captain Cook came on shore, and the hostile preparations in the bay; appearances so different from the terms of friendship and confidence, in which both parties had hitherto lived, that the arming of the natives was evidently with a design to resist the attempt, which they had some reason to imagine would be made, to carry off their king by force, and was naturally to be expected from a people full of affection and attachment to their chiefs.

To these motives of humanity, others of a prudential nature were added; that we were in want of water, and other refreshments: that our foremast would require six or eight days work, before it could be stepped: that the spring was advancing apace; and that the speedy prosecution of our next northern expedition ought now to be our sole object: that therefore to engage in a vindictive contest with the inhabitants, might not only lay us under the imputation of unnecessary cruelty, but would occasion an unavoidable delay in the equipment of the ships.

In this latter opinion Captain Clerke concurred; and though we were convinced, that an early display of vigorous resentment would more effectually have answered every object both of prudence and humanity, were not sorry, that the spirited measures recommended were rejected. For though the contemptuous behaviour of the natives, and their subsequent opposition to our necessary operations on shore, arising from a misconstruction of our lenity, compelled us at last to have recourse to violence in our own defence; yet the circumstances of the case would, in the opinion of the world, have justified the use of force, on our part, in the first instance. Cautionary rigour is at all times invidious, and has this additional objection to it, that the severity of a preventive course, when it best succeeds, leaves its expediency the least apparent.

During the time we were thus engaged, in concerting some plan for our future conduct, a prodigious concourse of natives still kept possession of the shore; and some of them came off in canoes, and had the boldness to approach within pistol-shot of the ships, and to insult us by various marks of contempt and defiance. It was with great difficulty we could restrain the sailors from the use of their arms, on these occasions; but as pacific measures had been resolved on, the canoes were suffered to return unmolested.

In pursuance of this plan, it was determined, that Mr. King should proceed toward the shore, with the boats of both ships, well manned and armed, with a view to bring the natives to a parley, and, if possible, to obtain a conference with some of the chiefs.

If this attempt succeeded, he was to demand the dead bodies, and particularly that of Captain Cook; to threaten them with our vengeance in case of a refusal; but, by no means, to fire unless attacked; and not to land on any account whatever. These orders were delivered before the whole party, and in the most positive manner.

He left the ships about four o'clock in the afternoon; and, as we approached the shore, perceived every indication of a hostile reception. The whole crowd of natives was in motion; the women and children retreating; the men putting on their war mats, and arming themselves with long spears and daggers. We also observed, that, since the morning, they had thrown up stone breast-works along the beach, where Captain Cook had landed; probably in expectation of an attack at that place; and, as soon as we were within reach, they began to throw stones at us with slings, but without doing any mischief. Concluding, therefore, that all attempts to bring them to a parley would be in vain, unless we first gave them some ground for mutual confidence; Mr. King ordered the armed boats to stop, and went on, in the small boat alone, with a white flag in his hand, which, by a general cry of joy from the natives, he had the satisfaction to find was

instantly understood. The women immediately returned from the side of the hill, whither they had retired; the men threw off their mats; and all sat down together by the water-side, extending their arms, and inviting us to come on shore.

Though this behaviour was very expressive of a friendly disposition, yet we could not help entertaining some suspicions of its sincerity. But when we saw Koah, with a boldness and assurance altogether unaccountable, swimming off toward the boat, with a white flag in his hand, we thought it necessary to return this mark of confidence, and therefore received him into the boat, though armed; a circumstance which did not tend to lessen our suspicions. We had long harboured an unfavourable opinion of this man. The priests had always told us, that he was of a malicious disposition, and no friend of ours; and the repeated detections of his fraud and treachery, had convinced us of the truth of their representations. Add to all this, the shocking transaction of the morning, in which he was seen acting a principal part, made us feel the utmost horror at finding him so near; and as he came up to Mr. King with feigned tears, and embraced him, Mr. King was so distrustful of his intentions, that he could not help taking hold of the point of the pahooah, which he held in his hand, and turned it from him. Mr. King told him, that he had come to demand the body of Captain Cook; and to declare war against them, unless it was instantly restored. He assured him this should be done as soon as possible; and that he would go himself for that purpose; and, after begging of Mr. King a piece of iron, with much assurance, as if nothing extraordinary had happened, he leaped into the sea, and swam ashore, calling out to his countrymen, that we were all friends again.

We waited near an hour, with great anxiety for his return; during which time, the rest of the boats had approached so near the shore, as to enter into conversation with a party of the natives, at some distance from us; by whom they were plainly given to understand, that the body had been cut to pieces, and carried up the country; but of this circumstance we were not informed, till our return to the ships.

We began now to express some impatience at Koah's delay; upon which the chiefs pressed Mr. King exceedingly to come on shore; assuring him, that if he would go himself to Terreeoboo, the body would certainly be restored to him. When they found they could not prevail on him to land, they attempted, under a pretence of wishing to converse with more ease, to decoy our boat among some rocks, where they would have had it in their power to cut us off from the rest. It was no difficult matter to see through these artifices; and we were therefore strongly inclined to break off all further communication with them, when a chief came to us, who was the particular friend of Captain Clerke, and of the officers of the *Discovery*, on board which ship he had sailed, when we last left the bay, intending to take his passage to Mowee. He told us, he came from Terreeoboo to acquaint us, that the body was carried up the country; but that it should be brought to us the next morning. There appeared a great deal of sincerity in his manner; and being asked, if he told a falsehood, he hooked his two fore-fingers together, which is understood amongst these islanders as the sign of truth; in the use of which they are very scrupulous.

As we were now at a loss in what manner to proceed, Mr. Vancouver was sent to acquaint Captain Clerke with all that had passed; that our opinion was, they meant not to keep their word with us, and were so far from being sorry at what had happened, that, on the contrary, they were full of spirits and confidence on account of their late success, and sought only to gain time, till they could contrive some scheme for getting us into their power. Mr. Vancouver came back with orders for us to return on board; having first given the natives to understand, that, if the body was not brought the next morning, the town should be destroyed.

When

When they saw that we were going off, they endeavoured to provoke us by the most insulting and contemptuous gestures. Some of our people said, they could distinguish several of the natives parading about in the clothes of our unfortunate comrades; and, among them, a chief brandishing Captain Cook's hanger, and a woman holding the scabbard. Indeed, there can be no doubt, but that our behaviour had given them a mean opinion of our courage; for they could have but little notion of the motives of humanity that directed it.

In consequence of the report made to Capt. Clerke, of what we conceived to be the present temper and disposition of the islanders, the most effectual measures were taken to guard against any attack they might make in the night. The boats were moored with top-chains; additional centinels were posted on both ships; and guard-boats were stationed to row round them, in order to prevent the natives from cutting the cables. During the night we observed a prodigious number of lights on the hills, which made some of us imagine, they were removing their effects back into the country, in consequence of our threats. But we rather believe them to have been the sacrifices that were performing on account of the war, in which they imagined themselves about to be engaged; and most probably the bodies of our slain countrymen were, at that time, burning. We afterwards saw fires of the same kind, as we passed the island of Morotoi; and which, we were told by some natives then on board, were made on account of the war they had declared against a neighbouring island. And this agrees with what we learned amongst the Friendly and Society Isles, that, previous to any expedition against an enemy, the chiefs always endeavoured to animate and inflame the courage of the people by feasts and rejoicings in the night.

We remained the whole night undisturbed, except by the howlings and lamentations which were heard on shore: and early the next morning, Koah came along-side the Resolution, with a present of cloth, and a small pig, which he desired leave to present Mr. King, who was supposed by the natives, to be the son of Capt. Cook; and as he, in his life-time, had always suffered them to believe it, Mr. King was probably considered as the chief, after his death. He was questioned about the body, and, on his returning nothing but evasive answers, his presents were refused; and we were going to dismiss him, with some expressions of anger and resentment, had not Capt. Clerke, judging it best, at all events, to keep up the appearance of friendship, thought it more proper, that he should be treated with the usual respect.

This treacherous fellow came frequently to us, during the course of the forenoon, with some trifling present or other; and as we always observed him eyeing every part of the ship with great attention, we took care he should see we were well prepared for our defence.

He was exceedingly urgent, both with Capt. Clerke and Mr. King, to go on shore, laying all the blame of the detention of the bodies on the other chiefs; and assuring us, that every thing might be settled to our satisfaction, by a personal interview with Terrecoboo. However, his conduct was too suspicious to make it prudent to comply with this request; and indeed a fact came afterward to our knowledge, which proved the entire falsehood of his pretensions. For we were told, that, immediately after the action in which Captain Cook was killed, the old king had retired to a cave in the steep part of the mountain, that hangs over the bay, which was accessible only by the help of ropes, and where he remained for many days, having his victuals let down to him by cords.

When Koah returned from the ships, we could perceive that his countrymen, who had been collected, by break of day, in vast crowds on the shore, thronged about him with great eagerness; as if to learn the intelligence he had acquired, and what was to be done in consequence of it. It is very probable, that they expected we should attempt to put our threats in execution; and they seemed fully resolved to stand their

ground. During the whole morning, we heard conchs blowing in different parts of the coast; large parties were seen marching over the hills; and, in short, appearances were so alarming, that we carried out a stream anchor, to enable us to haul the ship abreast of the town, in case of an attack; and stationed boats off the north point of the bay, to prevent a surprise from that quarter.

The breach of their engagement to restore the bodies of the slain, and the warlike posture, in which they, at this time, appeared, occasioned fresh debates amongst us concerning the measures next to be pursued. It was, at last, determined, that nothing should be suffered to interfere with the repair of the mast, and the preparations for our departure; but that we should, nevertheless, continue our negotiations for the recovery of the bodies.

The greatest part of the day was taken up in getting the fore-mast into a proper situation on deck, for the carpenters to work upon it; and in making the necessary alterations in the commissions of the officers. The command of the expedition having devolved on Captain Clerke, he removed on board the Resolution, appointed Lieutenant Gore to be Captain of the Discovery, and promoted Mr. Harvey, a midshipman, who had been with Captain Cook in his two last voyages, to the vacant Lieutenantcy. During the whole day, we met with no interruption from the natives; and, at night, the launch was again moored with a top-chain; and guard-boats stationed round both ships as before.

About eight o'clock, it being very dark, a canoe was heard paddling toward the ship; and as soon as it was seen, both the centinels on deck fired into it. There were two persons in the canoe, and they immediately roared out "Tinnee," (which was the way in which they pronounced Mr. King's name), and said they were friends, and had something for him belonging to Captain Cook. When they came on board, they threw themselves at our feet, and appeared exceedingly frightened. Luckily neither of them was hurt, notwithstanding the balls of both pieces had gone through the canoe. One of them was the person, called the Taboo man, who constantly attended Captain Cook with the circumstances of ceremony we have already described; and who, though a man of rank in the island, could scarcely be hindered from performing for him the lowest offices of a menial servant. After lamenting, with abundance of tears, the loss of the Orono, he told us, that he had brought us a part of his body. He then presented to us a small bundle wrapped up in cloth, which he brought under his arm; and it is impossible to describe the horror which seized us, on finding in it, a piece of human flesh, about nine or ten pounds weight. This, he said, was all that remained of the body; that the rest was cut to pieces, and burnt; but that the head and all the bones, except what belonged to the trunk, were in the possession of Terrecoboo, and the other Erees; that what we saw had been allotted to Kaoo, the chief of the priests, to be made use of in some religious ceremony; and that he had sent it as a proof of his innocence and attachment to us.

This afforded an opportunity of informing ourselves, whether they were cannibals; and we did not neglect it. We first tried, by many indirect questions, put to each of them apart, to learn in what manner the rest of the bodies had been disposed of; and finding them very constant in one story, that, after the flesh had been cut off, it was all burnt; we at last put the direct question, Whether they had not eat some of it? They immediately shewed as much horror at the idea, as any European would have done; and asked, very naturally, if that was the custom amongst us? They afterward asked us, with great earnestness and apparent apprehension, "When the Orono would come again? and what he would do to them on his return?" The same inquiry was frequently made afterward by others; and this idea agrees with the general tenour of their conduct toward him, which shewed, that they considered him as a being of a superior nature.

We

We pressed our two friendly visitors to remain on board till morning; but in vain. They told us, that, if this transaction should come to the knowledge of the king, or chiefs, it might be attended with the most fatal consequences to their whole society; in order to prevent which, they had been obliged to come off to us in the dark; and that the same precaution would be necessary in returning on shore. They informed us farther, that the chiefs were eager to revenge the death of their countrymen; and particularly, cautioned us against trusting Koah, who, they said, was our mortal and implacable enemy; and desired nothing more ardently, than an opportunity of fighting us; to which the blowing of the conchs, we had heard in the morning, was meant as a challenge.

We learned from these men, that seventeen of their countrymen were killed in the first action at Kowrowa, of whom five were chiefs; and that Kaneena and his brother, our very particular friends, were unfortunately of that number. Eight, they said, were killed at the observatory; three of whom were also of the first rank.

About eleven o'clock, our two friends left us, and took the precaution to desire, that our guard-boat might attend them, till they had passed the Discovery, lest they should again be fired upon, which might alarm their countrymen on shore, and expose them to the danger of being discovered. This request was complied with; and we had the satisfaction to find, that they got safe and undiscovered to land.

During the remainder of this night, we heard the same loud howling and lamentations, as in the preceding one. Early on Tuesday morning, we received another visit from Koah. It must be confessed we were a little piqued to find, that, notwithstanding the most evident marks of treachery in his conduct, and the positive testimony of our friends the priests, he should still be permitted to carry on the same farce, and to make us at least appear to be the dupes of his hypocrisy. Indeed our situation was become extremely awkward and unpromising; none of the purposes for which this pacific course of proceeding had been adopted, having hitherto been in the least forwarded by it. No satisfactory answer whatever had been given to our demands; we did not seem to be at all advanced towards a reconciliation with the islanders; they still kept in force on the shore, as if determined to resist any attempts we might make to land; and yet the attempt was become absolutely necessary, as the completing our supply of water would not admit of any longer delay.

However it must be observed, in justice to the conduct of Capt. Clerke, that it was very probable, from the great numbers of the natives, and from the resolution with which they seemed to expect us, an attack could not have been made without some danger; and that the loss of a very few men might have been severely felt by us, during the remaining course of our voyage. Whereas the delaying the execution of our threats, though, on the one hand, it lessened their opinion of our prowess, had the effect of causing them to disperse, on the other. For, this day, about noon, finding us persist in our inactivity, great bodies of them, after blowing their conchs, and using every mode of defiance, marched off, over the hills, and never appeared afterward. Those, however, who remained, were not the less daring and insolent. One man had the audacity to come within musquet-shot, a-head of the ship; and, after flinging several stones at us, he waved Capt. Cook's hat over his head, whilst his countrymen on shore were exulting and encouraging his boldness. Our people were all in a flame at this insult, and coming in a body on the quarter-deck, begged they might no longer be obliged to put up with these repeated provocations; and requested Mr. King to obtain permission for them, from Capt. Clerke, to avail themselves of the first fair occasion of revenging the death of their commander. On his acquainting him with what was passing, he gave orders for some great guns to be

fired at the natives on shore; and promised the crew, that if they should meet with any molestation at the watering-place, the next day, they should then be left at liberty to chastise them.

It is somewhat remarkable, that, before we could bring our guns to bear, the islanders had suspected our intentions, from the stir they saw in the ship, and had retired behind their houses and walls. We were therefore obliged to fire, in some measure, at random; notwithstanding which, our shot produced all the effects that could have been desired. For, soon after, we saw Koah paddling towards us, with extreme haste, and, on his arrival, we learned, that some people had been killed, and amongst the rest, Maiha-maiha, a principal chief, and a near relation of the king.

Soon after the arrival of Koah, two boys swam off from the Morai towards the ships, having each a long spear in his hand; and after they had approached pretty near, they began to chant a song, in a very solemn manner; the subject of which, from their often mentioning the word Orono, and pointing to the village where Capt. Cook was killed, we concluded to be the late calamitous disaster. Having sung in a plaintive strain for about twelve or fifteen minutes, during the whole of which time they remained in the water, they went on board the Discovery, and delivered their spears; and, after making a short stay, returned on shore. Who sent them, or what was the object of this ceremony, we were never able to learn.

At night, the usual precautions were taken for the security of the ships; and as soon as it was dark, our two friends, who had visited us the night before, came off again. They assured us, that though the effects of our great guns this afternoon, had terrified the chiefs exceedingly, they had by no means laid aside their hostile intentions, and advised us to be on our guard.

On Wednesday morning, the boats of both ships were sent ashore for water; and the Discovery was warped close to the beach, in order to cover that service. We soon found, that the intelligence which the priests had sent us, was not without foundation; and that the natives were resolved to take every opportunity of annoying us, when it could be done without much risk.

Throughout all this group of islands, the villages, for the most part, are situated near the sea; and the adjacent ground is inclosed with stone walls, about three feet high. These, we at first imagined, were intended for the division of property; but we now discovered, that they served, and probably were principally designed, for a defence against invasion. They consist of loose stones, and the inhabitants are very dexterous in shifting them, with great quickness, to such situations, as the direction of the attack may require. In the sides of the mountain, which hangs over the bay, they have also little holes, or caves, of considerable depth, the entrance of which is secured by a fence of the same kind. From behind both these defences the natives kept perpetually harassing our waterers with stones; nor could the small force we had on shore, with the advantage of musquets, compel them to retreat.

In this exposed situation, our people were so taken up in attending to their own safety, that they employed the whole forenoon in filling only one ton of water. As it was therefore impossible to perform this service, till their assailants were driven to a greater distance, the Discovery was ordered to dislodge them, with her great guns; which being effected by a few discharges the men landed without molestation. However, the natives soon after made their appearance again, in their usual mode of attack; and it was now found absolutely necessary to burn down some straggling houses, near the wall, behind which they had taken shelter. In executing these orders, we are sorry to add, that our people were hurried into acts of unnecessary cruelty and devastation. Something ought certainly to be allowed to their resentment of the repeated insults, and contemptuous behaviour, of the islanders, and to the natural desire of revenging the loss of their commander. But, at the same time, their conduct served strongly

strongly to evince, that the utmost precaution is necessary in trusting, though but for a moment, the discretionary use of arms in the hands of private seamen, or soldiers, on such occasions. The rigour of discipline, and the habits of obedience, by which their force is kept directed to its proper objects, lead them naturally enough to conceive, that whatever they have the power, they have also the right to do. Actual disobedience being almost the only crime for which they are accustomed to expect punishment, they learn to consider it as the only measure of right and wrong; and hence are apt to conclude, that what they can do with impunity, they may do with justice and honour. So that the feelings of humanity, which are inseparable from us all, and that generosity towards an unrelenting enemy, which, at other times, is the distinguishing mark of brave men, become but weak restraints to the exercise of violence, when opposed to the desire they naturally have of shewing their own independence and power.

We have already mentioned, that orders had been given to burn only a few straggling huts, which afforded shelter to the natives. We were therefore a good deal surprized to see the whole village on fire; and before a boat, that was sent to stop the progress of the mischief, could reach the shore, the houses of our old and constant friends, the priests, were all in flames. We cannot enough lament the illness, that confined Mr. King on board this day. The priests had always been under his protection; and, unluckily, the officers who were then on duty, having been seldom on shore at the Morai, were not much acquainted with the circumstances of the place. Had he been present himself, he might probably have been the means of saving their little society from destruction.

Several of the natives were shot, in making their escape from the flames; and our people cut off the heads of two of them, and brought them on board. The fate of one poor islander was much lamented by us all. As he was coming to the well for water, he was shot at by one of the marines. The ball struck his calibash, which he immediately threw from him and fled. He was pursued into one of the caves, and no lion could have defended his den with greater courage and fierceness; till at last, after having kept two of our people at bay for a considerable time, he expired, covered with wounds. It was this accident, that first brought us acquainted with the use of these caverns.

At this time, an elderly man was taken prisoner, bound, and sent on board in the same boat with the heads of his two countrymen. We never saw horror so strongly pictured, as in the face of this man, nor so violent a transition to extravagant joy, as when he was untied, and told he might go away in safety. He shewed us he did not want gratitude, as he frequently afterwards returned with presents of provisions; and also did us other services.

Soon after the village was destroyed, we saw, coming down the hill, a man, attended by fifteen or twenty boys, holding pieces of white cloth, green boughs, plantains, &c. in their hands. We knew not how it happened, that this peaceful embassy, as soon as they were within reach, received the fire of a party of our men. This, however, did not stop them. They continued their procession, and the officer on duty came up, in time, to prevent a second discharge. As they approached nearer, it was found to be our much-esteemed friend Kaireekca, who had fled on our first setting fire to the village, and had now returned, and desired to be sent on board the Resolution.

When he arrived, we found him exceedingly grave and thoughtful. We endeavoured to make him understand the necessity we were under of setting fire to the village, by which his house, and those of his brethren, were unintentionally consumed. He expostulated a little with us on our want of friendship, and on our ingratitude. And, indeed, it was not till now, that we learnt the whole extent of the injury we had done them. He told us, that, relying on the promises we

had made them, and on the assurances they had afterwards received from the men, who had brought us the remains of Captain Cook, they had not removed their effects back into the country, with the rest of the inhabitants, but had put every thing that was valuable of their own, as well as what they had collected from us, into a house close to the Morai, where they had the mortification to see it all set on fire by ourselves.

On coming on board, he had seen the heads of his countrymen lying on the deck, at which he was exceedingly shocked, and desired, with great earnestness, that they might be thrown over-board. This request Capt. Clerke instantly ordered to be complied with.

In the evening, the watering party returned on board, having met with no farther interruption. We passed a gloomy night; the cries and lamentations we heard on shore being far more dreadful than ever. Our only consolation was, the hope that we should have no occasion, in future, for a repetition of such severities.

It is very extraordinary, that amidst all these disturbances, the women of the island, who were on board, never offered to leave us, nor discovered the smallest apprehensions either for themselves or their friends ashore. So entirely unconcerned did they appear, that some of them, who were on deck when the town was in flames, seemed to admire the sight, and frequently cried out, that it was maitai, or very fine.

On Thursday morning, Koah came off as usual to the ships. As there existed no longer any necessity for keeping terms with him, Mr. King was allowed to have his own way. When he approached towards the side of the ship, singing his song, and offering a hog, and some plantains, we ordered him to keep off, cautioning him never to appear again without Capt. Cook's bones, lest his life should pay the forfeit of his frequent breach of promise. He did not appear much mortified with this reception, but went immediately on shore, and joined a party of his countrymen, who were pelting the waterers with stones. The body of the young man, who had been killed the day before, was found this morning, lying at the entrance of the cave; and some of our people went, and threw a mat over it. Soon after which they saw some men carrying him off on their shoulders, and could hear them singing, as they marched, a mournful song.

The natives, being at last convinced, that it was not the want of ability to punish them, which had hitherto made us tolerate their provocations, desisted from giving us any farther molestation; and, in the evening, a chief called Eappo, who had seldom visited us, but whom we knew to be a man of the very first consequence, came with presents from Terrecoboo to sue for peace. These presents were received, and he was dismissed with the same answer which had before been given, that, until the remains of Capt. Cook should be restored, no peace would be granted. We learned from this person, that the flesh of all the bodies of our people, together with the bones of the trunks, had been burnt; that the limb bones of the marines had been divided amongst the inferior chiefs; and that those of Capt. Cook had been disposed of in the following manner: the head, to a great chief, called Kahooopeon; the hair to Maia-maia; and the legs, thighs, and arms to Terrecoboo. After it was dark, many of the inhabitants came off with roots and other vegetables; and we also received two large presents of the same articles from Kaireekca.

Friday the 19th of February, was chiefly taken up in sending and receiving the messages which passed between Capt. Clerke and Terrecoboo. Eappo was very pressing, that one of our officers should go on shore; and, in the mean time, offered to remain as an hostage on board. This request, however, it was not thought proper to comply with; and he left us with a promise of bringing the bones the next day. At the beach, the waterers did not meet with the least opposition from the natives; who, notwithstanding our

cautious behaviour, came amongst us again, without the smallest appearance of diffidence or apprehension.

Between ten and eleven o'clock of the 20th, we saw a great number of people descending the hill, which is over the beach, in a kind of procession, each man carrying a sugar-cane or two on his shoulders, and bread-fruit, taro, and plantains in his hand. They were preceded by two drummers; who, when they came to the water-side, sat down by a white flag, and began to beat their drums, while those who had followed them, advanced, one by one; and, having deposited the presents they had brought, retired in the same order. Soon after, Eappo came in sight, in his long feathered cloak, bearing something with great solemnity in his hands; and having placed himself on a rock, he made signs for a boat to be sent him.

Captain Clerke, conjecturing that he had brought the bones of Captain Cook, which proved to be the fact, went himself in the pinnace to receive them; and ordered me to attend him in the cutter. When we arrived at the beach, Eappo came into the pinnace, and delivered to the captain the bones wrapped up in a large quantity of fine new cloth, and covered with a spotted cloak of black and white feathers. He afterward attended us to the Resolution; but could not be prevailed upon to go on board; probably not choosing, from a sense of decency, to be present at the opening of the bundle. We found in it both the hands of Captain Cook entire, which were well known from a remarkable scar on one of them, that divided the thumb from the fore finger, the whole length of the metacarpal bone; the skull, but with the scalp separated from it, and the bones that form the face wanting; the scalp, with the hair upon it cut short, and the ears adhering to it; the bones of both arms, with the skin of the fore-arms hanging to them; the thigh and leg-bones joined together, but without the feet. The ligaments of the joints were entire; and the whole bore evident marks of having been in the fire, except the hands, which had the flesh left upon them, and were cut in several places, and crammed with salt, apparently with an intention of preserving them. The scalp had a cut in the back part of it, but the skull was free from any fracture. The lower jaw and feet, which were wanting, Eappo told us, had been seized by different chiefs, and that Terreeoboo was using every means to recover them.

The next morning, Feb. 21, Eappo, and the king's son, came on board, and brought with them the remaining bones of Captain Cook; the barrels of his gun, his shoes, and some other trifles that belonged to him. Eappo took great pains to convince us, that Terreeoboo, Maïha-maïha, and himself were most heartily desirous of peace; that they had given us the most convincing proof of it in their power; and that they had been prevented from giving it sooner by the other chiefs, many of whom were still our enemies. He lamented, with the greatest sorrow, the death of six chiefs we had killed, some of whom, he said, were amongst our best friends. The cutter, he told us, was taken away by Parcea's people; very probably in revenge for the blow that had been given him; and that it had been broken up the next day. The arms of the marines, which we had also demanded, he assured us, had been carried off by the common people, and were irrecoverable; the bones of the chief alone having been preserved, as belonging to Terreeoboo and the Erees.

Nothing now remained, but to perform the last offices to our great and unfortunate commander. Eappo was dismissed with orders to taboo all the bay; and, in the afternoon, the bones having been put into a coffin, and the service read over them, they were committed to the deep with the usual military honours. What our feelings were on this occasion, we must leave the world to conceive; those who were present know, that it is not in our power to express them.

During the forenoon of Feb. 22, not a canoe was seen paddling in the bay; the taboo, which Eappo had laid on it the day before, at our request, not being yet

taken off. At length Eappo came off to us. We assured him, that we were now entirely satisfied; and that, as the Orono was buried, all remembrance of what had passed was buried with him. We afterward desired him to take off the taboo, and to make it known, that the people might bring their provisions as usual. The ships were soon surrounded with canoes, and many of the chiefs came on board, expressing great sorrow at what had happened, and their satisfaction at our reconciliation. Several of our friends, who did not visit us, sent presents of large hogs, and other provisions. Amongst the rest came the old treacherous Koah, but who was refused admittance.

As we had now every thing ready for sea, Captain Clerke imagining, that, if the news of our proceedings should reach the islands to leeward before us, it might have a bad effect, gave orders to unmoor. About eight in the evening we dismissed all the natives; and Eappo, and the friendly Kaïreekeea, took an affectionate leave of us. We immediately weighed, and stood out of the bay. The natives were collected on the shore in great numbers; and, as we passed along, received our last farewells with every mark of affection and good will.

As a navigator, Capt. Cook's services were perhaps not less splendid than important and meritorious. The method which he discovered, and so successfully pursued, of preserving the health of seamen, forms a new era in the œconomy of navigation, and will transmit his name to future ages, amongst the friends and benefactors of mankind.

Those who are conversant in naval history, need not be told, at how dear a rate the advantages, which have been sought, through the medium of long voyages at sea, have always been purchased. That dreadful disorder which is peculiar to this service, and whose ravages have marked the tracks of discoverers with circumstances almost too shocking to relate, must, without exercising an unwarrantable tyranny over the lives of our seamen, have proved an insuperable obstacle to the prosecution of such enterprizes. It was reserved for Captain Cook to shew the world, by repeated trials, that voyages might be protracted to the unusual length of three or even four years, in unknown regions, and under every change and rigour of climate, not only without affecting the health, but even without diminishing the probability of life, in the smallest degree. The method he pursued has been fully explained by himself, in a paper which was read before the Royal Society, in the year 1776, by Sir Godfrey Capley, who had a gold medal adjudged to him on that occasion; and whatever improvements the experience of his third voyage has suggested, will be mentioned in this work in their proper places.

With respect to his professional abilities, we shall now leave them to the judgement of those who are best acquainted with the nature of the services in which he was engaged. They will readily acknowledge, that to have conducted three expeditions of so much danger and difficulty, of so unusual a length, and in such a variety of situation, with uniform and invariable success, must have required not only a thorough and accurate knowledge of his business, but a powerful and comprehensive genius, fruitful in resources, and equally ready in the application of whatever the higher and inferior calls of the service required.

We cannot here forbear noticing a medal, which has been executed by Mr. Pingo, for the Royal Society, to perpetuate the memory of a man, whose merit is far superior to panegyric, but which medal, we are sorry to say, does not convey a striking likeness of Capt. Cook, though in some respects elegantly designed.

On one side of this medal is given a relief of Captain Cook, with this inscription, JAC. COOK, OCEANI INVESTIGATOR ACERRIMUS: immediately under the head is expressed in smaller characters, Reg. Soc. Lond. Socio suo. On the reverse appears an erect figure of BRITANNIA standing upon a plain: the left arm rests upon an hieroglyphic pillar: her right arm is projected over

over a globe, and contains a symbol, expressive of the celebrated circumnavigator's enterprising genius. The inscription round the reverse is, *NIL INTENTATUM NOSTRI LIQUERE*; and under the figure of Britannia, *Auspiciis Georgii III.*

A few were struck off in gold, which are said to be disposed of as follows:

One to his Britannic majesty, under whose auspices Captain Cook proceeded on his discoveries.

One to the king of France, for his great courtesy in giving a specific charge to his naval commanders to forbear an hostile conduct to either of the ships under Captain Cook's command, and to afford every assistance in their power in case they fell in with them.

One to the Empress of Russia, for her great hospitality to Captain Cook, when he touched at Kamtschaka.

One to Mrs. Cook, the captain's relict.

One to be deposited in the British Museum, and one to remain in the college of the Royal Society.

There were also several silver ones distributed amongst the Lords of the Admiralty, and other distinguished personages.

The principal objects of these voyages will be best explained by inserting the following extracts from Captain Cook's instructions, for undertaking and performing his last voyage, dated Admiralty Office, July 6, 1776, and signed by Lord Sandwich, and two other commissioners.

"YOU are hereby required and directed, his majesty having a good opinion of your abilities, to take the command of the Resolution and Discovery, and proceed upon a voyage of finding out a northern passage by sea, from the Pacific to the Atlantic Ocean.

"On your arrival at the Cape of Good Hope, you are to refresh the sloop's companies.

"You are, if possible, to leave the Cape of Good Hope by the end of October, or the beginning of November next, and proceed to the southward in search of some islands said to have been lately seen by the French, in the latitude of 48 deg. south, and about the meridian of Mauritius. In case you find those islands, you are to examine them thoroughly for a good harbour; and upon discovering one, make the necessary observations to facilitate the finding it again; as a good port, in that situation, may hereafter prove very useful. You are then to proceed to Otaheite, or the Society Isles (touching at New Zealand in your way thither, if you should judge it necessary and convenient) and taking care to arrive there time enough to admit of your giving the sloop's companies the refreshment they may stand in need of.

"Upon your arrival at Otaheite, or the Society Isles, you are to land Omiah at such of them as he may choose, and to leave him there.

You are to distribute among the chiefs of those islands such part of the presents with which you have been supplied, as you shall judge proper, reserving the remainder to distribute among the natives of the countries you may discover in the northern hemisphere. You are to leave those islands in the beginning of February, or sooner if you shall judge it necessary, and then proceed in as direct a course as you can to the coast of New Albion, endeavouring to fall in with it in the latitude of 45 deg. north.

"Upon your arrival on the coast of New Albion, you are to put into the first convenient port to recruit your wood and water, and procure refreshments, and then to proceed northward along the coast, as far as the latitude of 65 deg. or farther, where we could wish you to arrive in the month of June next. When you get that length, you are very carefully to search for, and to explore, such rivers or inlets as may appear to be of a considerable extent, and pointing towards Hudson's or Baffin's Bays; and if, from your own observations, or from any information you may receive from the natives (who, there is reason to believe, are the same race of people, and speak the same language, of which you are furnished with a vocabulary, as the Esquimaux)

there shall appear to be a certainty, or even a probability, of a water passage into the afore-mentioned bays, or either of them, you are, in such case, to use your utmost endeavours to pass through with one or both of the sloops, unless you shall be of opinion that the passage may be effected with more certainty, or with greater probability, by smaller vessels; in which case you are to set up the frames of one or both the small vessels with which you are provided, and, when they are put together, and are properly fitted, stored, and victualled, you are to dispatch one or both of them, under the care of proper officers, men, and boats, in order to attempt the said passage. But, nevertheless, if you shall find it more eligible to pursue other measures than those above pointed out, in order to make a discovery of the before-mentioned passage, (if any such there be) you are at liberty, and we leave it to your discretion, to pursue such measures accordingly.

"In case you shall be satisfied that there is no passage through to the above-mentioned bays, sufficient for the purposes of navigation, you are, at the proper season of the year, to repair to the port of St. Peter and St. Paul in Kamtschaka, or wherever else you shall judge more proper, in order to refresh your people and pass the Winter; and, in the Spring of the ensuing year 1778, to proceed from thence to the northward, as far as, in your prudence, you may think proper, in further search of a north east, or north west passage, from the Pacific Ocean into the Atlantic Ocean, or the North Sea: and if, from your own observation, or information, there shall appear to be a probability of such passage, you are to proceed as above directed: and, having discovered such passage, or failed in the attempt, make the best of your way back to England, by such route as you may think best for the improvement of geography and navigation.

"At whatever places you may touch in the course of your voyage, where accurate observations have not already been made, you are, as far as your time will allow, very carefully to observe the true situation of such places, both in latitude and longitude; the variation of the needle; bearings of head-lands; height, direction, and course of the tides and currents; depths and soundings of the sea; shoals, rocks, &c. and also to survey, make charts, and take views of such bays, harbours, and different parts of the coast, and to make such notations thereon, as may be useful either to navigation or commerce. You are also carefully to observe the nature of the soil, and the produce thereof. You are likewise to observe the genius, temper, disposition, and number of the inhabitants, where you find any; and to endeavour to cultivate a friendship with them.

"You are also, with the consent of the natives, to take possession, in the name of the king of Great Britain, of convenient situations in such countries as you may discover, that have not already been discovered or visited by any other European power; and to distribute among the inhabitants such things as will remain as traces and testimonies of your having been there; but if you find the countries so discovered are uninhabited, you are to take possession of them for his majesty, by setting up proper marks and inscriptions.

"You are, by all opportunities, to send to our secretary accounts of your proceedings; and upon your arrival in England, you are immediately to repair to this office, in order to lay before us a full account of the whole course of your voyage; taking care, before you leave the sloop, to demand from the officers and petty officers, the log-books and journals they may have kept, and to seal them up for our inspection; and enjoining them, and the whole crew, not to divulge where they have been, until they shall have permission so to do: and you are to direct Captain Clerke to do the same, with respect to the officers, petty officers, and crew of the Discovery."

Having here given the most faithful account we have been able to collect, both from our own observations, and the relations of others, of the life, death, public

public services, and character of this excellent commander, we shall now leave his memory to the gratitude and admiration of posterity.

Thus having trespassed on the public indulgence by digressing to relate particulars of a very interesting nature, and which will, notwithstanding, be highly acceptable to all our numerous readers, we shall resume the narrative of the first voyage, which will be followed with the second and third voyages in their regular order.

ON the 13th of July, 1769, after leaving the island of Otaheite, we continued our course, with clear weather and a gentle breeze; and were informed by Tupia, that four islands which he called Huaheine, Ulietea, Otaha, and Bolabola, were at the distance of about one or two days sail; and that hogs, fowls, and other refreshments, very scarce on board, were to be got there in great abundance. He also mentioned an island to the northward, which he called Tethuroa. It is situated north half west eight leagues distant from the northern extremity of Otaheite. It was a small low island, but as Tupia said, without any settled inhabitants. On the 15th we made but little way, on account of the calms which succeeded the light breezes. Tupia often prayed to his god Tane for a wind, and boasted of his success, which indeed he took care to insure, by never applying to Tane, till he saw a breeze so near, that he knew it must reach the ship before his prayer was concluded.

On the 16th we founded near the north-west part of the island of Huaheine, but found no bottom at 70 fathoms. Several canoes put off; but the Indians seemed fearful of coming near the bark till the sight of Tupia removed their apprehensions. They then came along side, and the king of the island, with his queen, came on board. They seemed surprized at whatever was shewn them, but made no enquires after any thing but what was offered to their notice. After some time they became more familiar; and the king, whose name was Oree, as a token of amity, proposed exchanging names with Capt. Cook, which was readily accepted. We found the people here nearly similar to those of Otaheite in almost every particular; but if Tupia might be credited, they are not like them addicted to thieving. Having anchored in a small but convenient harbour, on the west side of the island, (called by the natives Owparré) we went on shore with Mr. Banks, and some other gentlemen, accompanied by the king and Tupia. The moment we landed Tupia uncovered himself as low as the waist, and desired Mr. Monkhouse to follow his example. Being seated he now began a speech, or prayer, which lasted about twenty minutes; the king, who stood opposite to him, answering in what seemed set replies. During this harangue, Tupia delivered, at different times, a handkerchief, a black silk neckcloth, some plantains, and beads, as presents to their Eatua, or deity; and in return for our Eatua, we received a hog, some young plantains, and two bunches of feathers, all which were carried on board. These ceremonies were considered as a kind of ratification of a treaty between us and the king of Huaheine.

On the 17th we went again on shore, and made an excursion into the country, the productions of which greatly resembled those of Otaheite; the rocks and clay seemed, indeed, more burnt: the boat houses were curious and remarkable large. The level part of the country affords the most beautiful landscapes that the imagination can possibly form an idea of. The soil is exceedingly fertile, and the shore is lined with fruit trees of different kinds, particularly the cocoa-nut; however, in some places there were salt swamps and lagoons, which produced neither trees nor plants.

On the 18th we went again on shore, and Tupia being engaged with his friends, we took with us Taiyora, his boy. Mr. Banks proposed taking a more perfect view of a kind of chest, or ark, which he had before observed. The lid of this ark was neatly sewed on, and

thatched in a peculiar manner with palm-nut leaves. It was placed on two poles, and supported by small carved arches of wood. These poles served to remove it from one place to another, in the manner of our sedan-chairs. We remarked, that this chest was of a form resembling the ark of the Lord among the Jews; but it is still more remarkable, that enquiring of Tupia's servant what it was called, he told us Ewharre no Eatua, the House of God; though he could give no account of its meaning or use. Our trade with the natives went on slowly; we got however eleven pigs, and were not without hopes of obtaining more the next morning.

On the 19th we offered them some hatchets, for which we procured three very large hogs. As we intended to sail in the afternoon, king Oree, and others of the natives came on board to take their leave. Captain Cook presented to Oree a small pewter plate, stamped with this inscription, "His Britannic Majesty's ship Endeavour, Captain Cook, commander, 16 July, 1769." We gave him also some medals, or counters, resembling our English coin, and other trifles, which he promised to keep in order to remember us. The island of Huaheine lies in 16 deg. 43 min. south latitude, and 150 deg. 52 min. west longitude; about 30 leagues distant from Otaheite, and is twenty miles in circumference. Its productions are a month forwarder than those of the last mentioned island, as we found by several of the fruits, &c. Mr. Banks collected only a few new plants, but found a species of the scorpion which he had not before seen. The inhabitants are very lazy, but are stouter and larger made than those of Otaheite; the women very fair, and we thought them handsome. Both sexes seemed to be less timid, and less curious. They made no enquiries when on board the ship, and, when we fired a gun, though apparently frightened, yet they did not fall down, as our friends at Otaheite constantly did when we came among them; but it is to be considered, that the former had never experienced its power of dispensing death. We now made sail for the island of Ulietea, distant seven or eight leagues from Huaheine.

On the 20th, by the direction of Tupia, we anchored in a bay, formed by a reef, on the north side of the island. Two canoes soon came off from the shore, and the natives brought with them two small hogs, which they exchanged for some nails and beads. The captain, Mr. Banks, and other gentlemen now went on shore, accompanied by Tupia, who introduced them with the same kind of ceremonies that had taken place on their landing at Huaheine; after which Captain Cook took possession of this and the three neighbouring islands, Huaheine, Otaha, and Bolabola, in the name of his Britannic majesty. We then walked to a large Morai, called by the natives Tabodeboatea, which we found different from the sepulchral monuments of Otaheite, being composed of four walls, about eight or nine feet high, and built of large coral stones, surrounding a court of about 30 feet square. At a small distance we found an altar, or ewhatta, whereupon lay the last oblation, or sacrifice, a hog about eighty pounds weight, which had been offered whole, and very nicely roasted. We also saw four or five Ewharre-no-eatua, or houses of God, to which carriage poles were fitted. From hence we proceeded to a long house, where among rolls of cloth, we saw the model of a canoe, about three feet long, to which were fastened eight human jaw-bones: we concluded they were trophies of war; but Tupia affirmed they were the jaw-bones of the natives of this island. Night now advanced with quick paces, but Mr. Banks and the Doctor continued their walk along the shore, and saw another Ewharre-no-eatua, also a tree of the fig kind, the trunk of which, (the nature whereof has been already described) was forty-two paces in circumference.

On the 21st the master was sent to inspect the southern part of the island, and a lieutenant was dispatched in the yawl to sound the harbour where the Endeavour lay. While the Captain went in the pinnace to take a view

view of that part of the island which lay to the northward. Mr. Banks and the gentlemen were again on shore, trading with the natives, and searching after the productions and curiosities of the country. They discovered, however, not one particular worthy of notice.

The hazy weather and brisk gales prevented us from getting under sail, till the 24th, when we put to sea, and steered northward within the reef, towards an opening, at the distance of about five or six leagues, in effecting which we were in great danger of striking on a rock, the man who sounded, crying out on a sudden "Two fathoms," which could not but alarm us greatly; but either the master was mistaken, or the ship went along the edge of a coral rock, many of which in the neighbourhood of these islands are as steep as a wall.

The bay where the Endeavour lay at anchor, called Oopoa, is capacious enough to hold a great number of shipping, and secured from the sea by a reef of rocks. Its situation is off the easternmost part of the island. The provisions consist of cocoa-nuts, yams, plantains, and a few hogs and fowls. The country round about the place where we landed was not so plentiful as at Otaheite or Huahine. The southernmost opening in the reef, or channel into the harbour, by which we entered, is little more than a cable's length wide; it lies off the easternmost point of the island, and may be found by a small woody island, which lies to the south-east of it, called Oatara; north-west from which are two other islets called Opururu and Tamou. Between these is the channel through which we went out of the harbour, and it is a full quarter of a mile wide.

On the 25th we were within a league or two of the island of Ootaha; but could not get near enough to land, the wind having proved contrary. In the morning, Mr. Banks and Dr. Solander went in the long-boat with the master, in order to found a harbour on the east side of the island, which they found safe and convenient. We then went on shore and purchased a large quantity of plantains, and some hogs and fowls. The produce of this island was much the same with that of Ulietea, but it seemed to be more barren. We received the same compliment from the Indians here, as was usual for them to pay their own kings, which was by uncovering their shoulders, and wrapping their cloths round their bodies. We made sail to the northward, and at eight o'clock on the 29th, we were under the high peaks of Bolabola. We found the island inaccessible in this part, and likewise that it was impossible to weather the south end of it till late at night. On the 30th, we discovered an island which Tupia called Maurua, but said it was small, surrounded by a reef, and without any commodious harbour, but inhabited, and yielded nearly the same produce as the adjacent islands. In the middle is a high round hill which may be seen at eleven or twelve leagues distance. In the afternoon, finding ourselves to windward of some harbour that lay on the west side of Ulietea, we intended to put into one of them, in order to stop a leak which had sprung in the powder-room, and to take in some additional ballast. The wind being right against us, we plied on and off till the afternoon of the first of August, when we came to an anchor in the entrance of the channel, which led into one of the harbours.

On Wednesday the 2d, in the morning, when the tide turned, we came into a proper place for mooring in 28 fathoms. Many of the natives came off, and brought hogs, fowls, and plantains, which were purchased upon very moderate terms. Mr. Banks and Dr. Solander went on shore, and spent the day very agreeably; the natives shewing them great respect: being conducted to the houses of the chief people, they found those who had ran hastily before them, standing on each side of a long mat spread upon the ground, and the family sitting at the farther end of it. In one house they observed some very young girls dressed in the neatest manner, who kept their places waiting for the strangers to accost them; these girls were the most beautiful the gentlemen had ever seen. One of them, about seven or eight years old, was dressed in a red gown, and her

No. 5.

head was decorated with a great quantity of plaited hair; this ornament is called Tamou, and is held in great estimation among them. She was sitting at the upper end of one of their long mats, on which none of the people present presumed to set a foot; and her head was reclined on the arm of a decent looking woman, who appeared to be her nurse; when Mr. Banks and Dr. Solander approached her, she stretched out her hand to receive some beads, which they presented to her, with an air of such dignity and gracefulness, as would have done honour to the first princess in Europe.

In one of the houses we were entertained with a dance, different from any we had seen before. The performer put upon his head a large piece of wicker-work, about four feet long, of a cylindrical form, covered with feathers, and edged round with shark's teeth. With this head-dress, which is called a Whou, he began to dance with a slow motion, frequently moving his head, so as to describe a circle with the top of his wicker cap, and sometimes throwing it so near the faces of the by-standers as to make them jump back: this they considered as an excellent piece of humour, and it always produced a hearty laugh, when practised upon any of the English gentlemen.

On Thursday the 3d, as Mr. Banks and the doctor were going along the shore to the northward, with a design to purchase stock, they met with a company of dancers, who retarded the progress of their excursion. The company was composed of six men and two women dancers, with three drums. They were informed that these dancers were some of the principal people of the island, and though they were an itinerant troop, they did not, like the strolling parties of Otaheite, receive any gratuity from the by-standers. The women wore a considerable quantity of tamou, or plaited hair, ornamented with flowers of the cape-jessamine, which were stuck in with taste, and made an elegant head-dress. The women's necks, breasts and arms, were naked; the other parts of their bodies were covered with black cloth, which was fastened close round them, and by the side of each breast, next the arms was a small plume of black feathers, worn like a nosegay. Thus apparelled, they advanced sideways, keeping time with great exactness to the drums, which beat quick and loud; soon after they began to shake themselves in a very whimsical manner, and put their bodies into a variety of strange postures, sometimes sitting down, and at others falling with their faces to the ground, and resting on their knees and elbows, moving their fingers at the same time with a quickness scarcely to be credited. The chief dexterity, however, of the dances, as well as the amusement of the spectators, consisted in the lasciviousness of their attitudes and gestures. Between the dances of the women a kind of dramatic interlude was performed by the men, consisting of dialogue as well as dancing; but for want of a sufficient knowledge of their language, we could not learn the subject of this interlude.

Mr. Banks, Dr. Solander and some other gentlemen, were present at a more regular dramatic entertainment the next day. The performers, who were all men, were divided into two parties, one dressed in brown, and the other in white, by way of distinction. Tupia being present, informed them that the party in brown, acted the parts of a master and his servants, and the party in white, a gang of thieves; the master having produced a basket of meat, which he gave in charge to his servants: which party, exhibited a variety of expedients, in endeavouring to steal this basket, and the brown as many in preventing the accomplishment of their design. After some time had been spent in this manner, those to whom the basket was intrusted, laying themselves down on the ground round it, pretended to fall asleep; the other party availing themselves of this opportunity, stole gently upon them, and carried off their booty; the servants awaking soon after, discovered their loss, but they made no search after the basket, and began to dance with as much alacrity as before.

On Saturday the 5th, some hogs and fowls, and several

vera

A View in the Island of HUAHINE, with Representations of the Ewharrano Fatua, or House of God.

veral large pieces of cloth, many of them being fifty or sixty yards in length, together with a quantity of plantains and cocoa-nuts, were sent to Captain Cook, as a present from the Earee Rahie of the island of Bolabola, accompanied with a message, importing that he was then on the island, and intended waiting on the captain.

On the 6th, the king of Bolabola did not visit us agreeable to his promise, his absence, however, was not in the least regretted, as he sent three young women to demand something in return for his present. After dinner, we set out to pay the king a visit on shore, since he did not think proper to come on board. As this man was the Earee Rahie of the Bolabola man, who had conquered this, and were the dread of all the neighbouring islands, we were greatly disappointed instead of finding a vigorous enterprising young chief, to see a poor feeble old dotard, half blind, and sinking under the weight of age and infirmities. He received us without either that state or ceremony which we had hitherto met with among the other chiefs.

On Wednesday the 9th, having stopped a leak, and taken on board a fresh stock of provisions, we sailed out of the harbour. Though we were several leagues distant from the island of Bolabola, Tupia earnestly intreated Captain Cook, that a shot might be fired towards it; which, to gratify him, the captain complied with. This was supposed to have been intended by Tupia as a mark of his resentment against the inhabitants of that place, as they had formerly taken from him large possessions which he held in the island of Ulietea, of which island Tupia was a native, and a subordinate chief, but was driven out by these warriors. We had great plenty of provisions, as well of hogs, as of vegetables, during the time we continued in the neighbourhood of these islands, so that we were not obliged to use any considerable quantity of the ships provisions, and we had flattered ourselves, that the fowls and hogs would have supplied us with fresh provisions during the course of our voyage to the southward, but in this we were unhappily disappointed, for as the hogs could not be brought to eat any European grain, or any provender whatever, that the ship afforded, we were reduced to the disagreeable necessity of killing them immediately on leaving those islands; and the fowls all died of a disease in their heads, with which they were seized soon after they had been carried on board. Being detained longer at Ulietea in repairing the ship than we expected, we did not go on shore at Bolabola; but after giving the general name of the Society Islands, to the islands of Huaheine, Ulietea, Bolabola, Otaha, and Maurua, which lie between the latitude of 16 deg. 10 min. and 18 deg. 55 min. south, we pursued our course, standing southwardly for an island, to which we were directed by Tupia, at above 100 leagues distant. This we discovered on Sunday the 13th, and were informed by him, that it was called Obiterca.

On the 14th we stood in for land, and saw several of the inhabitants coming along the shore. One of the lieutenants was dispatched in the pinnace to sound for anchorage, and to obtain what intelligence could be got from the natives concerning any land, that might be farther to the south. Mr. Banks, Dr. Solander, and Tupia, went with the lieutenant in the boat. When they approached the shore, they observed, that the Indians were armed with long lances. A number of them were soon drawn together on the beach, and two jumped into the water, endeavouring to gain the boat; but the soon left them and some others that had made the same attempt, far enough behind her. Having doubled the point where they intended to land, they opened a large bay, and saw another party of the natives standing at the end of it, armed like those whom they had seen before. Preparations were then made for landing, on which a canoe full of Indians came off towards them. Observing this, Tupia received orders to acquaint them that the English did not intend to offer them violence, but meant to traffic with them for nails, which were produced. Thus informed they

came along-side the boat, and took some nails that were given them, being seemingly well pleased with the present. Yet a few minutes after, several of these people boarded the boat, designing to drag her on shore; but some musquets being discharged over their heads they leaped into the sea, and having reached the canoe, put back with all possible expedition, joining their countrymen who stood ready to receive them. The boat immediately pursued the fugitives, but the crew finding the surf extremely violent, did not venture to land there, but coasted along shore to try if they could not find a more convenient place. Soon after the canoe got on shore, a man opposite the boat flourished his weapon, calling out at the same time with a shrill voice, which was a mark of defiance, as Tupia explained it to the English. Not being able to find a proper landing-place they returned, with an intention to attempt it when the canoe went on shore; whereupon another warrior repeated the defiance: his appearance was more formidable than that of the other; he had a high cap on made of the tail feathers of a bird, and his body was painted with various colours. When he thought fit to retire, a grave man came forward, who asked Tupia several questions, relating to the place from whence the vessel came, as, Who were the persons on board? Whither they were bound? &c. After this it was proposed that the people in the boat should go on shore and trade with them if they would lay aside their weapons; but the latter would not agree to this, unless the English would do the like. As this proposal was by no means an equal one, when it was considered that the hazard must for many reasons be greater to the boat's crew than the Indians, and as perfidy was dreaded, it was not complied with. Besides, since neither the bay which the Endeavour entered, nor any other part of the island furnished good harbour or anchorage, it was resolved not to attempt landing any more, but to sail from hence to the southward.

The natives are very tall, well proportioned, and have long hair, which, like the inhabitants of the other islands, they tie in a bunch on the top of their heads, they are likewise tataowed in different parts of their bodies, but not on their posteriors. The isle does not shoot up into high peaks like the others that they visited, but is more level and uniform, and divided into small hillocks, some of which are covered with groves of trees. However, none of those bearing the bread fruit were seen, and not many cocoa-trees, but a great number of those called Etoa, were seen on the sea coast of this island. Both the nature of their cloth, and their manner of wearing it differed in many respects from what had been observed in the progress of our voyage. All the garments that these people wore, were dyed yellow, and painted with a variety of colours on the outside. One piece formed their whole habit, having a hole in it through which they put their heads. This reached as far as their knees, and was tied close round their bodies with a kind of yellowish sail. Some of them also wore caps of the same kind, as we have already mentioned, and others bound round their heads a piece of cloth which resembled a turban.

On the 15th we sailed from this island with a fine breeze; but on the 16th it was hazy, and we bore away for what resembled several high peaks of land. The weather clearing up, we were convinced of our mistake, and resumed our course accordingly. We saw a comet on the 30th, about four o'clock, which was then about 60 deg. above the horizon. Land was discovered at west by north on Thursday the 7th of October, and in the morning of the 8th, we came to an anchor opposite the mouth of a small river, not above half a league from the coast.

Captain Cook, Mr. Banks, Dr. Solander, and some other gentlemen, having left the pinnace at the mouth of the river, proceeded a little farther up, when we landed, leaving the yawl to the care of some of our boys, and went up to a few small houses in the neighbourhood. Some of the natives that had concealed themselves in the neighbourhood took advantage of our absence from the boat, and rushed out, advancing and brand-

An Exact Representation of a Dance in Otaheite.

brandishing their long wooden lances. On this our boys dropped down the stream. The cockswain of the pinnace then fired a musketoon over their heads, but it did not prevent them from following the boat, in consequence of which he levelled his piece, and shot one of them dead on the spot. Struck with astonishment at the death of their companion, the others remained motionless for some time, but as soon as they recovered their fright, retreated to the woods with the utmost precipitation. The report of the gun brought the advanced party back to the boats, and both the pinnace and yawl returned immediately to the ship.

On the 9th, a great number of the natives were seen near the place where the gentlemen in the yawl had landed the preceding evening, and the greatest part of them appeared to be unarmed. The long boat, pinnace, and yawl, being manned with marines and sailors, Capt. Cook, with the rest of the gentlemen, and Tupia, went on shore, and landed on the opposite side of the river, over against a spot where several Indians were sitting on the ground. These immediately started up, and began to handle their weapons, each producing either a long pike, or a kind of truncheon made of stone with a string through the handle of it, which they twisted round their wrists. Tupia was directed to speak to them in his language; and we were agreeably surprized to find that he was well understood, the natives speaking in his language, though in a different dialect. Their intentions at first appeared to be very hostile, brandishing their weapons in the usual threatening manner; upon which a musket was fired at some distance from them: the ball happened to fall into the water, at which they appeared rather terrified, and desisted from their menaces. Having now drawn up the marines, we advanced nearer to the side of the river. Tupia, again speaking, informed them of our desire to traffic with them for provisions: to this they consented, provided we would go over to them to the other side of the river. The proposal was agreed to, upon condition that the natives would quit their weapons; but the most solemn assurances of friendship could not prevail with them to make such a concession. Not thinking it prudent therefore to cross the river, we, in our turn, intreated the Indians to come over to us, and after some time prevailed on one of them so to do. He was presently followed by several others. They did not appear to value the beads and iron which we offered in the way of barter, but proposed to exchange their weapons for ours; which being objected to, they endeavoured several times to snatch our arms from us, but being on our guard, from the information given us by Tupia that they were still our enemies, their attempts were repeatedly frustrated; and Tupia, by our direction gave them to understand, that any further offers of violence would be punished with instant death. One of them, nevertheless, had the audacity to snatch Mr. Green's dagger when his back was turned to them, and retiring a few paces, flourished it over his head; but his temerity cost him his life; for Mr. Monkhouse fired a musquet loaded with ball, and he instantly dropped. Soon after, though not before we had discharged our pieces loaded with small shot only, they retreated slowly up the country, and we returned to our boats.

The behaviour of the Indians, added to our want of fresh water, induced Capt. Cook to continue his voyage round the bay, with a hope of getting some of the natives aboard, that by civil usage he might convey through them a favourable idea of us to their countrymen, and thereby settle a good correspondence with them. An event occurred which, though attended with disagreeable circumstances, promised to facilitate this design. Two canoes appeared, making towards land, and Capt. Cook proposed intercepting them with our boats. One of them got clear off, but the Indians in the other, finding it impossible to escape, began to attack our people in the boats with their paddles. This compelled the Endeavour's people to fire upon them, when four of the Indians were killed, and the other three, who were young men, jumped into the water,

and endeavoured to swim to shore; they were, however, taken up, and conveyed on board. At first they discovered all the signs of fear and terror, thinking they should be killed; but Tupia, by repeated assurances of friendship, removed their apprehensions, and they afterwards eat heartily of the ship's provisions. Having retired to rest in the evening, they slept very quietly for some hours, but about midnight, their fears returning, they appeared in great agitation, frequently making loud and dismal groans. Again the kind caresses and friendly promises of Tupia operated so effectually, that they became calm, and sung a song, which at the dead of night had a pleasing effect. The next morning, after they were dressed according to the mode of their own country, and were ornamented with necklaces and bracelets, preparations were made for sending them to their countrymen, at which they expressed great satisfaction; but finding the boat approaching Capt. Cook's first landing place, they intimated that the inhabitants were foes, and that after killing their enemies, they always eat them. The captain, nevertheless, judged it expedient to land near the same spot, which he accordingly did with Mr. Banks, Doctor Solander, and Tupia, resolving at the same time to protect the youths from any injury that might be offered them. These had scarcely departed on their return to their friends, when two large parties of Indians advanced hastily towards them, upon which they again flew to us for protection. When the Indians drew near, one of the boys discovered his uncle among them, and a conversation ensued across the river, in which the boy gave a just account of our hospitality, and took great pains to display his finery. A short time after this conversation, the uncle swam across the river, bringing with him a green bough, a token of friendship, which we received as such, and several presents were made him. Notwithstanding the presence of this relation, all three of the boys, by their own desire, returned to the ship, but as the captain intended to sail the next morning, he sent them ashore in the evening, though much against their inclination. The names of these boys were Toahowrange, Koikerange, and Maragovete. They informed us of a particular kind of deer upon the island, and that there were likewise tars, capers, romara, yams; a kind of long pepper, bald coote, and black birds.

On the 11th at six o'clock in the morning, we weighed, and set sail, in hopes of finding a better anchoring place, Capt. Cook having given the bay (called by the natives Toancora) the name of Poverty Bay; and the south-west point he called young Nick's Head, on account of its first having been perceived by a lad on board, named Nicholas Young. In the afternoon we were becalmed; and several canoes full of Indians came off from the shore, who received many presents, and afterwards bartered even their cloaths, and some of their paddles, so eager were they to be possessed of European commodities. A single tree formed the bottom of their canoes, and the upper part consisted of two planks sewed together; these were painted red, representing many uncommon figures, and very curiously wrought. The Indians were armed with bludgeons, made of wood, and of the bone of a large animal: they called them Patoo-Patoo; and they were well contrived for close fighting.

Having finished their traffic, they set off in such a hurry, that they forgot three of their companions, who remained on board all night. These testified their fears and apprehensions, notwithstanding Tupia took great pains to convince them they were in no danger; and about seven o'clock the next morning a canoe came off, with four Indians on board. It was at first with difficulty the Indians in the ship could prevail on those in the canoe to come near them, and not till after the former had assured them, that the English did not eat men. The chief came on board, whose face was tattooed, with a remarkable patoo in his hand, and in this canoe the three Indians left the ship. Capt. Cook gave the name of Cape Table to a point of land about seven leagues to the south of Poverty Bay: its figure greatly

greatly resembling a table, and the island, called by the natives Teahowry, he named Portland Island, it being very similar to that of the same name in the British Channel. It is joined to the main by a chain of rocks near a mile in length, partly above water. There are several shoals, called shambles, about three miles to the north-east of Portland, one of which the Endeavour narrowly escaped; there is, however, a passage between them with twenty fathom water. Some parts of Portland Island, as well as the main, were cultivated; and pumice stone in great quantities lying along the shore, within the bay, indicated that there was a volcano in the island. High palings upon the ridges of hills were also visible in two places, which were judged to be designed for religious purposes.

On the 12th several Indians came off in a canoe; they were disfigured in a strange manner, danced and sang, and at times appeared to be peaceably inclined, but at others to menace hostilities. Notwithstanding Tupia strongly invited them to come on board, none of them would quit the canoe. Whilst the Endeavour was getting clear of the shambles, five canoes full of Indians came off, and seemed to threaten the people on board, by brandishing their lances, and other hostile gestures. A four-pounder, loaded with grape-shot, was therefore ordered to be fired, but not pointed at them. This had the desired effect, and made them drop a-stern. Two more canoes came off whilst the Endeavour lay at anchor, but the Indians on board behaved very peaceably and quiet, and received several presents, but would not come on board.

On Friday the 13th in the morning, we made for an inlet, but finding it not sheltered, stood out again; and were chased by a canoe filled with Indians, but the Endeavour out-failed them. She pursued her course round the bay, but did not find an opening. The next morning we had a view of the inland country. It was mountainous, and covered with snow in the interior parts, but the land towards the sea was flat and uncultivated, and in many places there were groves of high trees. Nine canoes full of Indians came from the shore, and five of them, after having consulted together, pursued the Endeavour, apparently with a hostile design. Tupia was desired to acquaint them that immediate destruction would ensue if they persevered in their attempts; but words had no influence, and a four-pounder, with grape-shot was fired, to give them some notion of the arms of their opponents. They were terrified at this kind of reasoning, and paddled away faster than they came. Tupia then hailed the fugitives and acquainted them that if they came in a peaceable manner, and left their arms behind, no annoyance would be offered them; one of the canoes submitting to the terms, came along-side the ship, and received many presents; but the other canoes returning, and persisting in the same menacing behaviour, interrupted this friendly intercourse.

On the 15th we were visited by some fishing-boats, the people in which, conducted themselves in an amicable manner. Though the fish which they had on board had been caught so long that they were not eatable, Capt. Cook purchased them merely for the sake of promoting a traffic with the natives. In the afternoon a canoe with a number of armed Indians came up, and one of them, who was remarkably cloathed, with a black skin, found means to defraud the captain of a piece of red baize, under pretence of bartering the skin he had on for it. As soon as he had got the baize into his possession, instead of giving the skin in return, agreeable to his bargain, he rolled them up together, and ordered the canoe to put off from the ship, turning a deaf ear to the repeated remonstrance of the captain against his unjust behaviour. After a short time this canoe, together with the fishing boats which had put off at the same time, came back to the ship, and trade was again begun. During this second traffic with the Indians, one of them unexpectedly seized Tupia's little boy Taiyota, and pulling him into his canoe, instantly put off, and paddled away with the utmost speed; several muskets were immediately discharged at the people in

the canoe, and one of them receiving a wound, they all let go the boy, who before was held down in the bottom of the canoe. Taiyota taking the advantage of their consternation, immediately jumped into the sea, and swam back towards the Endeavour; he was taken on board without receiving any harm; but his strength was so much exhausted with the weight of his cloaths, that it was with great difficulty he reached the ship. In consequence of this attempt to carry off Taiyota, Capt. Cook called the cape off which it happened, Cape Kidnappers, lying in latitude 39 deg. 43 min. south, and longitude 182 deg. 24 min. west, and is very distinguishable by the high cliffs and white rocks that surrounded it. The distance of this cape from Portland Island is about 13 leagues, and it forms the south point of a bay which was denominated Hawke's Bay, in honour of Admiral Hawke.

Taiyoto, having recovered from his fright, produced a fish and informed Tupia that he intended to offer it to his Eatua or God, in gratitude for his happy escape; this being approved of by the other Indian, the fish was cast into the sea. Capt. Cook now passed by a small island which was supposed to be inhabited only by fishermen, as it seemed to be barren, and Bare Island was the name given to it, and to a head-land in latitude 40 deg. 34 min. south, and longitude 182 deg. 55 min. west, because the Endeavour turned, he gave the name of Cape Turnagain. It was never certainly known whether New Zealand was an island before this vessel touched there: on this account, the lords of the admiralty had instructed Capt. Cook to sail along the coasts as far as 40 degrees south, and if the land extended farther, to return to the northward again. It was for this reason that the captain altered his course, when he arrived at the cape above-mentioned: the wind having likewise veered about to the south, he returned, sailing along the coast nearly in his former track. Between this and Cape Kidnappers Bay, the land is unequal, and somewhat resembles our downs and small villages, and many inhabitants were observed. The ship came abreast of a peninsula, in Portland Island, named Tera-kako, on Wednesday the 19th. At this time a canoe with five Indians came up to the vessel. There were two chiefs among them, who came on board, and staid all night. One of these was a very comely person, and had an open and agreeable countenance. They were extremely grateful for the presents which they received and displayed no small degree of curiosity. They would not eat or drink, but the servants devoured the victuals set before them with a most voracious appetite.

We gave the name of Gable End Foreland to a remarkable head-land, which we passed on the 19th. Three canoes appeared here, and one Indian came on board to whom we gave small presents before he withdrew.

Many of these Indians wore pieces of green-stone round their necks which were transparent, and resembled an emerald. These being examined, appeared to be a species of the nephritic stone. Several pieces of it were procured by Mr. Banks, and it appeared that this furnished the islanders with their principal ornaments. The form of some of their faces was agreeable; their noses were rather prominent than flat. Their dialect was not so guttural as that of others, and their language nearly resembled that of Otaheite.

On Friday the 20th we anchored in a bay two leagues to the north of the Foreland. To this bay we were invited by the natives in canoes, who behaved very amicably, and pointed to a place where they said we should find plenty of fresh water. We determined here to get some knowledge of the country, though the harbour was not so good a shelter from the weather as we expected. Two chiefs, whom we saw in the canoes, came on board, they were dressed in jackets, the one ornamented with tufts of red feathers, the other with dogs-skin. We presented to them linen and some spike nails, but they did not value the last so much as the inhabitants of the other islands. The rest of the Indians traded with us without the least imposition, and we directed Tupia to acquaint them of our views in coming thither; and promise,

promise, that they should receive no injury, if they offered none to us. In the afternoon the chiefs returned; and towards the evening we went on shore, accompanied by the Captain, Dr. Solander, and Mr. Banks. We were courteously received by the inhabitants, who did not appear in numerous bodies, and in other instances were scrupulously attentive not to give offence. We made them several small presents, and in this agreeable tour round the bay, we had the pleasure of finding two streams of fresh water. We remained on shore all night, and the next day Mr. Banks and Dr. Solander discovered several birds, among which were quails and large pigeons. Many stages for drying fish were observed near where we landed, and some houses with fences. We saw dogs with pointed ears, and very ugly. Sweet potatoes, like those which grow in America were found. The cloth plant grew spontaneous. In the neighbouring valleys the lands were laid out in regular plantations; and in the bay we caught plenty of crabs, cray-fish, and horse-mackerel, larger than those upon the English coasts. The low lands were planted with cocoes; the hollows with gourds; but as to the woods they were almost impassable, on account of the number of fiddle-jacks which grew there. We went into several of the houses belonging to the natives, and met with a very civil reception; and, without the least reserve, they shewed us whatever we desired to see. At times we found them at their meals, which our presence never interrupted. At this season fish constituted their chief food; with which they eat, instead of bread, roots of a kind of fern; these when roasted upon a fire are sweet and clammy; in taste not disagreeable, though rather unpleasant from the number of their fibres. They have doubtless in other seasons of the year an abundance of excellent vegetables.

The women of this place paint their faces with a mixture of red ore and oil, which, as they are very plain, renders them in appearance more homely. This kind of daubing being generally wet upon their cheeks and foreheads, was easily transferred to those who saluted them, as was frequently visible upon the noses of our people. The young ones, who were complete coquets, wore a petticoat, under which was a girdle, made of the blades of grass strongly perfumed, to which was pendant a small bunch of the leaves of some fragrant plant. The faces of the men were not in general painted; but they were daubed with dry red ore from head to foot, their apparel not excepted. Though in personal cleanliness they were not equal to our friends at Otaheite, yet in some particulars they surpassed them; for their dwellings were furnished with privies, and they had dunghills upon which their offals and filth were deposited. Among the females chastity was lightly esteemed. They resorted frequently to the watering place, where they freely bestowed every favour that was requested. An officer meeting with an elderly woman, he accompanied her to her house, and having presented her with some cloth and beads, a young girl was singled out, with whom he was given to understand he might retire. Soon after an elderly man, with two women came in as visitors, who with much formality saluted the whole company, after the custom of the place, which is by gently joining the tips of their noses together. On his return, which was on Saturday the 21st, he was furnished with a guide, who whenever they came to a brook or rivulet took him on his back to prevent his being wet. Many of the natives were curiously tattooed, an old man in particular, was marked on the breast with curious figures. One of them had an axe made of the green stone, which we could not purchase, though sundry things were offered in exchange. These Indians at night dance in a very uncouth manner, with antic gestures, lolling out their tongues and making strange grimaces. In their dances old men as well as the young ones are capital performers.

In the evening, Mr. Banks, being apprehensive that we might be left on shore after it was dark, applied to the Indians for one of their canoes to convey us on board the ship. This they granted with an obliging

manner. We were eight in number, and not being used to a vessel that required a nice balance, we overfet her in the surf. No one however was drowned, but it was concluded, to prevent a similar accident, that half our number should go at one time. Mr. Banks, Dr. Solander, Tupia, and Taiyota, were the first party who embarked again, and arrived safe at the ship, as did the remainder of our company, all not a little pleased with the good nature of our Indian friends, who cheerfully contributed their assistance, upon our second trip. During our stay on shore, several of them went out in their canoes and trafficked with the ships company. At first they preferred the cloth of Otaheite to that of Europe, but in the course of a day it decreased in its value five hundred per cent. These people expressed strong marks of astonishment when shewn the bark and her apparatus. This bay, which we now determined to quit, the natives call Tegadoo, and it is situated in 38 deg. 10 min. south latitude.

On the 22d in the evening, being Sunday, we weighed anchor and put to sea, but the wind being contrary we stood for another bay a little to the south, called by the natives Tolaga, in order to complete our wood and water, and to extend our correspondence with the natives. In this bay we came to an anchor, in about eleven fathom water, with a good sandy bottom, the north point of the bay bearing north by east, and the south point south east. We found a watering-place in a small cove a little within the south-point of the bay, which bore south by east, distant about a mile. Several canoes with Indians on board, trafficked with us very fairly for glass bottles.

On Monday the 23d in the afternoon, we went on shore accompanied by Mr. Banks, Dr. Solander, and the captain. We examined and found the water extremely good; also plenty of wood; and the natives shewed us as much civility as those from whom we had lately departed. At this watering-place we set up an astronomical quadrant, and took several solar and lunar observations. In the morning of the 24th, Mr. Gore and the marines were sent on shore to guard the people employed in cutting wood and filling the casks with water. Capt. Cook, Mr. Banks, and the doctor also went on shore: the latter were employed in collecting plants. In our walks through the vales we saw many houses uninhabited, the natives residing chiefly in sheds, on the ridges of the hills, which are very steep. In a valley between two very high hills, we saw a curious rock that formed a large arch, opposite the sea. This cavern was in length about seventy feet, in breadth thirty, and near fifty in height, commanding a view of the bay and hills on the other side, which had a very pleasing effect. Indeed the whole country about the bay is agreeable beyond description, and, if properly cultivated, would be a most fertile spot. The hills are clothed with beautiful flowering shrubs, intermixed with a number of tall, stately palms, which perfume the air, making it perfectly odoriferous. Mr. Banks and the doctor, among other trees that yielded a fine transparent gum, discovered the cabbage tree, the produce whereof when boiled, was very good. We met with various kinds of edible herbage in great abundance, and many trees that produced fruit fit to eat. The plant from which the cloth is made, is a kind of Hemerocallis; its leaves afford a strong glossy flax, equally adapted to cloathing, and making of ropes. Sweet potatoes and plantains are cultivated near the houses.

On our return we met an old man who entertained us with the military exercises of the natives, which are performed with the Patoo-Patoo and the lance. The former has been already mentioned, and is used as a battle axe: the latter is eighteen or twenty feet in length, made of extreme hard wood, and sharpened at each end. A stake was substituted for a supposed enemy. The old warrior first attacked him with his lance, advancing with a most furious aspect. Having pierced him, the patoo-patoo was used to demolish his head, at which he struck with a force which would at one blow have split any man's skull: from whence we concluded

concluded no quarter was given by these people to their foes in time of action.

The natives in this part are not very numerous. They are tolerably well shaped, but lean and tall. Their faces resemble those of the Europeans. Their noses are aquiline, their eyes dark coloured, their hair black, which is tied upon the top of their heads, and the mens beards are of a moderate length. Their tataowing is done very curiously, in various figures, which makes their skin resemble carving; it is confined to the principal men, the females and servants using only red paint, with which they daub their faces, that otherwise would not be disagreeable. Their cloth is white, glossy, and very even; it is worn principally by the men, though it is wrought by the women, who, indeed, are condemned to all drudgery and labour.

On the 25th, we set up the armourers forge on shore for necessary uses, and got our wood and water without the least molestation from the natives, with whom we exchanged glass bottles and beads for different sorts of fish. Mr. Banks and Dr. Solander went again in search of plants, Tupia, who was with them, engaged in a conversation with one of the priests, and they seemed to agree in their opinions upon the subject of religion. Tupia, in the course of this conference, enquired whether the report of their eating men was founded in truth, to which the priest answered, it was, but that they eat none but declared foes, after they were killed in war. This idea so savage and barbarous, proved, however, that they carried their resentment even beyond death.

On the 27th, Capt. Cook and Dr. Solander went to inspect the bay, when the doctor was not a little surprised to find the natives in the possession of a boy's top, which they knew how to spin by whipping it, and he purchased it out of curiosity. Mr. Banks was during this time employed in attaining the summit of a steep hill, that had previously engaged their attention, and near it he found many inhabited houses. There were two rows of poles about fourteen or fifteen feet high, covered over with sticks, which made an avenue of about five feet in width, extending near a hundred yards down the hill, in an irregular line: the intent of this erection was not discovered. When the gentlemen met at the watering place, the Indians sang their war song, which was a strange medley of shouting, sighing, and grimace, at which the women assisted. The next day Capt. Cook and other gentlemen went upon the island at the entrance of the bay, and met with a canoe that was 67 feet in length, six in breadth, and four in height; her bottom, which was sharp, consisted of three trunks of trees, and the sides and head were curiously carved.

We also came to a large unfinished house. The posts which supported it were ornamented with carvings, that did not appear to be done upon the spot, and as the inhabitants seem to set great value upon works of this kind, future navigators might find their advantage in carrying such articles to trade with. Though the posts of this house were judged to be brought here, the people seemed to have a taste for carving, as their boats, paddles, and tops of walking sticks evince. Their favourite figure is a volute or spiral, which is sometimes single, double, and triple, and is done with great exactness, though the only instruments we saw were an axe made of stone, and a chissel. Their taste, however, is extremely whimsical and extravagant, scarcely ever imitating nature. Their huts are built under trees, their form is an oblong square: the door low on the side, and the windows are at the ends; reeds covered with thatch compose the walls; the beams of the caves, which come to the ground, are covered with thatch; most of the houses had been deserted, through fear of the English, upon their landing. There are many beautiful parrots, and great numbers of birds of different kinds, particularly one whose note resembles the European black-bird; but here is no ground fowl or poultry, nor any quadrupedes, except rats and dogs, and these were not numerous. The dogs are considered as delicate food, and their skins serve for

ornaments to their apparel. There is a great variety of fish in the bay, shell and cray fish are very plentiful, some of the latter weigh near 12 pounds.

Sunday, October the 29th, we set sail from this bay. It is situate in latitude 38 deg. 22 min. south, four leagues to the north of Gable End Foreland; there are two high rocks at the entrance of the bay, which form a cove very good for procuring wood and water. There is a high rocky island off the north point of the bay, which affords good anchorage, having a fine sandy bottom, and from seven to thirteen fathom water, and is likewise sheltered from all but the north-east wind. We obtained nothing here in trade but some sweet potatoes, and a little fish. This is a very hilly country, though it presents the eye with an agreeable verdure, various woods and many small plantations. Mr. Banks found a great number of trees in the woods, quite unknown to Europeans, the fire wood resembled the maple-tree, and produced a gum of whitish colour; other trees yielded a gum of a deep yellow green. The only roots were yams and sweet potatoes, though the soil appears very proper for producing every species of vegetables.

On Monday the 30th, sailing to the northward, we fell in with a small island about a mile distant from the north-east point of the main, and this being the most eastern part of it, the captain named it East Cape, and the island East Island, it was but small, and appeared barren. The cape is in latitude, 37 deg. 42 min. 30 sec. south. There are many small bays from Tolaga Bay to East Cape. Having doubled the cape, many villages presented themselves to view, and the adjacent land appeared cultivated. In the evening of the 30th, Lieutenant Hicks discovered a bay to which his name was given. Next morning, about nine, several canoes came off from shore with a number of armed men, who appeared to have hostile intentions. Before these had reached the ship, another canoe, larger than any that had yet been seen, full of armed Indians, came off, and made towards the Endeavour with great expedition. The captain now judging it expedient to prevent, if possible, their attacking him, ordered a gun to be fired over their heads. This not producing the desired effect, another gun was fired with ball, which threw them into such consternation that they immediately returned much faster than they came. This precipitate retreat, induced the captain to give the cape, off which it happened, the name of Cape Runaway; it lies in latitude 37 deg. 32 min. south, and longitude 181 deg. 48 min. west.

On the 31st, we found that the land, which during this day's run appeared like an island, was one, and we named the same White Island.

On the 1st of November, at day-break, not less than between 40 and 50 canoes were seen, several of which came off as before, threatening to attack the English. One of their chiefs flourished his pike, and made several harangues, seeming to bid defiance to those on board the vessel. At last, after repeated invitations, they came close along-side; but instead of shewing a disposition to trade, the haranguing chief uttered a sentence, and took up a stone which he threw against the ship, and immediately after they seized their arms. They were informed by Tupia, of the dreadful consequences of commencing hostilities; but this admonition they seemed little to regard. A piece of cloth, however, happening to attract their eyes, they began to be more mild and reasonable. A quantity of cray fish, muscels, and conger eels was now purchased. No fraud was attempted by this company of Indians, but some others that came after them, took goods from the vessel without making proper returns. As one of them that had rendered himself remarkable for these practices, and seemed proud of his skill in them, was putting off with his canoe, a musquet was fired over his head, which circumstance produced good order for the present. Yet when these savages began to traffic with the sailors, they renewed their frauds; and one of them was bold enough to seize some linen that was hung to dry, and run away with it. In order to induce him to

return,

return, a musquet was first fired over his head, but this not answering the end, he was shot in the back with small shot, yet he still persevered in his design. This being perceived by his countrymen, they dropped a-stern, and set up the song of defiance. In consequence of their behaviour, though they made no preparations to attack the vessel, the captain gave orders to fire a four pounder, which passed over them; but its effect on the water terrified them so much, that they retreated with precipitation to the shore.

In the afternoon, about two o'clock, we discovered a pretty high island to the westward. Some time after perceiving other rocks and islands in the same quarter, but not being able to weather them before night came on, we bore up between them and the main land. In the evening a double canoe, built after the same fashion as those of Otaheite, came up, when Tupia entered into a friendly conversation with the Indians, and was told that the island, close to which we lay, was called Mowtohora. It was but a few miles from the main land, pretty high, but of no great extent. We imagined the disposition of the Indians, from their talk with Tupia, to be in our favour, but, when it was dark they began their usual salute, by pouring a volley of stones into the ship and then retreated. South-west by west of this island, upon the main land, and in the center of a large plain, is a high circular mountain, to which we gave the name of Mount Edgecombe. It is very conspicuous, and is seated in latitude 37 deg. 59 min. longitude 193 deg. 7 min.

The next morning, being the 2nd, a number of canoes appeared, and one, which proved to be the same that had pelted us the night before, came up. After conversing with Tupia, and behaving peaceably about an hour, they complimented us with another volley of stones. We returned the salute by firing a musket, which made them instantly take to their paddles. Between ten and eleven we failed between a low flat island and the main land. The last appeared to be of a moderate height, but level, full of plantations and villages. The villages were upon the high land next the sea, more extensive than any we had seen, and surrounded by a ditch, and a bank with rails on the top of it. There were some inclosures that resembled forts, and the whole had the appearance of places calculated for defence.

On the 3d, we passed the night near a small island, which Capt. Cook named the Mayor; and at seven in the morning, distant from hence about six leagues, we discovered a cluster of small islands, which we called the Court of Aldermen. These were twelve miles from the main, between which were other small islands, mostly barren, but very high. The aspect of the main land was now much changed, the soil appearing to be barren, and the country very thinly inhabited. The chief who governed the district from Cape Turnagain to this coast was named Teratu. In the afternoon three canoes, built differently from those already mentioned, came along-side the Endeavour. They were formed of the trunks of whole trees, rendered hollow by burning; but they were not carved, nor in any manner ornamented. We now failed towards an inlet that had been discovered, and having anchored in seven fathom water, the ship was soon surrounded by a number of canoes, and the people on board them did not seem disposed for some time to commit any acts of hostility. A bird being shot by one of our crew, some Indians, without shewing any surprise brought it on board; and for their civility the captain gave them a piece of cloth. But this favour operated upon them in a different manner than was expected; for when it was dark, they began a song of defiance, and endeavoured to carry off the buoy of the anchor; and notwithstanding some musquets were fired at them, they seemed rather to be irritated than frightened. They even threatened to return the next morning; but on Sunday night eleven of them were to be seen, and these retired when they found the ship's crew were upon their guard.

On the 4th at day break no less than twelve canoes

made their appearance, containing near two hundred men, armed with spears, lances, and stones, who seemed determined to attack the ship, and would have boarded her, had they known on what quarter they could best have made their attack. While they were paddling round her, which kept the crew upon the watch in the rain, Tupia, at the request of the captain, used a number of dissuasive arguments, to prevent their carrying their apparent designs into execution; but we could only pacify them by the fire of our muskets: they then laid aside their hostile intentions, and began to trade; yet they could not refrain from their fraudulent practices; for after they had fairly bartered two of their weapons, they would not deliver up a third, for which they had received cloth, and only laughed at those who demanded an equivalent. The offender was wounded with small shot; but his countrymen took not the least notice of him, and continued to trade without any discomposure. When another canoe was struck for their mal-practices, the natives behaved in the same manner; but if a round was fired over or near them, they all paddled away. Thus we found, that theft and chicane, were as prevalent among the inhabitants of New Zealand, as those of Otaheite. In searching for an anchoring place, the captain saw a fortified village upon a high point, and having fixed upon a proper spot, he returned; upon which we weighed, run in nearer to the shore, and cast anchor upon a sandy bottom, in four fathom and a half water. The south point of the bay bore due east, distant one mile, and a river which the boats can enter at low water fourth south-east, distant a mile and an half.

On the 5th, in the morning, the Indians came off to the ship again, who behaved much better than they had done the preceding day. An old man in particular named Tojava, testified his prudence and honesty, to whom and a friend with him, the captain presented some nails, and two pieces of English cloth. Tojava informed us, that they were often visited by free-booters from the north, who stripped them of all they could lay their hands on, and at times made captives of their wives and children; and that being ignorant who the English were upon their first arrival, the natives had been much alarmed, but were now satisfied of their good intentions. He added, that for their security against those plunderers, their houses were built contiguous to the tops of the rocks, where they could better defend themselves. Probably their poverty and misery may be ascribed to the ravages of those who frequently strip them of every necessary of life. Having dispatched the long-boat and pinnace into the bay to haul and dredge for fish, but with little success, the Indians on the banks testified their friendship by every possible means. They brought us great quantities of fish dressed and dried, which though indifferent, we purchased, that trade might not be discouraged. They also supplied us with wood and good water. While we were out with our guns, the people who staid by the boats saw two of the natives fight. The battle was begun with their lances; but some old men taking these away, they were obliged to decide the quarrel, like Englishmen, with their fists. For some time they boxed with great vigour and perseverance, but at length they all retired behind a little hill, so that our people were prevented from seeing the issue of the combat. At this time the Endeavour being very foul, she was heeled, and her bottom scrubbed in the bay.

On the 8th, we were visited by several canoes, in one of which was Tojava, who, desiring two canoes, hastened back again to the shore, apprehending they were freebooters; but finding his mistake, he soon returned; and the Indians supplied us with as much excellent fish as served the whole ship's company. This day a variety of plants were collected by Mr. Banks and Doctor Solander, who had never observed any of the kind before. They staid on shore till near dark, when they observed how the natives disposed of themselves during the night. They had no shelter but a few shrubs. The men lay nearest the sea in a semicircular form; and the women and children most distant from

t. They had no king whose sovereignty they acknowledged, a circumstance not to be paralleled on any other parts of the coast.

Early in the morning of the 9th the Indians brought in their canoes a prodigious quantity of mackrel, of which one sort were exactly the same with those caught in England. They sold them at a low rate, and they were not less welcome to us on that account. These canoes were succeeded by others equally loaded with the same sort of fish; and the cargoes purchased were so great, that every one of the ships company who could get salt, cured as many as would serve him for a month's provision. The Indians frequently resort to the bay in parties to gather shell-fish, of which it affords an incredible plenty. Indeed wherever we went, whether on the hills, or through the vales, in the woods or on the plains, we saw many waggon loads of shells in heaps, some of which appeared fresh, others very old.

This being a very clear day, Mr. Green, the astronomer, landed with other gentlemen to observe the transit of Mercury. The observation of the ingress was made by Mr. Green alone, and Capt. Cook took the sun's altitude to ascertain the time. While the observation was making, a canoe, with various commodities on board, came along-side the ship; and Mr. Gore, the officer who had then the command, being desirous of encouraging them to traffic, produced a piece of Otaheitean cloth, of more value than any they had yet seen, which was immediately seized by one of the Indians, who obstinately refused either to return it, or give any thing in exchange: he paid dearly however for his temerity, being shot dead on the spot. The death of this young Indian alarmed all the rest; they fled with great precipitancy, and, for the present, could not be induced to renew their traffick with the English. But when the Indians on shore had heard the particulars related by Tojava, who greatly condemned the conduct of the deceased, they seemed to think that he had merited his fate. His name was Otirreonooe. This transaction happened, as has been mentioned, whilst the observation was making of the transit of Mercury, when the weather was so favourable, that the whole transit was viewed, without a cloud intervening. The transit commenced seven hours, 20 min. 58 sec. By Mr. Green's observation the internal contact was at 12 hours, eight min. 57 sec. the external at 12 hours nine min. 55 sec. the latitude 30 deg. 48 min. five sec. In consequence of this observation having been made here, this bay was called Mercury Bay.

On the 10th, Mr. Banks, Dr. Solander, and the captain went in boats to inspect a large river that runs into the bay. They found it broader some miles within than at the mouth, and intersected into a number of streams, by several small islands, which were covered with trees. On the east side of the river, the gentlemen shot some shags, which proved very good eating. The shore abounded with fish of various kinds, such as cockles, clams, and oysters; and here were also ducks, shags, and curlews, with other wild fowl in great plenty. At the mouth of the river there was good anchorage in five fathom water. The gentlemen were received with great hospitality by the inhabitants of a little village on the east side of the river. There are there the remains of a fort called Eppah, on a peninsula that projects into the river, and it was calculated for defending a small number against a greater force. From the remains, it nevertheless seemed to have been taken and partly destroyed. The Indians sup before sun-set, when they eat fish and birds baked or roasted; they roast them upon a stick, stuck in the ground near the fire, and bake them in the manner the dog was baked, which the gentlemen eat at George's Island. A female mourner was present at one of their suppers; she was seated upon the ground, and wept incessantly, at the same time repeating some sentences in a doleful manner, but which Tupia could not explain; at the termination of each period she cut herself with a shell upon her breast, her hands, or her face; notwithstanding this bloody spectacle greatly affected the gentlemen present, yet all the Indians who

fat by her, except one, were quite unmoved. The gentlemen saw some, who from the depth of their scars must, upon these occasions, have wounded themselves more violently.

Great plenty of oysters were procured from a bed which had been discovered, and they proved exceedingly good. Next day the ship was visited by two canoes, with unknown Indians; after some invitation they came on board, and they all trafficked without any fraud. Two fortified villages being deserted, the Captain, with Mr. Banks, and Dr. Solander, went to examine them. The smallest was romantically situated upon a rock, which was arched; this village did not consist of above five or six houses, fenced round. There was but one path, which was very narrow, that conducted to it. The gentlemen were invited by the inhabitants to pay them a visit, but not having time to spare, took another route, after having made presents to the females. A body of men, women, and children now approached the gentlemen; these proved to be the inhabitants of another town, which they proposed visiting. They gave many testimonies of their friendly dispositions; among others they uttered the word Heromai, which according to Tupia's interpretation, implied peace, and appeared much satisfied, when informed the gentlemen intended visiting their habitations. Their town was named Wharretouwa. It is seated on a point of land over the sea, on the north side of the bay, and was pailed round, and defended by a double ditch. Within the ditch a stage is erected for defending the place in case of an attack; near this stage, quantities of darts and stones are deposited that they may always be in readiness to repel the assailants. There is another stage to command the path that leads to the town; and there were some out-works. The place seemed calculated to hold out a considerable time against an enemy armed with no other weapons than those of the Indians. It appeared however deficient in water for holding out a siege. Instead of bread, they had fern root, which was here in great plenty, with dried fish. Very little of the land was cultivated, and sweet potatoes and yams were the only vegetables to be found. There are two rocks near the fort of this fortification, both separated from the main land; they are very small, nevertheless they are not without dwelling-houses and little fortifications. In their engagements, these Indians throw stones with their hands, being destitute of a sling, and those and lances are their only missile weapons; they have, besides the patoo-patoo, already described, a staff about five feet in length and another shorter. We sailed from this bay, after having taken possession of it in the name of the king of Great Britain, on the 15th of November. Tojava, who visited us in his canoe just before our departure, said, he should prepare to retire to his fort as soon as the English were gone, as the relations of Otirreonooe had threatened to take his life, as a forfeit for that of the deceased, Tojava being judged partial in this affair to the English.

Towards the north-west, a number of islands of different sizes appeared, which were named Mercury Islands; Mercury Bay lies in latitude 36 deg. 47 min. south; longitude 184 deg. 4 min. west, and has a small entrance at its mouth. On account of the number of oysters found in the river, the captain gave it the name of Oyster River: Mangrove River (which the captain so called from the great number of those trees that grew near it) is the most secure place for shipping, being at the head of the bay. The north-west side of this bay and river appeared much more fertile than the east side. The inhabitants, though numerous, have no plantations. Their canoes are very indifferently constructed, and are not ornamented at all. They lie under continual apprehensions of Terratu, being considered by him as rebels. Shore iron sand is to be found in plenty on this coast, which proves that there are mines of metal up the country, it being brought down from thence by a rivulet.

On the 18th in the morning, we steered between the main, and an island which seemed very fertile, and as extensive

extensive as Ulitea. Several canoes filled with Indians, came along-side here, and the Indians sang their war song, but the Endeavour's people paying them no attention, they threw a volley of stones, and then paddled away; however they presently returned their insults. Tupia spoke to them, making use of his old arguments, that inevitable destruction would ensue if they persisted; they answered by brandishing their weapons, intimating, that if the English durst come on shore, they would destroy them all. Tupia still continued in expostulating with them, but to no purpose; and they soon gave another volley of stones; but upon a musket being fired at one of their boats, they made a precipitate retreat. We cast anchor in 23 fathom water in the evening, and early the next morning sailed up an inlet. Soon after two canoes came off, and some of the Indians came on board: they knew Tojava very well, and called Tupia by his name. Having received from us some presents, they retired peaceably, and apparently highly gratified.

On Monday the 20th, after having run five leagues from the place where we had anchored the night before, we came to an anchor in a bay called by the natives Oahauragee. Capt. Cook, Mr. Banks, Dr. Solander, and others set off in the pinnace to examine the bottom of the bay, and found the inlet end of a river, about nine miles above the ship. We entered into the fame with the first of the flood, and before we had proceeded three miles, the water was perfectly fresh. Here we saw an Indian town, built upon a small dry sand-bank, and entirely surrounded by a deep mud; the inhabitants of which with much cordiality invited us to land, and gave us a most friendly reception. We were now fourteen miles up the river, and finding little alteration in the face of the country, we landed on the west side to examine the lofty trees which adorned its banks, and were of a kind that we had not seen before. At the entrance of a wood we met with one ninety-eight feet high from the ground, quite strait, and nineteen feet in circumference; and as we advanced we found others still larger. The wood of these trees is very heavy, not fit for masts but would make exceeding fine planks. Our carpenter, who was with us, observed, that the timber resembled that of the pitch pine which is lightened by tapping. There were also trees of other kinds, all unknown to us, specimens of which we brought away. We re embarked about three o'clock with the first of the ebb, and Capt. Cook gave to the river the name of the Thames, it having a resemblance to the river of that name in England. It is not so deep, but it is as broad as the Thames is at Greenwich, and the tide of flood is as strong. On the evening of the 21st we reached the ship, all extremely tired, but happy at being on board.

On the 22d, early in the morning, we made sail, and kept plying till the flood obliged us once more to come to an anchor. The Captain and Dr. Solander went on shore to the west, but made no observations worth relating. After these gentlemen departed, the ship was surrounded with canoes, which kept Mr. Banks on board, that he might trade with the Indians, who bartered their arms and cloaths for paper, taking no unfair advantages. But though they were in general honest in their dealings, one of them took a fancy to a half minute glass, and being detected in secreting the same, it was resolved to give him a smatch of the cat-o'-nine-tails. The Indians interfered to stop the current of justice; but being opposed they got their arms from their canoes, and some of the people in them attempted to get on board. Mr. Banks and Tupia now coming upon deck, the Indians applied to Tupia, who informed them of the nature of the offender's intended punishment, and that he had no influence over Mr. Hicks, the commanding officer. They appeared pacified, and the criminal received not only a dozen, but afterwards a good drubbing from an old man, who was thought to be his father. The canoes immediately went off, the Indians saying, they should be afraid to return again on board. Tupia, however, brought them back, but they seemed to have lost that

confidence which they before reposed in us. Their stay was short, and after their departure we saw them not again, though they had promised to return with some fish.

On the 23d, the weather still continuing unfavourable, and the wind contrary, we kept plying down the river, anchoring between the tides; and at the north-west extremity of the Thames, we passed a point of land which the captain called Point Rodney; and another, at the north-east extremity, when we entered the bay, he named Cape Colville, in honour of Lord Colville. Not being able to approach land, we had but a distant view of the main for a course of near thirty miles. Under the name of the river Thames, the captain comprehended the whole bay. Cape Colville is to be distinguished by a high rock, and lies in 36 deg. 26 min. of south latitude, and 194 deg. 27 min. west longitude. The Thames runs south by east from the southern point of the cape. In some parts it is three leagues over, for about fourteen leagues, after which it becomes narrower. In some parts of the bay the water is 26 fathoms deep; the depth diminishes gradually, and in general the anchorage is good. To some islands that shelter it from the sea Captain Cook gave the name of Barrier Islands; they stretch north-west and south-east ten leagues. The country seemed to be thinly inhabited; the natives are well made, strong, and active; their bodies are painted with red ocre, and their canoes, which are well constructed, were ornamented with carved work.

On the 24th, we continued steering along the shore between the islands and the main; and in the evening anchored in an open bay, in about fourteen fathom water. Here we caught a large number of fish of the sciennie, or bream kind, enough to supply the whole ship's company with provision for two days. From our success Capt. Cook named this place Bream Bay, and the extreme points at the north end of the bay he called Bream Head. Several pointed rocks stand in a range upon the top of it, and some small islands which lie before it were called the Hen and Chickens. It is situated in latitude 35 deg. 46 min. seventeen leagues north-west of Cape Colville. There is an extent of land, of about thirty miles, between Point Rodney and Bream Head, woody and low. No inhabitants were visible; but from the fires perceived at night, we concluded it was inhabited.

On the 25th, early in the morning, we left the bay, and continued our course slowly to the northward, at noon our latitude was 36 deg. 36 min. south, and we saw some islands which we named the Poor Knights, at north-east by north, distant three leagues; the northernmost land in sight bore N. N. W. we were now at the distance of two miles from the shore, and had twenty-six fathom water. Upon the islands were a few towns that appeared fortified, and the land round them seemed well inhabited.

On the 26th, towards night, seven large canoes came off to us, with about two hundred men. Some of the Indians came on board, and let us know, that they had an account of our arrival. These were followed by two larger canoes, adorned with carving. The Indians, after having held a conference, came a-long side of the vessel. They were armed with various weapons, and seemed to be of the higher order. Their patoo-patoos were made of stone and whale-bone, ornamented with dog's hair, and were held in high estimation. Their complexion was darker than that of those to the south, and their faces were stained with amoco. They were given to pilfering, of which one of them gave an instance pretending to barter a piece of talc, wrought into the shape of an axe, for a piece of cloth; nor was he disposed to fulfil his agreement, till we compelled him to do it, by firing a musket over his head, which brought him back to the ship, and he returned the cloth. At three in the afternoon we passed a remarkable high point of land, bearing west, and it was called Cape Brett, in honour of Sir Piercy Brett. At the point of this cape is a round high hillock, and north-east by north, distant about a mile, is a curious arched

like that which has been already described. This cape, or at least part of it, is called by the natives Motugogo, and lies in 35 deg. 10 min. 30 sec. south latitude, and in 185 deg. 23 min. west longitude. To the south-west by west is a bay, in which is many small islands, and the point at the north-west entrance the captain named Point Pococke. There are many villages on the main as well as on the islands, which appeared well inhabited, and several canoes filled with Indians made to the ship, and in the course of bartering shewed the same inclination to defraud as their neighbours. These Indians were strong and well proportioned; their hair black, and tied up in a bunch stuck with feathers: their chiefs had garments made of fine cloth, decorated with dog's skin; and they were tataowed like those who had last appeared.

On the 27th, at eight in the morning, we found ourselves within a mile of many small islands, laying close under the main, at the distance of twenty-two miles from Cape Brett. Here we lay about two hours, during which time several canoes came off from the islands, which we called Cavalles, the name of some fish which we purchased of the Indians. These people were very insolent, using many frantic gestures, and pelting us with stones. Nor did they give over their insults, till some small shot hit one who had a stone in his hand. A general terror was now spread among them, and they all made a very precipitate retreat. For several days the wind was so very unfavourable, that the vessel rather lost than gained ground.

On the 29th, having weathered Cape Brett, we bore away to leeward, and got into a large bay, where we anchored on the south-west side of several islands, and suddenly came into four fathoms and a half water. Upon founding, we found we had got upon a bank, and accordingly weighed and dropped over it, and anchored again in ten fathoms and a half, after which we were surrounded by thirty-three large canoes, containing near three hundred Indians all armed. Some of them were admitted on board, and Captain Cook gave a piece of broad cloth to one of the chiefs, and some small presents to the other. They traded peaceably for some time, being terrified at the fire-arms, with the effects of which they were not unacquainted; but whilst the captain was at dinner, on a signal given by one of the chiefs, all the Indians quitted the ship, and attempted to tow away the buoy; a musquet was now fired over them, but it produced no effect; small shot was then fired at them, but it did not reach them. A musquet loaded with ball, was therefore ordered to be fired, and Otegoowgoow (son of one of the chiefs) was wounded in the thigh by it, which induced them immediately to throw the buoy overboard. To complete their confusion, a round shot was fired, which reached the shore, and as soon as they landed, they ran in search of it. If these Indians had been under any kind of military discipline, they might have proved a much more formidable enemy; but acting thus, without any plan or regulation, they only exposed themselves to the annoyance of the fire-arms, whilst they could not possibly succeed in any of their designs. The Captain, Mr. Banks, and Dr. Solander, landed upon the island, and the Indians in the canoes soon after came on shore. The gentlemen were in a small cove, and were presently surrounded by near 400 armed Indians; but the captain not suspecting any hostile design on the part of the natives, remained peaceably disposed. The gentlemen, marching towards them, drew a line, intimating that they were not to pass it: they did not infringe upon this boundary for some time; but at length, they sang the song of defiance, and began to dance, whilst a party attempted to draw the Endeavour's boat on shore, these signals for an attack being immediately followed by the Indians breaking in upon the line; the gentlemen judged it time to defend themselves, and accordingly the captain fired his musquet, loaded with small shot, which was seconded by Mr. Banks's discharging his piece, and two of the men followed his example. This threw the Indians into confusion, and they retreated, but were rallied again by one of the chiefs,

who shouted and waved his patoo-patoo. The Doctor now pointed his musquet at this hero, and hit him: this stopped his career, and he took to flight with the other Indians. They retired to an eminence in a collected body, and seemed dubious whether they should return to the charge. They were now at too great a distance for a ball to reach them, but these operations being observed from the ship, she brought her broadside to bear, and by firing over them, soon dispersed them. The Indians had in their skirmish two of their people wounded, but none killed: peace being thus restored, the gentlemen began to gather celery and other herbs, but suspecting that some of the natives were lurking about with evil designs, they repaired to a cave, which was at a small distance. Here they found the chief, who had that day received a present from the Captain; he came forth with his wife and brother, and solicited their clemency. It appeared, that one of the wounded Indians was a brother of this chief, who was under great anxiety lest the wound should prove mortal, but his grief was in a great degree alleviated, when he was made acquainted with the different effects of small shot and ball; he was at the same time assured, that upon any farther hostilities being committed, ball would be used. This interview terminated very cordially, after some trifling presents were made to the chief and his companions. The prudence of the gentlemen cannot be much commended: for had these 400 Indians boldly rushed in upon them at once with their weapons, the musquetry could have done very little execution; but supposing twenty or thirty of the Indians had been wounded, as it does not appear their pieces were loaded with ball, but only small shot, there would have remained a sufficient number to have massacred them, as it appears they do not give any quarter, and none could have been expected upon this occasion. It is true, when the ship brought her broadside to bear, she might have made great havoc amongst the Indians; but this would have been too late to save the party on shore.—Being in their boats, the English rowed to another part of the same island, when landing and gaining an eminence, they had a very agreeable and romantic view of a great number of small islands, well inhabited and cultivated. The inhabitants of an adjacent town approached unarmed, and testified great humility and submission. Some of the party on shore who had been very violent for having the Indians punished for their fraudulent conduct, were now guilty of trespasses equally reprehensible, having forced into some of the plantations, and dug up potatoes. The captain, upon this occasion shewed strict justice in punishing each of the offenders with twelve lashes: one of them being very refractory upon this occasion, and complaining of the hardship, thinking an Englishman had a right to plunder an Indian with impunity, received six additional lashes for his reward.

On the 30th, it being a dead calm, two boats were sent to sound the harbour; when many canoes came up and traded with great probity; the gentlemen went again on shore and met with a very civil reception from the natives; and this friendly intercourse continued all the time they remained in the bay, which was several days. Being upon a visit to the old chief, he shewed them the instruments used in tataowing, which were very like those employed at Otaheite upon the like occasion. They saw the man who had been wounded by the ball, when the attempt was made to carry off the ship's buoy; and though it had gone through the fleshy part of his arm, it did not seem to give him the least pain or uneasiness.

On Tuesday the 5th of December in the morning, we weighed anchor, but were soon becalmed, and a strong current setting towards the shore, we were driven in with such rapidity, that we expected every moment to be run upon the breakers, which appeared above water not more than a cable's length distance, and we were so near the land, that Tupia, who was totally ignorant of the danger, held a conversation with the Indians, who were standing on the beach. We were happily relieved however, from this alarming situation

tion by a fresh breeze suddenly springing up from the shore. The bay which we had left was called the Bay of Islands, on account of the numerous islands it contains; we caught but few fish while we lay there, but procured great plenty from the natives, who were extremely expert in fishing, and displayed great ingenuity in the form of their nets, which were made of a kind of grass; they were two or three hundred fathoms in length, and remarkably strong, and they have them in such plenty that it is scarcely possible to go a hundred yards without meeting with numbers lying in heaps. These people did not appear to be under the government of any particular chief or sovereign, and they seemed to live in a perfect state of friendship, notwithstanding their villages were fortified. According to their observations upon the tides, the flood comes from the south, and there is a current from the west.

On the 7th of December, being Thursday, several observations of the sun and moon were made, whereby we found our latitude to be 185 deg. 36 min. west. In the afternoon we were close under the Cavalles. Several canoes put off and followed the Endeavour, but a light breeze springing up, we did not wait for them. The next morning, being the 8th, at ten o'clock we tacked and stood in for the shore, from which we were distant nearly six leagues. By day-light on the 9th we were in with the land, about seven leagues to the westward of the Cavalles; and soon after came to a deep bay, which was named Doubleless Bay. The entrance thereto is formed by two points, distant from each other five miles, and which lie west north-west and east south-east. The wind preventing us putting in here, we steered for the westernmost land in sight and before we got the length of it, we were becalmed. During the calm we were visited by several canoes; but the Indians having heard of our guns, were afraid to come on board; however we bought some of their fish, and learned from them, by the assistance of Tupia, that we were about two days sail from a place called Moore Whennua, where the land changed its shape, and turning to the south extended no more westward. This place was concluded to be the land discovered by Tasman, which he called Cape Maria Van Diemen. They also informed us, that to the north-north-west there was an extensive country discovered by their ancestors, which they named Ulimaroa, where the inhabitants lived upon hogs, called in their language Boah, the very name given them, by those who inhabited the South-sea Islands.

On Sunday the 10th, a breeze springing up, we stood off to the north, and found by observation our latitude to be 34 deg. 44 min. south. On the 11th, early in the morning the land, with which we stood in, appeared low and barren, but not destitute of inhabitants. It

forms a peninsula, which the captain called Knuckle Point, and the bay that lies contiguous thereto he named Sandy Bay. In the middle of this is a high mountain, which we called Mount Camel, on account of its resemblance to that animal. We saw one village on the west side of this mount, and another on the east side. Several canoes put off but could not reach the ship, which tacked, and stood to the northward, till the afternoon of the 12th, when she stood to the north-east. Towards night we were brought under double reefed topails; and in the morning it was so tempestuous as to split the main topail and the fore mizen-top sails. Early in the morning of the 14th we saw land to the southward, at the distance of eight or nine leagues; and on the 15th we tacked and stood to the westward. On the 16th we discovered land from the mast head, bearing south-south-west. On Sunday the 17th we tacked in thirty five fathom, and found we had not gained one inch to windward the last twenty-four hours. We saw a point of land, the northern extremity of New Zealand, which Capt. Cook named North Cape. It lies in latitude 34 deg. 22 min. south, and in 185 deg. 55 min. west longitude; we continued standing off and on till the 23d when about seven o'clock we discovered land bearing south half east.

On the 24th we saw the same land south-east by south four leagues distant, which we judged to be the Islands of the Three Kings. The chief of these is in latitude 34 deg. 12 min. south, and 187 deg. 48 min. west longitude, and distant about 14 and 15 leagues from North Cape. Mr. Banks went out in the long-boat and shot some birds that nearly resembled geese, and they were very good eating. On Christmas-day, December the 25th, we tacked, and stood to the southward. On the 26th we had no land in sight, and were twenty leagues to the westward of North Cape. At mid-night we tacked and stood to the northward. On the 27th it blew a storm from the east, accompanied with heavy showers of rain, which compelled us to bring the ship to, under her mainfail. The gale continued till Thursday the 28th, when it fell about two o'clock in the morning; but at eight increased to a hurricane, with a prodigious sea. At noon the gale somewhat abated, but we had still heavy squalls. On the 29th in the evening, we wore and stood to the north-west. On Saturday the 30th, we saw land bearing north-east, which we concluded to be Maria van Diemen; and it corresponded with the account we had received of it from the Indians. We wore at mid-night, and stood to the south-east. On the 31st we tacked at seven in the evening, and stood to the westward. We were now distant from the nearest land about three leagues, and had somewhat more than forty fathom water.

C H A P. VII.

The Endeavour continues her voyage, January the 1st 1770, round North Cape to Queen Charlotte's Sound—That part of the coast described—Transactions in the Sound—She sails between two islands, and returns to Cape Turnagain—A stocking custom of the inhabitants—A visit to a Hippah, and other remarkable particulars—The circum-navigation of this country completed—The coast and Admiralty Bay described—The departure of the Endeavour from New Zealand, and other remarkable particulars—A descriptive account of New Zealand—Its first discovery by Tasman—Situation and productions—An account of the inhabitants—Their dress, ornaments, and manner of life—Their canoes, navigation, tillage, weapons, music, government, religion, and language—The arguments in favour of a Southern Continent converted.

A. D. 1770. **J**anuary the 1st, on Monday at six in the morning, being New Year's Day, we tacked, and stood to the eastward. At noon we stood to the westward; found our latitude to be 34 deg. 37 min. south; our distance from the Three Kings ten or eleven leagues; and from Cape Maria van Diemen about four leagues and an half, in fifty-four fathom water. On the 3d we saw land; it was high and flat, trending away to the south-east, beyond the reach of the naked eye. It is remarkable, that at midsummer we met with a violent gale of wind, in latitude 350

south; and that we were three weeks in getting ten leagues to the westward, and five weeks in getting fifty leagues, for at this time it was so long since we passed Cape Brett.

On the morning of the 4th we stood along shore. The coast appeared sandy, barren, dreary, and inhospitable. Steering northward on the 6th we saw land again, which we supposed to be Cape Maria. On the 7th we had light breezes, and were at times becalmed, when we saw a sun-fish, short and thick, with two large fins, but scarcely any tail, resembling a shark

in colour and size. We continued steering east till the 9th, when we were off a point of land, which Capt. Cook named Woody Head. From the south-west we also saw a small island, and called it Gannet Island. Another point, remarkably high to the east-north-east, the captain named Albetrofs Point; on the north side whereof a bay is formed, promising good anchorage. At about two or three leagues distance from Albetrofs Point, to the north east we discovered a remarkable high mountain, the peak of which is equal in height to that of Teneriffe. Its summit was covered with snow, and we gave it the name of mount Egmont, in honour of the earl of that name. It lies in latitude 39 deg. 16 min. south, and 185 deg. 15 min. west longitude. The country round it is exceeding pleasant, having an agreeable verdure intersected with woods, and the coast forms an extensive cape which Capt. Cook named Cape Egmont. To the north of this are two small islands, in the form of a sugar-loaf. This day being the 13th we had heavy showers of rain, accompanied with thunder and lightening. We continued to steer along the shore at the distance of between two and three leagues, and between seven and eight had a transient view of Mount Edgcombe, which bore north-west distant about ten leagues.

On the 14th when sailing south-east by south, the coast ran more southerly, and soon after five in the morning we saw land, for which we hauled up. At noon the north-west extremity bore south 63 west; and some high land, in appearance an island, bore south south-east, distant five leagues. We were now in a bay, and by observation in latitude 40 deg. 27 min. south, longitude 184 deg. 39 min. west. In the evening, at eight o'clock, the land that bore south 63 west, now bore north 59 west, distant seven leagues, and appeared like an island. Between this land and Cape Egmont lies the bay, on the west-side of which we were at this time. The land here is high and beautifully variegated with hills and vales. At this place Capt. Cook proposed to careen the ship, and to take in a fresh supply of wood and water. Accordingly,

On the 15th at day-break, we steered for an inlet, when, it being almost a calm, the ship was carried by a current, or the tide, within a cable's length of the shore; but by the assistance of the boats she got clear. While effecting this, we saw a sea-lion, answering the description given of a male one in Commodore Anson's voyages. About one o'clock in the afternoon we hauled round the south-west point of the island, and the inhabitants of a village were immediately upon seeing us up in arms. At two we anchored in a very safe cove on the north-west side of the bay, and moored in eleven fathom water, with a soft ground. In passing the point of the bay we had observed an armed sentinel on duty, who was twice relieved; and now four canoes came off, for purpose, as we imagined, of reconnoitring; for none of the Indians would venture on board, except an old man who seemed of elevated rank. His countrymen expostulated with him, laid hold of him, and took great pains to prevent his coming aboard, but they could not divert him from his purpose. We received him with the utmost civility and hospitality. Tupia and the old man joined noses, according to the custom of the country, and having received several presents, he retired to his associates, who began to dance and laugh, and then retired to their fortified village. Whether their expressions of joy were tokens of enmity or friendship we could not determine, having seen them dance when inclined both to war and peace. Capt. Cook and other gentlemen now went on shore, at the bottom of the cove, where they met with plenty of wood, and a fine stream of excellent water, and on hauling the seine were very successful, having caught three hundred weight of fish in a short time, which was equally distributed among the ships company.

On the 16th, at day-break we were employed in careening the bark, when three canoes came off with a great number of Indians, who brought several of their women with them, which circumstance was thought to be a favourable presage of their peaceable disposition;

but they soon convinced us of our mistake, by attempting to stop the long boat; upon which Captain Cook had recourse to the old expedient of firing shot over their heads, which intimidated them for the present; they soon gave fresh proofs of treacherous designs; for one of them snatched at some paper from our market-man, and missing it, put himself in a threatening attitude; whereupon some shot was fired, which wounded him in the knee; but Tupia still continued conversing with his companions, making enquiries concerning their traditions respecting the antiquities of their country. He also asked them, if they had ever before seen a ship as large as the Endeavour? to which they replied, that they had not, nor ever heard, that such a vessel had been on their coast, though Taf-man certainly touched here, it being only four miles south of Murderer's Bay. In all the coves of this bay we found plenty of cuttle fish, breams, baracootas, gurnard, mackarel, dog-fish, soles, dabs, mullets, drums, scorpenas, or rock-fish, cole-fish, flags, chimeras, &c. The inhabitants catch their fish in the following manner. Their net is cylindrical, extended by several hoops at the bottom, and contracted at the top. The fish going in to feed upon the bait are caught in great abundance. In this island are birds of various kinds, and in great numbers, particularly parrots, wood-pigeons, water hens, hawks, and many different singing birds. An herb, a species of Philadelphia, was used here instead of tea, and a plant called Tecgoomme, resembling rug-cloaks, served the natives for garments. The environs of the cove where the Endeavour lay is covered entirely with wood, and the supple-jacks are so numerous, that it is with difficulty that passengers can pursue their way; here is a numerous sand-fly, that is very disagreeable. The tops of many hills were covered with fern. The air of the country is very moist, and has some qualities that promote putrefaction, as birds that had been shot but a few hours were found with maggots in them. The women who accompanied the men in their canoes, wore a head-dress, which we had no where met with before; it was composed of black feathers, tied in a bunch on the top of the head, which greatly increased its height. The manner of their disposing of their dead is very different to what is practised in their southern islands, they tie a large stone to the body, and throw it into the sea. We saw the body of a woman who had been disposed of this way, but which, by some accident had disengaged itself from the stone, and was floating upon the water. The Captain, Mr. Banks, and the doctor visited another cove, about two miles from the ship. There was a family of Indians who were greatly alarmed at the approach of these gentlemen, all running away except one; but upon Tupia's conversing with him, the others returned. They found, by the provisions of this family, that they were cannibals, here being several human bones that had been lately dressed and picked, and it appeared that a short time before, six of their enemies having fallen into their hands, they had killed four and eaten them, and that the other two were drowned in endeavouring to make their escape. They made no secret of this abominable custom, but answered Tupia, who was desirous to ascertain the fact, with great composure, that his conjectures were just, that they were the bones of a man, and testified by signs, that they thought human flesh delicious food. Upon being asked, Why they had not eaten the body of the woman that had been floating upon the water? they answered, She died of a disorder, and that moreover she was related to them, and they never ate any but their enemies. Upon Mr. Banks still testifying some doubts concerning the fact, one of the Indians drew the bone of a man's arm through his mouth, and this gentleman had the curiosity to bring it away with him. There was a woman in this family whose arms and legs were cut in a shocking manner, and it appeared she had thus wounded herself because her husband had lately been killed and eaten by the enemy. Some of the Indians brought four skulls one day to sell, which they rated at a very high price. The brains had been taken out, and probably

Curiously ARCHED ROCK on the Coast of New Zealand.

A New Zealand Chief whose head is ingeniously ^{plagiarized} TATAWED, and a Subaltern Warrior of the same country.

bably eaten, but the skull and hair remained. They seemed to have been dried by fire, in order to preserve them from putrefaction. The gentlemen likewise saw the bail of a canoe, which was made of a human skull. On the whole their ideas were so horrid and brutish, that they seemed to pride themselves upon their cruelty and barbarity, and took a particular pleasure in shewing the manner in which they killed their enemies, it being considered as very meritorious to be expert at this destruction. The method used was to knock them down with their patoo-patoos, and then rip up their bellies.

Great numbers of birds usually begun their melody about two o'clock in the morning, and serenaded us till the time of their rising. This harmony was very agreeable, as the ship lay at a convenient distance from the shore to hear it. These feathered choristers, like the English nightingales, never sing in the day-time.

On the 17th, the ship was visited by a canoe from the hippah, or village; it contained, among others, the aged Indian, of superior distinction, who had first visited the English upon their arrival. In a conference which Tupia had with him, he testified his apprehensions, that their enemies would very soon visit them, and repay the compliment, for killing and eating the four men. On the 18th, we received no visit from the Indians; but going out in the pinnace to inspect the bay, we saw a single man in a canoe fishing, in the manner already described. It was remarkable, that this man did not pay the least attention to the people in the pinnace, but continued to pursue his employment even when we came along-side of him, without once looking at us. Some of the Endeavour's people being on shore, found three human hip bones, close to an oven; these were brought on board, as well as the hair of a man's head, which was found in a tree. The next day a forge was set up to repair the iron-work; and some Indians visited the ship with plenty of fish which they bartered very fairly for nails.

On the 20th, in the morning, Mr. Banks purchased of the old Indian a man's head, which he seemed very unwilling to part with; the skull had been fractured by a blow, and the brains were extracted, and like the others, it was preserved from putrefaction. From the care with which they kept these skulls, and the reluctance with which they bartered any, it was imagined they were considered as trophies of war, and testimonials of their valour. In this day's excursion, we did not meet with a single native; the ground on every side was quite uncultivated; but we discovered a very good harbour. The succeeding day the ship's company were allowed to go on shore for their amusement, and the gentlemen employed themselves in fishing, in which they were very successful. Some of the company in their excursion met with fortifications that had not the advantage of an elevated situation, but were surrounded by two or three wide ditches, with a draw-bridge, such as, though simple in its structure, was capable of answering every purpose against the arms of the natives. Within these ditches is a fence, made with stakes, fixed in the earth. A decisive conquest or victory over the besieged, occasions an entire depopulation of that district, as the vanquished, not only those who are killed, but the prisoners likewise are devoured by the victors.

The 22d was employed by Mr. Banks and Dr. Solander, in collecting of plants, whilst Capt. Cook made some observations on the main land on the south-east side of the inlet, which consisted of a chain of high hills, and formed part of the south-west side of the strait; the opposite side extended far to the east. He also discovered a village, and many houses that had been deserted, and another village that appeared to be inhabited. There were many small islands round the coast, that seemed intirely barren, and what few inhabitants were upon them lived principally upon fish. On the 24th, we visited a hippah, which was situated on a very high rock, hollow underneath, forming a fine natural arch, one side of which joined to the land, and the other rose out of the sea. The inhabitants received us with great civility, and very readily shewed

us every thing that was curious. This hippah was partly surrounded with palisades, and it had a fighting stage, like that already described. Here we met with a cross resembling a crucifix, which was erected as a monument for a deceased person; but could not learn how his body was disposed of. From a conversation that Tupia had with these people, a discovery was made that an officer being in a boat near this village, and some canoes coming off, made him imagine they had hostile designs, and he fired upon them with ball, which made them retire with much precipitation, but they could not effect their retreat, before one of them was wounded. What made this rash action the more to be lamented was, that the Indians gave afterwards every possible assurance that their intentions upon this occasion were entirely friendly.

On the 25th the Captain, Mr. Banks, and Dr. Solander, went on shore to shoot, when they met with a numerous family, who were among the creeks catching fish: they behaved very civilly, and received some trifling presents from the gentlemen, who were loaded by way of return with the kisses and embraces of both sexes, young and old. The next day being the 26th, they made another excursion in the boat, in order to take a view of the strait, that passes between the eastern and western seas. To this end they attained the summit of a hill, but it being hazy in the horizon, they could see but to a small distance to the east; however, it was resolved to explore the passage in the ship when they should put to sea. Before their departure from this hill, they erected a pyramid with stones, and left some mulket balls, small shot and beads, that were likely to stand the test of time, and would be memorials, that this place had been visited by Europeans. On our return, having descended the hill, we made a hearty meal of the shaggs and fish, procured by our guns and lines; and which were dressed by the boat's crew in the place we had appointed. Here we were respectfully received by another Indian family, who added to their civilities strong expressions of kindness and pleasure. They shewed us where to get water, with every other office as was in their power. From hence we visited another hippah, seated on a rock almost inaccessible: it consisted of about one hundred houses and a fighting stage. We made the friendly inhabitants some small presents of paper, beads, and nails, and they in return furnished us with dried fish. On the 27th and 28th our company were engaged in making necessary repairs, catching fish, and getting the Endeavour ready to continue her voyage.

On Monday the 29th, we were visited by our old friend Topoa in company with other Indians, from whom we heard, that the man who had received a wound near the hippah, was dead; but this report proved afterwards groundless; and we found that Topoa's discourses were not always to be taken literally. During the time the bark was preparing for sea, Mr. Banks and Dr. Solander often went on shore; but their walks were circumscribed by the luxuriant climbers which filled up the space between the trees, and rendered the woods impassable. Capt. Cook also made several observations on the coast to the north-west, and perceived many islands, forming bays, in which there appeared to be good anchorage for shipping. He also erected another pyramid of stones, in which he put some bullets, &c. as before, with the addition of a piece of our silver coin, and placed part of an old pendant on the top, to distinguish it. Returning to the ship he met with many of the natives, of whom he purchased a small quantity of fish.

On Tuesday, the 30th, some of our people, who were sent out early in the morning to gather celery, met with about twenty Indians, among whom were five or six women, whose husbands had lately been made captives. They sat down upon the ground together, and cut many parts of their bodies in a most shocking manner, with shells, and sharp pieces of talc or jasper, in testimony of their excessive grief. But what made the horrid spectacle more terrible, was, that the male Indians who were with them, paid not the least attention to it, but with the greatest unconcern imaginable, employed them-

selves in repairing their huts. This day the carpenter having prepared two posts, they were set up as memorials, being inscribed with the date of the year, the month, and the ship's name. One of them we erected at the watering place, with the union-flag hoisted upon the top; and the other in the island that lies nearest the sea, called by the natives Motuara; and the inhabitants being informed, that those posts were set up to acquaint other adventurers that the Endeavour had touched at this place, they promised never to destroy them. Capt. Cook then gave something to every one present, and to Topoa our old friend, he presented a silver three-pence, dated 1736, and some spike nails which had the king's broad arrow cut deep upon them. After which he honoured this inlet with the name of Queen Charlotte's Sound; and at the same time took possession of it in the name and for the use of his present majesty. The whole of this day's business concluded with drinking a bottle of wine to the queen's health. The bottle was given to the old man, who received the present with strong signs of joy. We must not omit here to observe, that Topoa being questioned concerning a passage into the eastern-sea, answered, that there was certainly such a passage. He also said, that the land to the south-west of the strait, where we then were, consisted of two whennuas or islands, named Tovy Poenamoo, which signifies "the water of green talc;" which might probably be the name of a place where the Indians got their green talc, or stone, of which they make their ornaments and cutting tools. He also told us, there was a third Whennua, eastward of the strait, called Eacheinomauee, of considerable extent; the circumnavigation of which would take up many moons: he added, that the land on the borders of the strait, contiguous to this inlet, was called Tiera Witte. Having procured this intelligence, and concluded the ceremonies at fixing up the monumental memorial, we returned to the ship. The old man attended us in his canoe, and returned home after dinner.

Wednesday the 31st, having taken in our wood and water, we dispatched one party to make brooms, and another to catch fish. Toward the close of the evening we had a strong gale from the north-west, with such heavy showers, that our sweet little warblers on shore suspended their wild notes, with which till now they had constantly serenaded us during the night, affording us a pleasure not to be expressed, and the loss of which we could not at this time refrain from regretting.

On the 1st of February the gale increased to a storm, with heavy gusts from the main land, which obliged us to let go another anchor. Towards night they became more moderate, but the rain poured down with impetuosity, that the brook at our watering place overflowed its banks, and carried away to our loss ten casks full of water.

On Saturday the 3d, we went over to the Hippah on the east-side of Charlotte's Sound, and procured a considerable quantity of fish. The people here confirmed all that Topoa had told us respecting the strait and the unknown country. At noon when we took leave of them, some showed signs of sorrow, others of joy that we were going. When returning to the ship some of our company made an excursion along the shore northward, to traffic for a further supply of fish, but without success. Sunday the 4th, Mr. Banks and Dr. Solander were engaged in collecting shells, and different kinds of feeds.

On the 5th we got under sail, but the wind soon falling, we came again to anchor a little above Motuara. Topoa here paid us a visit to bid us farewell. Being questioned whether he had ever heard, that such a vessel as ours had ever visited the country, he replied in the negative; but said, there was a tradition of a small vessel having come from Ulimora, a distant country in the north, in which were only four men, who on their landing, were all put to death. The people of the Bay of Islands and Tupia had some confused traditionary notions about Ulimora, but from their accounts we could draw no certain conclusion. This day

Mr. Banks and Dr. Solander went again on shore in search of natural curiosities, and by accident met with a very amiable Indian family, among whom was a widow, and a pretty youth about ten years of age. The woman mourned for her husband, according to the custom of the country, with tears of blood; and the child, by the death of his father, was the proprietor of the land where we had cut our wood. The mother and son were sitting upon mats, the rest of the family of both sexes, about seventeen in number, sat round them. They behaved with the utmost hospitality and courtesy, and endeavoured to prevail with us to stay all night; but expecting the ship to sail, we could not accept of their pressing invitation. This family seemed the most intelligent of any Indians we had hitherto conversed with, which made us regret our late acquaintance with them; for had we fallen into their company before, we should probably have gained more information from them in one day, than we had been able to acquire during our whole stay upon the coast.

Monday the 6th in the morning, the Endeavour sailed out of the bay, which, from the savage custom of eating human flesh, we called Cannibal Bay. We bent our course to an opening in the east; and when in the mouth of the strait were becalmed in latitude 41° 0 south and 184 deg. 45 min. west longitude. The two points that form the entrance we called Cape Koamaro, and point Jackson. The land forming the harbour or cove in which we lay is called by the Indians Totarranue; the harbour itself, named by the captain Ship Cove, is very convenient and safe. It is situated on the west-side of the cove, and is the southermost of the three coves within the island of Motuara, between which and the island of Hamote, or between Motuara or western-shore is the entrance. In the last of these inlets are two ledges of rocks, three fathom under water, which may easily be known by the sea weed that grows upon them. Attention must also be paid to the tides, which, when there is little wind, flow about nine or ten o'clock at the full and change of the moon, and rise and fall about seven feet and a half, passing through the strait from the south-east. The land about this sound, which we saw at the distance of twenty leagues, consists entirely of high hills, and deep vallies, well stored with a variety of excellent timber, fit for all purposes except masts, for which it is too hard and heavy. On the shore we found plenty of shags, and a few other species of wild fowl, that are very acceptable food to those who have lived long upon salt provisions. The number of inhabitants is not greater than four hundred, who are scattered along the coast, and upon any appearance of danger retire to their Hippahs or forts, in which situation we found them. They are poor, and their canoes without ornaments. The traffic we had with them was wholly for fish; but they had some knowledge of iron, which the natives of other parts had not. On our arrival they were much pleased with our paper; but when they knew it would be spoiled by the wet, they would not have it. English broad-cloth, and red Kersey they highly esteemed.

Leaving the sound we stood over to the eastward, and were carried by the rapidity of the current very close to one of the two islands that lie off Cape Koamaroo, at the entrance of Queen Charlotte's Sound. At this time we were every moment in danger of being dashed to pieces against the rocks, but after having veered out 150 fathoms of cable, the ship was brought up, when the rocks were not more than two cables length from us. Thus we remained, being obliged to wait for the tide's ebbing, which did not take place till after midnight.

On the 7th, at eight o'clock in the morning we weighed anchor, and a fresh breeze with a tide of ebb hurried us through the strait with great swiftness. The narrowest part of this strait lies between Cape Tierrawitte and Cape Koamaroo, the distance between which we judged to be five leagues. The length of the strait we could not determine. In passing it, we think it safest to keep to the north-east shore, for on this tide we saw nothing to fear. Cape Tierrawitte lies in 41 deg.

FAMILY IN DUSK BAY, NEW ZEALAND.

41 deg. 44 min. of south latitude, and 183 deg. 45 min. of west longitude. And Cape Koamaroo is 41 deg. 34 min. south, and in 113 deg. 30 min. west longitude. About nine leagues from the former cape, and under the same shore north, is a high island, which the captain called Entry Isle. We were now facing a deep bay which we called Cloudy Bay. Some of our gentlemen doubting whether Eahienomauwee was an island, we steered south-east, in order to clear up this doubt; but the wind shifting we stood eastward, and steered north-east by east all night. The next morning they were off Cape Palliser, and found that the land stretched away to the north-eastward of Cape Turnagain. In the afternoon, three canoes came off, having several Indians on board. These made a good appearance, and were ornamented like those on the northern coast. There was no difficulty in persuading them to come on board, where they demeaned themselves very civilly, and a mutual exchange of presents took place. As they asked for nails it was concluded that they heard of the English, by means of the inhabitants of some of the other places at which we had touched. Their dress resembled that of the natives of Hudson's Bay. One old man was tataowed in a very particular manner, he had likewise a red streak across his nose; and his hair and beard were remarkable for their whiteness. The upper garment that he wore was made of flax, and had a wrought border: under this was a sort of petticoat of a cloth called Aooroe Waow. Teeth and green stones decorated his ears: he spoke in a soft and low key, and it was concluded, from his deportment, that he was a person of distinguished rank among his countrymen, and these people withdrew greatly satisfied with the presents that they had received.

On the 9th in the morning, we discovered that Eahienomauwee was really an island. About sixty Indians in four double canoes came within a stone's throw of the ship, on the 14th of February. As they surveyed her with surprise, Tupia endeavoured to persuade them to come nearer, but this they could not be prevailed on to do. On this account the island was denominated the Island of Lookers-on. Five leagues distant from the coast of Tovy Poenamoo, we saw an island which was called after Mr. Banks's name; a few Indians appeared on it, and in one place they discovered a smoke, so that it was plain the place was inhabited. Mr. Banks going out in his boat for the purpose of shooting, killed some of the Port Egmont hens, which were like those found on the isle of Fare, and the first that they had seen upon this coast. A point of land was observed on Sunday the 25th in latitude 45 deg. 35 min. south, to which Capt. Cook gave the name of Cape Saunders, in honour of Admiral Saunders. We kept off from the shore, which appeared to be interspersed with trees, and covered with green hills, but no inhabitants were discovered.

On the 4th of March, several whales and seals were seen; and on the 9th we saw a ledge of rocks, and soon after another ledge at three leagues distance from the shore, which we passed in the night to the northward, and at day-break observed the others under our bows, which was a fortunate escape; and in consideration of their having been so nearly caught among these, they were denominated the Traps. We called the southernmost point of land, the South Cape, and found it to be the southern extremity of the whole coast. Proceeding northward, the next day we fell in with a barren rock about fifteen miles from the main land, which was very high, and appeared to be about a mile in circumference; and this was named Solander's Island.

On the 13th, we discovered a bay containing several islands, where we concluded if there was depth of water, shipping might find shelter from all winds. Dusky Bay was the appellation given to it by the captain, and five high peaked rocks, for which it was remarkable, caused the point to be called Five Fingers. The westernmost point of land upon the whole coast, to the southward of Dusky Bay, we called West Cape. The next day we passed a small narrow opening, where

there seemed to be a good harbour formed by an island, the land behind which exhibited a prospect of mountains covered with snow.

On the 16th, we passed a point which consisted of high red cliffs, and received the name of Cascade Point, on account of several small streams which fell down it. In the morning of the 18th the valleys were observed covered with snow as well as the mountains, which seemed to have fallen the night before, when we had rain at sea. Thus we passed the whole north-west coast of Tovy Poenamoo, which had nothing worth our observation but a ridge of naked and barren rocks covered with snow, some of which we conjectured might probably have remained there ever since the creation. As far as the eye could reach, the prospects were in general wild, craggy, and desolate; scarcely any thing but rocks to be seen, the most of which Dr. Hawkesworth describes as having nothing but a kind of hollows, and dreadful fissures instead of valleys between them. From this uncomfortable country we determined to depart, having sailed round the whole country by the 27th of this month. Capt. Cook therefore went on shore in the long-boat, and having found a place proper for mooring the ship, and a good watering place, the crew began to fill their casks, while the carpenter was employed in cutting wood. The captain, Mr. Banks, and Dr. Solander, went in the pinnace to examine the bay, and the neighbouring country. Landing there they found several plants of a species which was before unknown to them; no inhabitants appeared; but they saw several huts which seemed to have been deserted a long time before: all the wood and water being taken on board, the vessel was ready to sail by the time that they returned in the evening, and it was now resolved at a council of war to steer for the coast of New Holland, in the course of their return by the way of the East-Indies.

On the 31st, we took our departure from an eastern point of land, to which we gave the name of Cape Farewell, calling the bay out of which we sailed, Admiralty Bay; and two capes, Cape Stephens, and Cape Jackson, (the names of the two secretaries of the Admiralty board.) We called a bay between the island and Cape Farewell, Blind Bay, which was supposed to have been the same that was called Murderers Bay, by Tasman, the first discoverer of New Zealand, but though he named it Staten Island, wishing to take possession of it for the States General, yet being attacked here by the Indians he never went on shore to effect his purpose. This coast, now more accurately examined, is discovered to consist of two islands, which were before thought to be a part of the southern continent so much sought after.

They are situated between the 34th and 48th deg. of south latitude, and between 181 deg. and 194 deg. west longitude. The northern island is called Eahienomauwee, and the southern is named Tovy Poenamoo by the natives. The former, though mountainous in some places, is stored with wood, and in every valley there is a rivulet. The soil in those valleys is light, but fertile and well adapted for the plentiful production of all the fruits, plants and corn of Europe. The summer, though not hotter, is in general of a more equal temperature than in England; and from the vegetables that were found here it was concluded, that the winters were not so severe. The only quadrupeds that were discovered were dogs and rats, and of the latter very few, but the former the inhabitants (like those of Otaheite) breed for food. There are seals and whales on the coasts, and we once saw a sea-lion. The birds are hawks, owls, quails, and some melodious song birds. There are ducks, and shags of several sorts, like those of Europe, and the gannet, which is of the same sort. Albatrosses, shearwaters, penguins, and pintados, also visit the coast. The insects found here are, butterflies, flesh-flies, beetles, sand-flies, and musquitos.

Tovy Poenamoo is barren and mountainous, and appeared to be almost destitute of inhabitants.

The sea that washes these islands abounds with delicate and wholesome fish. Whenever the vessel came to an anchor,

anchor, enough were caught with hook and line only, to supply the whole ships company; and when we finished with nets, every mess in the ship, where the people were industrious, salted as much as supplied them for several weeks. There were many sorts of fish here which we had never before seen, and which the sailors named according to their fancies. They were sold on moderate terms to the crew: among the rest, fish like the skate, eels, congers, oysters, flat-fish resembling soles and flounders, cockles and various sorts of mackarel were found in abundance upon the coast.

Here are forests abounding with trees, producing large, strait and clean timber. One tree about the size of our oak, was distinguished by a scarlet flower, composed of several fibres, and another which grows in swampy ground, very strait and tall, bearing small bunches of berries, and a leaf resembling that of the yew-tree. About 400 species of plants were found, all of which are unknown in England, except garden nightshade, fow thistle, two or three kinds of fern, and one or two sorts of grass. We found wild celery, and a kind of cresses, in great abundance, on the sea-shore; and of eatable plants raised by cultivation, only cocoas, yams, and sweet potatoes. There are plantations of many acres of these yams and potatoes. The inhabitants likewise cultivate the gourd; and the Chinese paper mulberry-tree is to be found, but in no abundance.

In New Zealand is only one shrub or tree, which produces fruit, which is a kind of berry almost tasteless; but they have a plant which answers all the uses of hemp and flax. There are two kinds of this plant, the leaves of one of which are yellow, and the other a deep red, and both of them resemble the leaves of flags. Of these leaves they make lines and cordage, and much stronger than any thing of the kind in Europe. These leaves they likewise split into breadths, and tying the slips together, form their fishing nets. Their common apparel, by a simple process, is made from the leaves, and their finer, by another preparation, is made from the fibres. This plant is found both in high and low ground, in dry mould and in deep bogs; but as it grows largest in the latter, that seems to be its proper soil.

The natives are as large as the largest Europeans. Their complexion is brown, but little more so than that of a Spaniard. They are full of flesh, but not lazy and luxurious; and are stout and well shaped. The women possess not that delicacy, which distinguishes the European ladies; but their voice chiefly distinguishes them from the men. The men are active in a high degree; their hair is black, and their teeth are white and even. The features of both sexes are regular; they enjoy perfect health, and live to an advanced age. They appeared to be of a gentle disposition, and treat each other with the utmost kindness; but they are perpetually at war, every little district being at enmity with all the rest. This is owing, most probably, to the want of food in sufficient quantities at certain times. As they have neither black cattle, sheep, hogs, nor goats; so their chief food was fish, which being not always to be had, they are in danger of dying through hunger. They have a few dogs; and when no fish is to be gotten, they have only vegetables, such as yams and potatoes, to feed on; and if by any accident these fail them, their situation must be deplorable. Notwithstanding the custom of eating their enemies, the circumstances and temper of these people is in favour of those who might settle among them as a colony.

The inhabitants of New Zealand are as modest and reserved in their behaviour and conversation as the most polite nations of Europe. The women, indeed, were not dead to the softer impressions; but their mode of consent was in their idea as harmless as the consent to marriage with us, and equally binding for the stipulated time. If any of the English addressed one of their women, he was informed, that the consent of her friends must be obtained, which usually followed, on his making a present. This done he was obliged to treat his temporary wife as delicately as we do in England. A

gentleman who sailed in the Endeavour, having addressed a family of some rank, received an answer, of which the following is an exact translation. "Any of these young ladies will think themselves honoured by your addresses, but you must first make me a present, and you must then come and sleep with us on shore, for day-light must by no means be a witness of what passes between you."

These Indians anoint their hair with oil melted from the fat of fish or birds. The poorer people use that which is rancid, so that they smell very disagreeable; but those of superior rank make use of that which is fresh. They wear combs both of bone and wood, which is considered as an ornament when stuck upright in the hair. The men tie their hair in a bunch on the crown of the head, and adorn it with feathers of birds, which they likewise sometimes place on each side of the temples. They commonly wear short beards. The hair of the women sometimes flows over their shoulders, and sometimes is cut short. Both sexes, but the men more than the women, mark their bodies with black stains, called Amoco. In general the women stain only the lips, but sometimes mark other parts with black patches: the men on the contrary put on additional marks from year to year, so that those who are very ancient are almost covered. Exclusive of the amoco, they mark themselves with furrows. These furrows made a hideous appearance, the edges being indented, and the whole quite black. The ornaments of the face are drawn in the spiral form with equal elegance and correctness, both cheeks being marked exactly alike; while paintings on their bodies resemble fillagree work, and the foliage in old chased ornaments; but no two faces or bodies are painted exactly after the same model. The people of New Zealand, frequently left the breech free from these marks, which the inhabitants of Otaheite adorned beyond any other. These Indians likewise paint their bodies by rubbing them with red ocre, either dry or mixed with oil.

Their dress is formed of the leaves of the flag split into slips, which are interwoven and made into a kind of matting, the ends, which are seven or eight inches in length, hanging out on the upper side. One piece of this matting being tied over the shoulders, reaches to the knees: the other piece being wrapped round the waist falls almost to the ground. These two pieces are fastened to a string, which by means of a bodkin of bone is passed through, and tacks them together. The men wear the lower garment only at particular times.

They have two kinds of cloth besides the coarse matting or flag above-mentioned; one of which is as coarse, but beyond all proportion stronger than the English canvas; the other which is formed of the fibres of a plant, drawn into threads which cross and bind each other, resembles the matting on which we place our dishes at table.

They make borders of different colours to both these sorts of cloth, resembling girls samplers and finished with great neatness and elegance. What they consider as the most ornamental part of their dress is the fur of dogs, which they cut into stripes, and sew on different parts of their apparel. As dogs are not plenty, they dispose their stripes with economy. They have a few dresses ornamented with feathers; and one man was seen covered wholly with those of the red parrot.

The women never tie their hair on the top of their head, nor adorn it with feathers; and are less anxious about dress than the men. Their lower garment is bound tight round them, except when they go out fishing, and then they are careful that the men shall not see them. It once happened that some of the ship's crew surprised them in this situation, when some of them hid themselves among the rocks, and the rest kept their bodies under water till they had formed a girdle and apron of weeds; and their whole behaviour manifested the most refined ideas of female modesty.

The ears of both sexes were bored, and the holes stretched so as to admit a man's finger. The ornaments of their ears are feathers, cloth, bones, and sometimes bits of wood; a great many of them made use of

London: Published as the Act directs by Wm. Hogg at the Junks, St. James's Street.

NEW ZEALAND

A sepia-toned illustration of a large, ornate boat, possibly a traditional Chinese junk, sailing on a body of water. The boat features a high, decorated prow and stern with intricate carvings. Numerous figures are visible inside the boat, some standing and others seated, holding long poles or oars. The background shows a distant shoreline with hills and a cloudy sky. The entire scene is rendered in a classic, detailed style typical of 19th-century book illustrations.

of the nails which were given them by the English, for this purpose, and the women sometimes adorned their ears with white down of the albatross, which they spread before and behind the whole in a large bunch. They likewise hung to their ears by strings, chisels, bodkins, the teeth of dogs, and the teeth and nails of their deceased friends. The arms and ankles of the women are adorned with shells and bones, or any thing else through which they can pass a string. The men wear a piece of green tale or whalebone, with the resemblance of a man carved on it, hanging to a string round the neck. We saw one man who had the gristle of his nose perforated, and a feather passed through it, projecting over each cheek.

These people shew less ingenuity in the structure of their houses, than in any thing else belonging to them; they are from sixteen to twenty-four feet long, ten or twelve wide, and six or eight in height. The frame is of slight sticks of wood, and the walls and roof are made of dry grass pretty firmly compacted. Some of them are lined with bark of trees, and the ridge of the house is formed by a pole which runs from one end to the other. The door is only high enough to admit a person crawling on hands and knees, and the roof is sloping. There is a square hole near the door, serving both for window and chimney, near which is the fire place. A plank is placed over the door, adorned with a sort of carving, and this they consider as an ornamental piece of furniture. The side-walls and roof projecting two or three feet beyond the walls at each end form a sort of portico where benches are placed to sit on. The fire is made in the middle of a hollow square in the floor, which is inclosed with wood or stone. They sleep near the walls, where the ground is covered with straw for their beds. Some who can afford it, whose families are large, have three or four houses, inclosed in their court-yard. Their clothes, arms, feathers, some ill made tools, and a chest, in which all these are deposited, form all the furniture of the inside of the house. Their hammers to beat fern-root, gourds to hold water, and baskets to contain provisions, are placed without the house. One house was found near 40 feet long, 20 wide, and 14 high. Its sides were adorned with carved planks of workmanship superior to the rest; but the building appeared to have been left unfinished. Though the people sleep warm enough at home, they seem to despise the inclemency of the weather, when they go in search of fish or fern-roots. Sometimes, indeed, they place a small defence to windward, but frequently sleep undressed with their arms placed round them, without the least shelter whatever.

Besides the fern-root, which serves them for bread, they feed on albatrosses, penguins, and some other birds. Whatever they eat is either roasted or baked, as they have no vessel in which water can be boiled. We saw no plantations of cocoas, potatoes, and yams, to the southward, though there were many in the northern parts. The natives drink no other liquor than water, and enjoy perfect and uninterrupted health. When wounded in battle, the wound heals in a very short time without the application of medicine; and the very old people carry no other marks of decay about them than the loss of their hair, and teeth, and a failure of their muscular strength: but enjoy an equal share of health and cheerfulness with the youngest.

The canoes of this country are not unlike the whale-boats of New England, being long and narrow. The larger sort seem to be built for war, and will hold from 30 to 100 men. One of these at Tolaga measured near 70 feet in length, six in width, and four in depth. It was sharp at the bottom, and consisted of three lengths, about two or three inches thick, and tied firmly together with strong plaiting; each side was found of one entire plank, about twelve inches broad, and about an inch and a half thick, which was fitted to the bottom part with equal strength and ingenuity. Several thwarts were laid from one side to the other, to which they were securely fastened, in order to strengthen the canoes. Some few of their canoes at Mercury Bay and Opoorage, are all made entirely of one trunk of wood,

No. 7.

which is made hollow by fire; but by far the greater part are built after the plan above described. The smaller boats which are used chiefly in fishing, are adorned at head and stern with the figure of a man, the eyes of which are composed of white shells: a tongue of enormous size, is thrust out of the mouth, and the whole face a picture of the most absolute deformity. The grander canoes, which are intended for war, are ornamented with open work, and covered with fringes of black feathers, which gives the whole an air of perfect elegance; the side-boards which are carved in a rude manner, are embellished with tufts of white feathers. These vessels are rowed with a kind of paddles, between five and six feet in length, the blade of which is a long oval, gradually decreasing till it reaches the handle; and the velocity with which they row with these paddles is very surprising. Their sails are composed of a kind of mat or netting, which is extended between two upright poles, one of which is fixed on each side. Two ropes, fastened to the top of each pole, serve instead of sheets. The vessels are steered by two men having such a paddle, and sitting in the stern; but they can only sail before the wind, in which direction they move with considerable swiftness.

These Indians use axes, adzes, and chisels, with which last they likewise bore holes. The chisels are made of jasper, or of the bone of a man's arm; their axes and adzes of a hard black stone. They use their small jasper tools till they are blunted, and then throw them away, having no instrument to sharpen them with. The Indians at Tolaga having been presented with a piece of glass, drilled a hole through it, and hung it round the neck. A small bit of jasper was thought to have been the tool they used in drilling it.

Their tillage is excellent, owing to the necessity they are under of cultivating or running the risk of starving. At Tegadoo their crops were just put into the ground, and the surface of the field was as smooth as a garden, the roots were ranged in regular lines, and to every root there remained a hillock. A long narrow stake, sharpened to an edge at bottom, with a piece fixed across a little above it, for the convenience of driving it into the ground with the foot, supplies the place both of plough and spade. The soil being light, their work is not very laborious, and with this instrument alone they will turn up ground of six or seven acres in extent.

The seine, the large net which has been already noticed, is produced by the united labour, and is probably the joint property of a whole town. Their fish-hooks are of shell or bone; and they have baskets of wicker-work to hold the fish. Their warlike weapons are spears, darts, battle-axes, and the patoo-patoo. The spear, which is pointed at each end, is about sixteen feet in length, and they hold it in the middle, so that it is difficult to parry a push from it. Whether they fight in boats or on shore the battle is hand to hand, so that they must make bloody work of it. They trust chiefly in the patoo-patoo, which is fastened to their wrists, by means of a strong strap, that it may not be wrested out of their hands. These are worn in the girdles of people of a superior rank, as a military ornament. They have a kind of staff of distinction, which is carried by the principal warriors. It is formed of a whale's rib, is quite white, and adorned with carving, feathers, and the hair of their dogs. Sometimes they had a stick six feet long, inlaid with shells, and otherwise ornamented like a military staff. This honourable mark of distinction was commonly in the hands of the aged, who were also more daubed with the anaco.

When they came to attack us, one or more of these old men thus distinguished, were usually in each canoe. It is their custom to stop about 50 or 60 yards from a ship, when the chiefs rising from their seat, put on a dog's skin garment, and, holding out their decorated staff, direct them how to proceed. When they were too far from the ship to reach it with their missile weapons, then the defiance was given, and the words usually were Karonai, haronai, harre uta a patoo-patoo.

P

too.

too. "Come on shore, come on shore, and we will kill you all with our patoo patoos." While they thus threatened us, they approached gradually the bark, till close along-side; yet talking at intervals in a peaceable manner, and answering whatever questions we asked them. Then again their menaces were renewed, till encouraged by our supposed timidity, they began the war-song and dance, the sure prelude of an attack, which always followed, and sometimes continued until the firing of small shot repulsed them; but at others, they vented their passion, by throwing a few stones at the ship, in the way of insulting us.

The contortions of these savage Indians are numerous; their limbs are distorted, and their faces are agitated with strange convulsive motions. Their tongue hangs out of their mouths to an amazing length, and their eye-lids are drawn so as to form a circle round the eye. At the same time they shake their darts, brandish their spears, and wave their patoo-patoos to and fro in the air. There is an admirable vigour and activity in their dancing; and in their song they keep time with such exactness, that 60 or 100 paddles when struck against the sides of their boats at once, make only a single report. In times of peace they sometimes sing in a manner resembling the war-song, but the dance is omitted. The women, whose voices are exceeding melodious and soft, sing likewise in a musical, but mournful manner. One of their instruments of music is a shell, from which they produce a sound not unlike that made with a common horn; the other is a small wooden pipe, resembling a child's nine-pin, not superior in sound to a child's whistle. We never heard them attempt to sing to them, or to produce any measured notes like what we call a tune.

As to the horrid custom of eating human flesh, prevalent among them, to what has been already said on this head, we shall only add, that in most of the coves, upon landing, we found near the places where fires had been made, flesh bones of men; and among the heads that were brought on board, some of them had a kind of false eyes, and ornaments in their ears, as if alive. The head purchased by Mr. Banks, and sold with great reluctance, was that of a young person, and, by the contusions on one side, appeared to have received many violent blows. There had been lately a skirmish, and we supposed the young man had been killed with the rest.

The hippahs or villages of these people, of which there are several between the bay of Plenty and Queen Charlotte's sound, are all fortified. In these they constantly reside; but near Tolaga, Hawk's Bay, and Poverty Bay, only single houses are to be seen, at a considerable distance from each other. On the sides of the hills were erected long stages, supplied with darts and stones, thought by us to be retreats in time of action; as it appeared that from such places they could combat with their enemies to great advantage. A magazine of provisions, consisting of dried fish, and fern roots, was also discovered in these fortifications.

The inhabitants of this part of the country were all subjects of Teratu, who resided near the bay of Plenty; and to their being thus united under one chief, they owed a security unknown to those of other parts. Several inferior governors are in the dominions of Teratu, to whom the most implicit obedience is paid. One of the inhabitants having robbed a sailor belonging to the Endeavour, complaint was made to a chief, who chastized the thief by kicking and striking him, which correction he bore with unresisting humility. The inhabitants of the southern parts formed little societies, who had all things in common, particularly fishing nets and fine apparel. The latter, probably obtained in war, were kept in a little hut, destined for that use, in the center of the town, and the several parts of the nets, being made by different families, were afterwards joined together for public use. Let's account, in the opinion of Tupia, is made of the women here than in the South Sea islands. Both sexes eat together; but how they divide their labour, we cannot determine with certainty, though we are inclined to believe that the

men cultivate the ground, make nets, catch birds, and go out in their canoes to fish; while the women are employed in weaving cloth, collecting shell-fish, and in dressing food.

As to the religion of these people, they acknowledge one Supreme Being, and several subordinate deities. Their mode of worship we could not learn, nor was any place proper for that purpose seen. There was indeed a small square area, encompassed with stones, in the middle of which hung a basket of fern-roots on one of their spades. This they said was an offering to their gods, to obtain from them a plentiful crop of provisions. They gave the same account of the origin of the world, and the production of mankind, as our friends in Otaheite. Tupia, however, seemed to have much more deep and extensive knowledge of these subjects than any of the people of this island, and when he sometimes delivered a long discourse, he was sure of a numerous audience, who heard with remarkable reverence and attention.

With regard to the manner of disposing of their dead, we could form no certain opinion. The southern district said, they disposed of their dead by throwing them into the sea; but those of the north buried them in the ground. We saw, however, not the least sign of any grave or monument; but the body of many among the living, bore the marks of wounds, in token of grief for the loss of their friends and relations. Some of their scars were newly made, a proof that their friends had died while we were there; yet no one saw any thing like a funeral ceremony or procession, the reason is, because they affected to conceal every thing respecting the dead with the utmost secrecy.

We observed a great similitude between the dress, furniture, boats, and nets of the New Zealanders, and the natives of the South Sea islands, which evidently demonstrates that the common ancestors of both were *ab origine* natives of the same country. Indeed the inhabitants of these different places have a tradition, that their ancestors sprang from another country many years since, and they both agree that this country was called Heawige. This is also certain, that Tupia when he addressed the people here in the language of his own country, was perfectly understood; but perhaps a yet stronger proof that their origin was the same, will arise from a specimen of their language, which we shall evince by a list of words in both languages, according to the dialect of the northern and southern islands of which New Zealand consists; whence it will appear, that the language of Otaheite does not differ more from that of New Zealand, than the language of the two islands from each other.

THE LANGUAGE OF

NEW ZEALAND.		OTAHEITE.	ENGLISH.
Northern.	Southern.		
Eareete	Eareete	Earee	<i>A chief.</i>
Taata	Taata	Taata	<i>A man.</i>
Whahine	Whahine	Ivahine	<i>A woman.</i>
Eupo	Heaowpoho	Eupo	<i>The head.</i>
Macauwe	Heoo-oo	Roourou	<i>The hair.</i>

Toubouna	Toubouna	Toubouna	Grandfather.
Owy Terra	—	Owy Terra	What do you call this or that.

Hence it appears evidently that the language of New Zealand and Otaheite, is radically one and the same. The dialect indeed is different as in England, where the word is pronounced *gate* in Middlesex, and *geate* in Yorkshire; and as the northern and southern words were taken down by two different persons, one might possibly use more words than the other to express the same sound. Besides, in the southern parts they put the articles *he* or *ko* before a noun, as we do those of *the* or *a*: it is also common to add the word *oeia* after another word, as we say *certainly*, or *yes indeed*; and by not attending sufficiently to this, our gentlemen sometimes, judging by the ear only, formed words of an enormous length: for example, one of them asking a native the name of the island, called Matuaro, he replied, with the particle *ke* prefixed *Ke-matuaro*; and upon the question being repeated, the Indian added *oeia*, which made the word *Ke-matuaro-oeia*; and upon inspecting the log-book, Capt. Cook found Matuaro

transformed into *Cumettiwarrowoeia*. Now a similar orthographical difference might happen, or a like mistake might be made by a foreigner in writing an English word. Suppose a New Zealander to enquire, when near to ask, *What village is this?* The answer might be, *It is Hackney indeed.* The Indian then for the information of his countrymen, had he the use of letters, might record, that he had passed through, or been at a place called by the English *Hackneyindeed*. We were ourselves at first led into many ridiculous mistakes, from not knowing that the article used in the South-Sea Islands, is *to* or *ta*, instead of *ke* or *ko*.

We have supposed, that the original inhabitants of these islands, and those in the South-Seas, came from the same country; but what country that is, or where situated, remains still a subject of enquiry. In this we all agreed, that the original natives were not of America, which lies to the eastward; and unless there should be a continent to the southward, in a temperate latitude, we cannot but conclude that they emigrated from the westward.

Before we close this account of New Zealand, we beg leave further to observe, that hitherto our navigation has been very unfavourable to the supposition of a Southern Continent. The navigators who have supported the positions upon which this is founded, are Tasman, Juan Fernandes, Hermite, Quiros, and Roggewein; but the track of the Endeavour has totally subverted all their theoretical arguments. Upon a view of the chart it will appear, that a large space extends quite to the tropics, which has not been explored by us nor any other navigators; yet we believe there is no cape of any Southern Continent, and no Southern Continent to the northward of 40 deg. south. Of what may lie farther to the southward of 40 deg. we can give no opinion; yet are far from discouraging any future attempts after new discoveries: for a voyage like this may be of public utility. Should no continent be found, new islands within the tropics may be discovered. Tupia in a rough chart of his own drawing laid down no less than seventy-four; and he gave us an account of above one hundred and thirty, which no European vessel has ever yet visited.

C H A P. VIII.

Passage from New Zealand to Botany Bay, in New Holland—Various incidents related—A description of the country and its inhabitants—The Endeavour sails from Botany Bay to Trinity Bay—With a further account of the country—Her dangerous situation in her passage from Trinity Bay to Endeavour River.

ON Saturday the 31st of March, 1770, we sailed from Cape Farewell, having fine weather and a fair wind. This cape lies in latitude 40 deg. 33 min. S. and in 186 deg. W. longitude. The same day we steered westward, with a fresh gale till the 2nd of April, when by observation we found our latitude to be 40 deg. and our longitude from Cape Farewell, 2 deg. 31 min. W. On the ninth in the morning, when in latitude 38 deg. 29 min. S. we saw a tropic bird, a sight very unusual in so high a latitude. On the 15th we saw an egg bird, and a gannet. As these birds never go far from land, we sounded all night, but had no ground at 130 fathom water. The day following a small land bird perched on the rigging, but we had no ground at 120 fathoms. Tuesday the 17th, we had fresh gales with squalls and dark weather in the morning; and in the afternoon a hard gale and a great sea from the southward, which obliged us to run under our fore-sail and mizen all night. On the 18th in the morning, we were visited by a pintado bird, and some Port-Egmont hens, an infallible sign that land was near, which we discovered at six o'clock in the morning of the 19th, four or five leagues distant. To the southernmost point in sight, we gave the name of Point Hicks, the name of our first lieutenant who discovered it. At noon, in latitude 37 deg. 5 min. and 210 deg. 29 min. W. longitude, another remarkable point of the same

land bore N. 25 E. distant about four leagues. This point rising in a round hillock, extremely like the Ram Head at the entrance of Plymouth Sound, Capt. Cook therefore gave it the same name. What we had yet seen of the land was low and level; the shore white and sandy; and the inland parts covered with wood and verdure. At this time we saw three water-spouts at once; two between us and the shore, and the third at some distance upon our larboard quarter. In the evening, at six o'clock, the northernmost point of land was distant about two leagues, which we named Cape Howe. On the following day we had a distant view of the country, which was in general covered with wood, and interspersed with several small lawns. It appeared to be inhabited, as smoke was seen in several places. At four o'clock the next morning, we saw a high mountain, which from its shape, was called Mount Dromedary, under which there is a point which received the name of Point Dromedary. In the evening we were opposite a point of land which rose perpendicular, and was called Point Upright. On Sunday the 22d, we were so near the shore, as to see several of the inhabitants on the coast, who were of a very dark complexion, if not perfect negroes. At noon we saw a remarkable peaked hill, to which the captain gave the name of the Pigeon House, from its resemblance of such a building. The trees on this island were both tall and large, but

but we saw no place fit to give shelter even to a boat.

The captain gave the name of Cape George to a point of land discovered on St. George's-day, two leagues to the north of which the sea formed a bay, which, from its shape, was called Long Nose; eight leagues from which lies Red Point, so called from the colour of the soil in its neighbourhood. On the 27th, we saw several inhabitants walking along the shore, four of them carrying a canoe on their shoulders, but as they did not attempt to come off to the ship, the captain took Messrs. Banks and Solander, and Tupia in the yawl, and employed four men to row them to that part of the shore where they saw the natives, near which four small canoes laid close in land. The Indians sat on the rocks till the yawl was a quarter of a mile from the shore, and then they ran away into the woods. The surf beating violently on the beach, prevented the boat from landing; the gentlemen were therefore obliged to make what observations they could at a distance. The canoes resembled generally the smaller sort of those of New Zealand. They saw a great number of cabbage trees on shore; the other trees were of the palm kind, and there was no underwood among them. At five in the evening they returned to the ship, and a light breeze springing up, we sailed to the northward, where we discovered several people on shore, who, on our approach, retired to an eminence, soon after which two canoes arrived on the shore, and four men, who came in them, joined the others. The pinnace having been sent ahead to sound, arrived near the spot where the Indians had stationed themselves, on which one of them hid himself among the rocks near the landing place, and the others retreated farther up the hill. The pinnace keeping along shore, the Indians walked near in a line with her; they were armed with long pikes, and a weapon resembling a scymitar, and, by various signs and words, invited the boat's crew to land; those who did not follow the boat, having observed the approach of the ship, brandished their weapons, and threw themselves into threatening attitudes. The bodies, thighs, and legs of two of these, were painted with white streaks, and their faces were almost covered with a white powder. They talked together with great emotion, and each of them held one of the above mentioned weapons. The ship having come to an anchor, we observed a few huts, in which were some of the natives; and saw some canoes, in each of which was a man employed in striking fish with a kind of spear. We had anchored opposite a village of about eight houses, and observed an old woman and three children come out of a wood, laden with fuel for a fire; they were met by three smaller children, all of whom, as well as the woman, were quite naked. The old woman frequently looked at the ship with the utmost indifference, and, as soon as she had made a fire, the fishermen brought their canoes on shore, and they set about dressing their dinner with as much composure, as if a ship had been no extraordinary sight. Having formed a design of landing, we manned the boats, and took Tupia with us, and we had no sooner come near the shore, than two men advanced, as if to dispute our setting foot on land. They were each of them armed with different kinds of weapons. They called out aloud in a harsh tone, warra warra wai! the meaning of which Tupia did not understand. The captain threw them beads, nails, and other trifles, which they took up, and seemed very well pleased with. He then made signals that he wanted water, and used every possible means to convince them that no injury was intended. They made signs to the boat's crew to land, on which we put the boat in, but we had no sooner done so, than the two Indians came again to oppose us. A musquet was now fired between them, on the report of which, one of them dropped a bundle of lances, which he immediately snatched up again in great haste. One of them then threw a stone at the boat, on which the captain ordered a musquet loaded with small shot to be fired, which wounding the eldest of them on the legs, he retired hastily to one of the houses, that stood at some little distance. The people in

the boats now landed, imagining that the wound which this man had received would put an end to the contest. In this, however, we were mistaken, for he immediately returned with a kind of shield, of an oval figure, painted white in the middle, with two holes in it to see through. They now advanced with great intrepidity, and both discharged their lances at the boat's crew, but did not wound any of them. Another musquet was fired at them, on which they threw another lance, and then took to their heels. We now went up to the huts, in one of which we found the children, who had secreted themselves behind some bark. We looked at them, but left them without its being known we had seen them, and having thrown several pieces of cloth, ribbands, beads, and other things into the hut, we took several of their lances, and then reembarked in the boat. The canoes on this coast were about 13 feet in length, each made of the bark of a single tree, tied up at the ends, and kept open in the middle by the means of sticks placed across them; their paddles were very small, and two were used at a time.

We now sailed to the north point of the bay, and found plenty of fresh water. On taking a view of the hut where we had seen the children, we had the mortification to find that every Indian was fled, and that they had left all the presents behind them. The captain now went in the pinnace to inspect the bay, and saw several of the natives, who all fled as he approached them. Some of the men having been sent to get wood and water, they no sooner went on board to dinner, than the natives came down to the place, and examined the casks with great attention, but did not offer to remove them. When the people were on shore in the afternoon, about 20 of the natives, all armed, advanced within a trifling distance of them, and then stopped, while two of their number approached still nearer. Mr. Hicks, the commanding officer on shore, went towards them, with presents in his hands, and endeavoured, by every possible means to assure them of his friendly intentions, but to no purpose, for they retired before he came up to them. In the evening, Messrs. Banks and Solander, went with the captain to a cove north of the bay, where they caught between three and four hundred weight of fish, at four hauls.

On Monday the 30th, the natives came down to the huts before it was light, and were repeatedly heard to shout very loud, and soon after day-break they were seen on the beach, but quickly retired about a mile, and kindled several fires in the woods. This day some of the ship's crew being employed in cutting grass at a distance from the main body, while the natives pursued them, but stopping within fifty or sixty yards of them, they shouted several times, and retreated to the woods. In the evening they behaved exactly in the same manner, when the captain followed them alone and unarmed for some time, but they still retired as he approached.

On Tuesday, May the first, the south point of the bay was named Sutherland Point, one of the seamen of the name of Sutherland, having died that day, was buried on shore; and more presents were left in the huts, such as looking-glasses, combs, &c. but the former ones had not been taken away. Making an excursion about the country, we found it agreeably variegated with wood and lawn, the trees being strait and tall, and without underwood. The country might be cultivated without cutting down one of them. The grass grows in large tufts, almost close to each other, and there is a great plenty of it. In this excursion, we met with many places where the inhabitants had slept without shelter, and one man, who ran away the moment he beheld us. More presents were left in their huts, and at their sleeping-places, in hopes of producing a friendly intercourse. We saw the dung of an animal which fed on grass, and traced the foot-steps of another, which had claws like a dog, and was about the size of a wolf: also the track of a small animal, whose foot was like that of a pole-cat; and saw one animal alive, about the size of a rabbit. We found some wood that had been felled, and the bark stripped off

by the natives, and several growing trees, in which steps had been cut, for the convenience of ascending them. The woods abound with a vast variety of beautiful birds, among which were cockatoos, and paroquets, which flew in large flocks. The second lieutenant, Mr. Gore, having been with a boat in order to drudge for oysters, saw some Indians, who made signs for him to come on shore, which he declined: having finished his business, he sent the boat away, and went by land with a midshipman, to join the party that was getting water. In their way they met with more than 20 of the natives, who followed them so close as to come within a few yards of them; Mr. Gore stopped and faced them, on which the Indians stopped also, and when he proceeded again, they followed him; but they did not attack him though they had each man a lance. The Indians coming in sight of the water-casks, stood at the distance of a quarter of a mile, while Mr. Gore and his companions reached their ship-mates in safety. Two or three of the waterers now advanced towards the Indians, but observing they did not retire, they very imprudently turned about, and retreated hastily: this apparent sign of cowardice inspired the savages, who discharged four of their lances at the fugitives, which flying beyond them, they escaped unhurt. They now stopped to pick up the lances; on which the Indians retired in their turn. At this instant the captain came up with Messrs. Banks and Solander, and Tupia advancing made signs of friendship; but the poor natives would not stay their coming up to them. On the following day they went again on shore, where many plants were collected by Dr. Solander, and Mr. Banks. They saw several parties of the Indians, who all ran away on their approach. Tupia having learnt to shoot, frequently stayed alone to shoot parrots, and the Indians constantly fled away from him with as much precipitation as from the English. On the 3d of May, fourteen or fifteen Indians, in the same number of canoes, were engaged in striking fish within half a mile of the watering-place. At this time a party of the ship's crew were shooting near the fishermen, one of whom Mr. Banks observed to haul up his canoe on the beach, and approach the people who were shooting. He watched their motions unobserved by them, for more than a quarter of an hour, then put off his boat and returned to his fishing. At this time the captain, with Dr. Solander and another gentleman, went to the head of the bay to try to form some connection with the Indians. On their first landing they found several of the Indians on shore, who immediately retreated to their canoes, and rowed off. They went up the country, where they found the soil to be a deep black mould, which appeared to be calculated for the production of any kind of grain. They saw some of the finest meadows that were ever beheld, and met with a few rocky places, the stone of which is sandy, and seemed to be admirably adapted for building. In the woods they found a tree bearing cherries, if shape and colour may intitle them to that name, the juice of which was agreeably tart. They now returned to their boat, and seeing a fire at a distance, rowed towards it; but the Indians fled at their coming near them. Near the beach they found seven canoes, and as many fires, from which they judged that each fisherman had dressed his own dinner. There were oysters lying on the spot, and some muscles roasting on the fire. They ate of these fish, and left them some beads and other trifles in return. They now returned to the ship, and in the evening Mr. Banks went out with his gun, and saw a great number of quails, some of which he shot, and they proved to be the same kind as those of England. On the following day a midshipman having stayed from his companions, came suddenly to an old man and woman, and some children, who were sitting naked under a tree together: they seemed afraid of him, but did not run away. The man wore a long beard, and both he and the women were grey-headed; but the woman's hair was cut short. This day likewise, two of another party met with six Indians on the border of a wood, one of whom calling out very loud, a lance was thrown

from a wood, which narrowly missed them. The Indians now ran off, and, in looking round they saw a youth descend from a tree, who had doubtless been placed there for the purpose of throwing the lance at them. This day the captain went up the country on the north side of the bay, which he found to resemble the moory grounds of England; but the land was thinly covered with plants about 16 inches high. The hills rise gradually behind each other, for a considerable distance, and between them is marshy ground. Those who had been sent out to fish this day, met with great success, and the second lieutenant struck a fish called the Stingray, which weighed near two hundred and fifty pounds. The next morning a fish of the same kind was taken, which weighed three hundred and fifty pounds. The name of Botany Bay was given to this place from the large number of plants collected by Messrs. Banks and Solander. This country produces two kinds of wood which may be deemed timber, one of which is tall and strait like the pine, and the other is hard, heavy, and dark-coloured, like *lignum vitæ*; it yields a red gum, like dragon's blood, and bears some resemblance of the English oak. There are mangroves in abundance, several kinds of palm, and a few shrubs. Among other kinds of birds, crows were found here, exactly like those of England. There is great plenty of water-fowls, among the flats of sand and mud; one of which is shaped like a pelican, is larger than a swan, and has black and white feathers. These banks of mud abound with cockles, muscles, oysters, and other shell-fish, which greatly contribute towards the support of the natives, who sometimes dress them on shore, and at other times in their canoes. They likewise caught many other kinds of fish with hooks and line.

While the captain remained in the harbour, the English colours were displayed on shore, daily, and the name of the ship, with the date of the year, was carved on a tree near the place where we took in our water.

On Sunday the 6th of May, at noon, we sailed from Botany Bay, and at noon, were off a harbour, which was called Port Jackson, and in the evening, near a bay, to which we gave the name of Broken Bay. The next day at noon, the northernmost land in sight projected so as to justify the calling it Cape Three Points. On Wednesday the 9th, we saw two exceeding beautiful rainbows, the colours of which were strong and lively, and those of the inner one so bright, as to reflect its shadow on the water. They formed a complete semicircle, and the space between them was much darker than the rest of the sky. On Thursday we passed a rocky point, which was named Point Stephens. Next day saw smoke in several places on shore, and in the evening discovered three remarkable high hills near each other, which the captain named the Three Brothers. They lie in latitude 31 deg. 40. min. and may be seen thirteen or fourteen leagues from the shore.

Sunday, the 13th, we saw the smoke of fires, on a point of land, which was therefore called Cape Smokey. As we proceeded from Botany Bay, northward, the land appeared high and well covered with wood. In the afternoon, we discovered some rocky islands between us and the land, the southernmost of which is in latitude 30 deg. 10 min. and the northernmost in 29 deg. 58 min. On Tuesday morning, by the assistance of our glasses, we discerned about a score of Indians, each loaded with a bundle, which we imagined to be palm leaves for covering their houses. We traced them for more than an hour, during which time they took not the least notice of the ship; at length they left the beach, and were lost behind a hill, which they gained by a gentle ascent. At noon, in latitude 28 deg. 37 min. 30 sec. south, and in 206 deg. 30 min. west longitude, the Captain discovered a high point of land, and named it Cape Byron. We continued to steer along the shore with a fresh gale, and in the evening we discovered breakers at a considerable distance from the shore, so that we were obliged to tack, and

get into deeper water; which having done, we lay with the head of the vessel to the land till the next morning, when we were surprized to find ourselves farther to the southward than we had been the preceding evening, notwithstanding we had a southerly wind all night. The breakers lie in latitude 28 deg. 22 min. south. In the morning we passed the breakers, near a peaked mountain, which we named Mount Warning, situated in 28 deg. 22 min. south latitude. The point off which these shoals lie, Capt. Cook named Point Danger. We pursued our course, and the next day saw more breakers, near a point, which we distinguished by the name of Point Look-out; to the north of which the shore forms a wide open bay, which we called Moreton's Bay, and the north point thereof Cape Moreton. Near this are three hills, which we called the Glass Houses, from the very strong resemblance they bore to such buildings.

On Friday, the 18th, at two in the morning, we descried a point so unequal, that it looks like two small islands under the land, and it was therefore called Double Island Point. At noon, by the help of glasses, we discovered some sands, which lay in patches of several acres. We observed they were moveable, and that they had not been long in their present situation; for we saw trees half buried, and the tops of others still green. At this time two beautiful water-snakes swam by the ship, in every respect resembling land snakes, except that their tails were flat and broad, probably to serve them instead of fins in swimming.

Saturday, the 19th at noon, we sailed about four leagues from the land, and at one o'clock saw a point, whereon a number of Indians were assembled, from whence it was called Indian Head. Soon afterwards we saw many more of the natives; also smoke in the day time, and fires by night. The next day we saw a point, which was named Sandy Point, from two large tracts of white sand that were on it. Soon after we passed a shoal, which we called Break Sea Spit, because we had now smooth water, after having long encountered a high sea. For some days past we had seen the sea birds, called boobies, none of which we had met with before; and which, from half an hour after, were continually passing the ship in large flights: from which it was conjectured, that there was an inlet or river of shallow water to the southward, where they went to feed in the day time, returning in the evening to some islands to the northward. In honour of Capt. Hervey we named this bay, Hervey's Bay.

On Tuesday, the 22nd, at six in the morning, by the help of our glasses, when a-breast of the fourth point of a large bay, in which the Captain intended to anchor, we discovered, that the land was covered with palm-nut-trees, none of which we had seen since we had quitted the islands within the tropic. On the 23d, early in the morning, Capt. Cook attended by several gentlemen, and Tupia, went on shore to examine the country. The wind blew so fresh, and we found it so cold, that being at some distance from the shore, we took with us our cloaks. We landed a little within the point of a bay, which led into a large lagoon, by the sides of which grows the true mangrove, such as is found in the West-Indies, as it does also on some bogs, and swamps of salt water which we discovered. In these mangroves were many nests of ants of a singular kind, being as green as grass. When the branches were moved, they came forth in great numbers, and bit the disturber most severely. These trees likewise afforded shelter for immense numbers of green caterpillars, whose bodies were covered with hairs, which, on the touch, occasioned a pain similar to the sting of a nettle, but much more acute. These insects were ranged side by side on the leaves, thirty or forty together, in a regular manner. Among the sand-banks we saw birds larger than swans, which we imagined were pelicans; and shot a kind of bustard, which weighed seventeen pounds. This bird proved very delicate food, on which account we named this bay Bustard Bay. We likewise shot a duck of a most beautiful plumage, with a white beak. We found an abundance

of oysters, of various sorts, and among the rest some hammer oysters of a curious kind. The country here is much worse than that about Botany Bay, the soil being dry and sandy, but the sides of the hills are covered with trees, which grow separately without underwood. We saw the tree that yields a gum like the *sanguis draconis*, but the leaves are longer than the same kind of trees in other parts, and hang down like those of a weeping willow. While we were in the woods, several of the natives took a survey of the ship and then departed. We saw on shore fires in many places, and repairing to one of them, found a dozen burning near them. The people were gone, but had left some shells and bones of fish they had just eaten. We perceived likewise several pieces of soft bark about the length and breadth of a man, which we judged had been used as beds. The whole was in a thicket of close trees, which afforded good shelter from the wind. This kind of encampment was in a thicket well defended from the wind. The place seemed to be much trodden, and as there was no appearance of a house, it was imagined that they spent their nights, as well as their days in the open air: even Tupia shook his head, and exclaimed, Taata Enos! "Poor Wretches!"

On Thursday, the 24th, we made sail out of the bay, and on the day following were a-breast of a point, which being immediately under the tropic, the captain named Cape Capricorn. on the west side whereof we saw an amazing number of large birds resembling the pelican, some of which were near five feet high. We now anchored in twelve fathom water, having the main land and barren islands in a manner all round us.

Sunday, the 27th, we stood between the range of almost barren islands, and the main land, which appeared mountainous. We had here very shallow water, and anchored in sixteen feet, which was not more than the ship drew. Mr. Banks tried to fish from the cabin windows, but the water was too shallow. The ground indeed was covered with crabs, which greedily seized the bait, and held it till they were above water. These crabs were of two kinds, one of a very fine blue, with a white belly; and the other marked with blue on the joints, and having three brown spots on the back.

On Monday, the 28th, in the morning, we sailed to the northward, and to the northernmost point of land we gave the name of Cape Manifold, from the number of high hills appearing above it. Between this cape and the shore is a bay which we called Keppel's, and to several islands, we gave the name of the same admiral. This day being determined to keep the main land close aboard, which continued to trend away to the west, we got among another cluster of islands. Here we were greatly alarmed, having on a sudden but three fathom water, in a rippling tide; we immediately put the ship about, and hoisted out the boat in search of deeper water; after which we stood to the west with an easy sail, and in the evening came to the entrance of a bay. In the afternoon, having sounded round the ship, and found that there was water sufficient to carry her over the shoal, we weighed, and stood to the westward, having sent a boat a-head to sound, and at six in the evening we anchored in ten fathom, with a sandy bottom, at about two miles distant from the main.

On Tuesday the 29th, we had thoughts of laying the ship all ore, and cleaning her bottom, and therefore landed with the master in search of a convenient place for that purpose. In this excursion Dr. Solander and Mr. Banks accompanied us; we found walking extremely inconvenient, the ground being covered with grass, the seeds of which were sharp and bearded, so that they were continually sticking in our cloaths, whence they worked forwards to the flesh by means of the beard. We were also perpetually tormented with the stings of musqueros. Several places were found convenient to lay down the ship ashore, but to our great disappointment, we could meet with no fresh water. We proceeded, however, up the country, and in the interior parts, we found gum-trees, on the branches whereof were white ants nests formed of clay, as big as a bushel. On another tree we saw black ants, which

which perforated all the twigs, and after they had eaten out the pith, formed their lodging in the hollows which contained it; yet the trees were in a flourishing condition. We also saw in the air many thousands of butterflies, which ever way we looked; and every bough was covered with incredible numbers. On the dry ground we discovered, supposed to have been left by the tide, a fish about the size of a minnow, having two strong breast fins, with which it leaped away as nimbly as a frog: it did not appear to be weakened by being out of the water, nor even to prefer that element to the land, for when seen in the water it leaped on shore, and pursued its way. It was likewise remarked, that where there were small stones projecting above the water, it chose rather to leap from one stone to another, than to pass through the water.

On Wednesday the 30th Capt. Cook, and other gentlemen, went ashore, and having gained the summit of a hill, took a survey of the coast, and the adjacent islands, which being done, the Captain proceeded with Dr. Solander up an inlet, that had been discovered the preceding day; but the weather proving unfavourable, and from a fear of being bewildered among the shoals in the night, they returned to the ship, having seen the whole day, only two Indians, who followed the boat a considerable way along shore; but the tide running strong, the Captain thought it not prudent to wait for them. While these gentlemen were tracing the inlet, Mr. Banks, with a party, endeavoured to penetrate into the country, and having met with a piece of swampy ground, we resolved to pass it; but before we got half way, we found the mud almost knee deep. The bottom was covered with branches of trees, interwoven on the surface of the swamp, on which we sometimes kept our footing; sometimes our feet slipped through; and sometimes we were so entangled among them, as not to be able to free ourselves but by groping in the mud and slime with our hands. However, we crossed it in about an hour, and judged it might be about a quarter of a mile over. Having performed this disagreeable task, we came to a spot, where had been four small fires, near which were some bones of fish that had been roasted; also grass laid in heaps, whereon four or five persons probably had slept. Our second lieutenant, Mr. Gore, at another place, saw the track of a large animal, near a gully of water; he also heard the sounds of human voices, but did not see the people. At this place two turtles, some water fowl, and a few small birds, were seen. As no water was to be found in our different excursions, for several of our crew were also rambling about, the Captain called the inlet where the ship lay, Thirsty Sound. It lies in latitude 22 deg. 10 min. south, and in 210 deg. 18 min. west longitude, and may be known by a group of islands that lie right before it, between three and four leagues out at sea. We had not a single inducement to stay longer in a place, where we could not be supplied with fresh water, nor with provision of any kind. We caught neither fish nor wild fowl; nor could we get a shot at the same kind of water-fowl, which we had seen in Botany Bay. Therefore on the 31st at six o'clock, A. M. we weighed anchor, and put to sea. We kept without the islands that lie in shore, and to the N. W. of Thirsty Sound, as there appeared to be no safe passage between them and the main, at the same time we had a number of islands without us, extending as far as we could see. Pier head, the N. W. point of Thirsty Sound, bore S. E. distant six leagues, being half way between the islands which are off the east point of the western inlet, and three small islands that lie directly without them. Having sailed round these last, we came to an anchor in fifteen fathom water, and the weather being dark, hazy, and rainy, we remained under the lee of them till seven o'clock of the next morning.

On the 1st of June, we got under sail, and our latitude by observation was 21 deg. 29 min. south. We had now quite open the western inlet, which we have distinguished by the name of Broad Sound. A point of land which forms its N. W. entrance, we named Cape Palmerston, lying in 21 deg. 30 min. S. latitude, and

in 210 deg. 54 min. W. longitude. Between this cape and Cape Townshend is the bay, which we have called the Bay of Inlets. At eight in the evening, we anchored in eleven fathom, with a sandy bottom, about two leagues from the main land.

Saturday the 2nd, we got under sail, and at noon, in latitude 20 deg. 56 min. we saw a high promontory, which we named Cape Hillsborough. It bore W. half N. distant seven miles. The land appeared to abound in wood and herbage, and is diversified with hills, plains, and vallies. A chain of islands large and small are situated at a distance from the coast and under the land, from some of which we saw smoke ascending in different places.

On Sunday, the 3d, we discovered a point of land, which we called Cape Conway, and between that and Cape Hillsborough, a bay to which we gave the name of Repulse Bay. The land about Cape Conway forms a most beautiful landscape, being diversified with hills; sales, woods, and verdant lawns. By the help of our glasses we discovered two men and a woman on one of the islands, and a canoe with an outrigger like those of Otaheite. This day we named the islands Cumberland Islands, in honour of the duke; and a passage which we had discovered, was called Whitunday passage, from the day on which it was seen. At day-break, on Monday the 4th, we were abreast of a point, which we called Cape Gloucester. Names were also given this day to three other places, namely, Holborne Isle, Edgumbe Bay, and Cape Upstart, which last was so called because it rises abruptly from the low lands that surround it. Inland are some hills or mountains, which, like the cape afford but a barren prospect.

On Tuesday the 5th, we were about four leagues from land, and our latitude by observation was 19 deg. 12 min. S. We saw very large columns of smoke rising from the low lands. We continued to steer W. N. W. as the land lay, till noon on the 6th, when our latitude by observation was 19 deg. 1 min. S. at which time we had the mouth of a bay all open, distant two leagues. This we named Cleveland Bay; and the east point Cape Cleveland. The west, which had the appearance of an island, we called Magnetical island, because the compass did not traverse well when we were near it: they are both high, as is the main land between them, the whole forming a surface the most rugged, rocky, and barren of any we had seen upon the coast: yet it was not without inhabitants, for we saw smoke in several parts of the bottom of the bay.

Thursday the 7th, at day-break we were a-breast of the eastern part of this land, and in the afternoon saw several large columns of smoke upon the main; also canoes, and some trees, which we thought were those of the cocoa-nut: in search of which, as they would have been at this time very acceptable, Mr. Banks and Dr. Solander went ashore with lieutenant Hicks; but in the evening they returned with only a few plants, gathered from the cabbage-palm, and which had been mistaken for the cocoa tree.

On Friday, the 8th we stood away for the northernmost point in sight, to which we gave the name of Point Hillock. Between this and Magnetical Isle the shore forms Halifax Bay, which affords shelter from all winds. At six in the evening we were a-breast of a point of land, which we named Cape Sandwich. From hence the land trends W. and afterwards N. forming a fine large bay, which was named Rockingham Bay. We now ranged northward along the shore, towards a cluster of islands, on one of which about forty or fifty men, women, and children were standing together, all stark naked, and looking at the ship with a curiosity never observed among these people before. At noon our latitude, by observation, was 17 deg. 59 min. and we were a-breast of the north point of Rockingham Bay, which bore from us W. distant about two miles. This boundary of the bay is formed by an island of considerable height, which we distinguished by the name of Dunk Isle.

On Saturday, the 9th, in the morning, we were a-breast of some small islands, which were named Frank-

Frankland's Isles. At noon we were in the middle of the channel, and by observation in latitude 16 deg. 57 min. S. and in longitude 214 deg. 6 min. W. with twenty fathom water. The point on the main of which we were now abreast Capt. Cook named Cape Grafton. Having hauled round this, we found a bay three miles to the westward, in which we anchored; and called the island Green Island. Here Mr. Banks and Dr. Solander went ashore with the captain, with a view of procuring water, which not being to be had easily, they soon returned aboard, and the next day we arrived near Trinity Bay, so called because discovered on Trinity Sunday.

Sunday the 10th was remarkable for the dangerous situation of the Endeavour, as was Tuesday the 12th; for her preservation and deliverance, as christians, or only moral philosophers, we ought to add, agreeable to the will of an overruling providence, who shut up the sea with doors, who appointed for it a decreed place, and said, Thus far thou shalt come, and here shall thy proud waves be stayed. As no accident remarkably unfortunate had befallen us, during a navigation of more than thirteen hundred miles, upon a coast every where abounding with the most dangerous rocks and shoals, no name of distress had hitherto been given to any cape or point of land which we had seen. But we now gave the name of Cape Tribulation, to a point we had just seen farthest to the northward, because here we became acquainted with misfortune. The cape lies in latitude 16 deg. 6 min. S. and 214 deg. 39 min. W. longitude.

This day, Sunday the 10th, at six in the evening we shortened sail, and hauled off shore close upon a wind, to avoid the danger of some rocks, which were seen ahead, and to observe whether any islands lay in the offing, as we were near the latitude of those islands, said to have been discovered by Quiros. We kept standing off from six o'clock till near nine, with a fine breeze and bright moon. We had got into twenty-one fathom water, when suddenly we fell into twelve, ten, and eight fathom, in a few minutes. Every man was instantly ordered to his station, and we were on the point of anchoring, when, on a sudden, we had again deep water, so that we thought all danger at an end, concluding we had failed over the tail of some shoals, which we had seen in the evening. We had twenty fathoms and upwards before ten o'clock, and this depth continuing some time, the gentlemen, who had hitherto been upon duty, retired to rest; but in less than an hour the water shallowed at once from twenty to seventeen fathoms, and before soundings could be taken the ship struck upon a rock, and remained immovable. Every one was instantly on deck, with countenances fully expressive of the horrors of our situation. Knowing we were not near the shore, we concluded that we were upon a rock of coral, the points of which are sharp, and the surface so rough, as to grind away whatever it rubbed against, even with the gentlest motion. All the sails being immediately taken in, and our boats hoisted out, we found, that the ship had been lifted over a ledge of the rock, and lay in a hollow within it. Finding the water was deepest a-stern, we carried out the anchor from the starboard quarter, and applied our whole force to the capstan, in hopes to get the vessel off, but in vain. She now beat so violently against the rock, that the crew could scarcely keep on their legs. The moon shone bright, by the light of which we could see the sheathing-boards float from the bottom of the vessel, till at length the false keel followed, so that we expected instant destruction. Our best chance of escaping seemed now to be by lightening her; but having struck at high water, we should have been in our present situation after the vessel should draw as much less water as the water had sunk; our anxiety abated a little, on finding that the ship settled on the rocks as the tide ebbed, and we flattered ourselves, that, if the ship should keep together till next tide, we might have some chance of floating her. We therefore instantly started the water in the hold, and pumped it up. The decayed stores, oil-jars, casks, ballast, six guns, and other things, were

thrown overboard, in order to get at the heavier articles; and in this business we were employed till day-break, during all which time not an oath was sworn, so much were the minds of the sailors impressed with a sense of their danger.

On Monday the 11th, at day-light we saw land at eight leagues distance, but not a single island between us and the main, on which part of the crew might have been landed, while the boat went on shore with the rest: so that the destruction of the greater part of us would have been inevitable had the ship gone to pieces. It happened that the wind died away to a dead calm before noon. As we expected high-water about eleven o'clock, every thing was prepared to make another effort to free the ship, but the tide fell so much short of that in the night, that she did not float by 18 inches, though we had thrown over-board near fifty tons weight: we therefore renewed our toil, and threw over-board every thing that could possibly be spared; as the tide fell, the water poured in so rapidly, that we could scarce keep her free by the constant working of two pumps. Our only hope now depended on the mid-night tide, and preparations were accordingly made for another effort to get the ship off. The tide began to rise at five o'clock, when the leak likewise increased to such a degree, that two pumps more were manned, but only one of them would work; three, therefore, were kept going till nine o'clock, at which time the ship righted; but so much water had been admitted by the leak, that we expected she would sink as soon as the water should bear her off the rock. Our situation was now deplorable, beyond description, almost all hope being at an end. We knew that when the fatal moment should arrive, all authority would be at an end. The boats were incapable of conveying all on shore, and we dreaded a contest for the preference, as more shocking than the shipwreck itself: yet it was considered, that those who might be left on board, would eventually meet with a milder fate than those who, by gaining the shore, would have no chance but to linger out the remains of life among the rudest savages in the universe, and in a country, where fire-arms would barely enable them to support themselves in a most wretched situation. At twenty minutes after ten the ship floated, and was heaved into deep water, when we were happy to find that she did not admit more water than she had done before: yet as the leak had for a considerable time gained on the pumps, there was now three feet nine inches water in the hold. By this time the men were so worn by fatigue of mind and body, that none of them could pump more than five or six minutes at a time, and then threw themselves, quite spent, on the deck, amidst a stream of water which came from the pumps. The succeeding man being fatigued in his turn, threw himself down in the same manner, while the former jumped up and renewed his labour, thus mutually struggling for life, till the following accident had like to have given them up a prey to absolute despair, and thereby insured our destruction. Between the inside lining of the ship's bottom, which is called the ceiling, and the outside planking, there is a space of about seventeen or eighteen inches. The man who had hitherto taken the depth of water at the well, had taken it no farther than the ceiling, but being now relieved by another person, who took the depth of the outside plank, it appeared by this mistake, that the leak had suddenly gained upon the pumps, the whole difference between the two planks. This circumstance deprived us of all hopes, and scarce any one thought it worth while to labour, for the longer preservation of a life which must so soon have a period: but the mistake was soon discovered; and the joy arising from such unexpected good news inspired the men with so much vigour, that before eight o'clock in the morning, they had pumped out considerably more water than they had shipped. We now talked of nothing but getting the ship into some harbour, and set heartily to work to get in the anchors; one of which, and the cable of another, we lost; but these were now considered as trifles. Having a good breeze from sea, we got under sail at eleven o'clock,

*View of ENDEAVOUR RIVER, on the Coast of New Holland, where Captain Cook had the Ship laid
on shore, in order to repair the Damage which she received on the Rocks.*

o'clock, and steered for land. As we could not discover the exact situation of the leak, we had no prospect of stopping it within tide of the vessel, but on Tuesday the 12th, the following expedient, which one of the midshipmen had formerly seen tried with success, was adopted. We took an old studding sail, and having mixed a large quantity of oakham and wool, chopped small, it was stitched down in handfals on the sail, as lightly as possible. The dung of sheep and other filth being spread over it. Thus prepared, the sail was hauled under the ship, by ropes, which kept it extended till it came under the leak, when the suction carried in the oakham and wool from the surface of the sail. This experiment succeeded so well, that instead of three pumps, the water was easily kept under with one.

We had hitherto no farther view than to run the ship into some harbour, and build a vessel from her materials, in which we might reach the East-Indies; but we now began to think of finding a proper place to repair her damage, and then to pursue her voyage on its original plan. At six in the evening we anchored seven leagues from the shore; and found that the ship made 15 inches water an hour during the night; but as the pumps could clear this quantity, we were not uneasy. At nine in the morning we passed two islands, which were called Hope Islands, because the reaching of them had been the object of our wishes, at the time of the shipwreck. In the afternoon, the master was sent out with two boats to sound and search for a harbour where the ship might be repaired, and we anchored at sun-set,

in four fathoms water, two miles from the shore. One of the mates being sent out in the pinnace, returned at nine o'clock, reporting, that he had found such a harbour as was wanted, at the distance of two leagues.

Wednesday the 13th, at six o'clock we sailed, having previously sent two boats a-head, to point out the shoals that we saw in our way. We soon anchored about a mile from the shore, when the captain went out, and found the channel very narrow, but the harbour was better adapted to our present purpose, than any place we had seen in the whole course of the voyage. As it blew very fresh this day and the following night, we could not venture to run into the harbour, but remained at anchor during the two succeeding days, in the course of which we observed four Indians on the hills, who stopped and made two fires.

Our men, by this time, began to be afflicted with the scurvy; and our Indian friend Tupia was so ill with it, that he had livid spots on both his legs. Mr. Green the astronomer was likewise ill of the same disorder; so that our being detained from landing was every way disagreeable. The wind continued fresh till the 17th, and then we resolved to push in for the harbour, and twice ran the ship a-ground; the second time she stuck fast, on which we took down the booms, fore-yard, and fore-top masts, and made a raft on the side of the ship; and, as the tide happened to be rising, she floated at one o'clock. We soon got her into the harbour, where she was moored along the side of a beach, and the anchors, cables, &c. immediately taken out of her.

C H A P. IX.

The ship is refitted in Endeavour River—Transactions during that time—The country, its inhabitants and productions described—A description of the harbour, the adjacent country, and several islands near the coast—The range from Endeavour River to the northern extremity of the country—And the dangers of that navigation—The Endeavour departs from South Wales—That country, its produce and people described, with a specimen of the language.

ON Monday the 18th in the morning, we erected a tent for the sick, who were brought on shore as soon it was ready for their reception. We likewise built a stage from the ship to the shore, and set up a tent to hold the provisions and stores, that were landed the same day. The boat was now dispatched in search of fish for the refreshment of the sick, but she returned without getting any; but Tupia employed himself in angling, and living entirely upon what he caught, recovered his health very fast. In an excursion Mr. Banks made up the country, he saw the frames of several huts, and Capt. Cook having ascended one of the highest hills, observed the land to be stoney and barren, and the low land near the river over-run with mangroves, among which the salt-water flowed every tide.

Tuesday the 19th, the smith's forge was set up, and the armourer prepared the necessary iron-work for the repair of the vessel. The officers stores, ballast, water, &c. were likewise ordered out, in order to lighten the ship. This day Mr. Banks crossed the river to view the country, which he observed to be little else than sand hills. He saw vast flocks of pigeons, most beautiful birds, of which he shot several. On Wednesday the 20th, as we were removing the coals, the water rushed in, near the foremast, about three feet from the keel; so that it was resolved to clear the hold entirely; which being done on Friday the 22nd, we warped the ship higher up the harbour, to a station more proper for laying her a-shore, in order to stop the leak. Early in the morning, the tide having left her, we proceeded to examine the leak, when it appeared that the rocks had cut through four planks into the timbers, and that three other planks were damaged. In these breaches not a splinter was to be seen, the whole being smooth as if cut away by an instrument: but it was the will of an omnipotent being, that the vessel should be preserved by a very singular circumstance: for though one of the holes was large enough

to have sunk her, even with eight pumps constantly at work, yet this inlet to our destruction was partly stopped up, by a fragment of the rock being left sticking therein. We likewise found some pieces of the oakham, wool, &c. which had got between the timbers, and stopped those parts of the leak that the stone had left open. Exclusive of the leak great damage was done to various parts of the ship's bottom. While the smiths were employed in making nails and bolts, the carpenters began to work on the vessel; and some of the people were sent on the other side of the river to shoot pigeons for the sick. They found a stream of fresh water, several inhabitants of the Indians, and saw a mouse-coloured animal, exceeding swift, and about the size of a greyhound.

On Saturday the 23d, a boat was dispatched to haul the seine, and returned at noon with only three fish, and yet we saw them in plenty leaping about the harbour. This day many of the crew saw the animal above-mentioned; and one of the seamen declared he had seen the devil, which John thus described, "He was, says he, as large as a one gallon keg, and very like it: he had horns and wings, yet he crept so slowly through the grass, that if I had not been afraid, I might have touched him." This formidable apparition we afterwards discovered to have been a batt, which we must acknowledge has a frightful appearance, it being black, and full as large as a partridge; but the man's own apprehensions had furnished his devil with horns.

Sunday, Mr. Gore and a party of men sent out with him, procured a bunch or two of wild plantains, and a few palm cabbages, for the refreshment of the sick: and this day the Captain and Mr. Banks saw the animal already mentioned. It had a long-tail that it carried like a greyhound, leaped like a deer, and the point of its foot resembled that of a goat. The repairs of the ship on the starboard side having been finished the preceding day, the carpenters now began to work under her larboard bow; and being examined abast it appear-

ed she had received very little injury in that quarter. Mr. Banks having removed his whole collection of plants into the bread room, they were this day under water, by which some of them were totally destroyed; however by great care most of them were restored to a state of preservation. A plant was found this day, the 25th, the leaves of which were almost as good as spinach; also a fruit of a deep purple colour, and the size of a golden pippin, which after having been kept a few days tasted like a damson. On Tuesday, the 26th, the carpenter was engaged in caulking the ship, and the men in other necessary business; and on the 27th the armourer continued to work at the forge, and the carpenter on the ship; while the Captain made several hauls with the large net, but caught only between twenty and thirty fish, which were distributed among the sick, and those who were not yet quite recovered. We began this day to move some of the weight from the after-part of the ship forward, to ease her. On the 28th, Mr. Banks with some seamen went up into the country, to whom he shewed a plant which served them for greens, and which the inhabitants of the West-Indies call Indian Kale. Here we saw a tree notched for climbing; also nests of white ants from a few inches to five feet in height; prints of mens feet, and the tracks of three or four animals were likewise discovered.

On Friday the 29th, at two o'clock in the morning, Capt. Cook with Mr. Green, observed an emersion of Jupiter's first satellite: the time here was 2 hours 18 min. 53 sec. which makes the longitude of this place 214 deg. 42 min. 30 sec. W. and the latitude 15 deg. 26 min. S. At dawn of day the boat was sent out to haul for fish, and took what made an allowance of one pound and a half to each man. One of our midshipmen, this day abroad with his gun, reported, that he had seen a wolf, resembling exactly the same species in America, at which he shot, but could not kill it. The next morning, being the 30th, the captain ascended a hill to take a view of the sea, when he observed innumerable sand banks and shoals, in every direction; but to the northward there was an appearance of a passage, which seemed the only way to steer clear of the surrounding dangers, especially as the wind blows constantly from the S. E. Mr. Gore saw this day two straw coloured animals of the size of a hare, but shaped like a dog. In the afternoon the people returned with such a quantity of fish, that two pounds and a half were distributed to each man; and plenty of greens had been gathered, which when boiled with peas made an excellent mess, and we all thought this day's fare an unspeakable refreshment.

On Sunday the 1st of July all the crew had permission to go on shore, except one from each mess, part of whom were again sent out with the seine, and were again equally successful. Some of our people who went up in the country, gave an account of their having seen several animals, and a fire about a mile up the river. On Tuesday the 3d, the master, who had been sent in the pinnace, returned, and reported, that he had found a passage out to sea, between shoals which consisted of coral rocks, many whereof were dry at low water. He found some cockles so large, that one of them was more than sufficient for two men; likewise plenty of other shell-fish, of which he brought a supply to the ship, in his return to which he had landed in a bay where some Indians were at supper; but they instantly retired, leaving some sea eggs by a fire for dressing them. This day we made another attempt to float the ship, and happily succeeded at high water; when we found, that by the position she had lain in, one of her planks was sprung, so that it was again necessary to lay her ashore. An alligator swam by her several times at high water.

Wednesday the 4th was employed in trimming her upon an even keel, warping her over, and laying her down on a sand-bank, on the south side of the river; and on the next day, the 5th, she was again floated, and moored off the beach, in order to receive the stores on board. This day we crossed the harbour, and found on a sandy beach a great number of fruits, not

discovered before; among others a cocoa-nut, which Tupia said had been opened by a crab, and was judged to be what the Dutch call *Beurs Krabbe*. The vegetable substances which Mr. Banks picked, up were encrusted with marine productions, and covered with barnacles, a proof of their having been transplanted, probably from Terra del Esperito Santo. This gentleman with a party having sailed up the river on the 6th, to make an excursion up the country, returned on the 8th. Having followed the course of the river, they found it at length contracted into a narrow channel, bounded by steep banks, adorned with trees of a most beautiful appearance, among which was the bark tree. The land was low and covered with grass, and seemed capable of being cultivated to great advantage. The night, though we had made a fire on the banks of the river, was rendered extremely disagreeable by the stings of the musquitos, that cause an almost intolerable torment. Going in pursuit of game, we saw four animals, two of which were chased by Mr. Banks's greyhound, but they greatly outstripped him in speed, by leaping over the long thick grass, which incommoded the dog in running. It was observed of the animals, that they bounded forward on two legs instead of running on four. Having returned to the boat we proceeded up the river, till it contracted to a brook of fresh water, but in which the tide rose considerably. Having stopped to pass the night, with hope of some rest, we saw a smoke at a distance, on which three of us approached it, but the Indians were gone. We saw the impressions of feet on the sand, below high-water mark, and found a fire still burning in the hollow of an old tree. At a small distance were several huts, and we observed ovens dug in the ground: the remains of a recent meal were likewise apparent. We now retired to our resting-place, and slept on plantain leaves, with a bunch of grass for our pillows, on the side of a sand-bank, under the shelter of a bush. The tide favouring our return in the morning, we lost no time in getting back to the ship. The master, who had been seven leagues at sea, returned soon after Mr. Banks, bringing with him three turtles, which he took with a boat-hook, and which together weighed near eight hundred pounds. He was sent out next morning, and Mr. Banks accompanied him with proper instruments for catching turtle; but not being successful, he would not go back that night, so that Mr. Banks, after collecting some shells and marine productions, returned in his own small boat. In the morning the second lieutenant was sent to bring the master back, soon after which four Indians, in a small canoe, were within sight. The captain now determined to take no notice of these people as the most likely way to be noticed by them. This project answered; two of them came within musquet shot of the vessel, where they conversed very loud; in return, the people on board shouted, and made signs of invitation. The Indians gradually approached, with their lances held up; not in a menacing manner, but as if they meant, to intimate that they were capable of defending themselves. They came almost along-side, when the captain threw them cloth, nails, paper, &c. which did not seem to attract their notice, at length one of the sailors threw a small fish, which so pleased them, that they hinted their designs of bringing their companions, and immediately rowed for the shore. In the interim, Tupia and some of the crew landed on the opposite shore. The four Indians now came quite along-side the ship, and having received farther presents, landed where Tupia and the sailors had gone. They had each two lances, and a stick with which they threw them. Advancing towards the English, Tupia persuaded them to lay down their arms, and sit by him, which they readily did. Others of the crew now going on shore, the Indians seemed jealous, lest they should get between them and their arms, but care was taken to convince them that no such thing was intended; and more trifles were presented to them. The crew staid with them till dinner-time, and then made signs of invitation for them to go to the ship and eat; but this they declined, and retired in their canoe. These men

were of the common stature, with very small limbs; their complexion was of a deep chocolate; their hair black, either lank or curled, but not of the woolly kind; the breasts and upper lip of one of them were painted with streaks of white, which he called carbanda, and some part of their bodies had been painted red. Their teeth were white and even, their eyes bright, and their features rather pleasing; their voices musical, and they repeated several English words with great readiness.

The next morning, the visit of three of these Indians was renewed, and they brought with them a fourth, whom they called Yaparico, who appeared to be a person of some consequence. The bone of a bird, about six inches long, was thrust through the gristle of his nose; and indeed all the inhabitants of this place had their noses bored, for the reception of such an ornament. These people being all naked, the captain gave one of them an old shirt, which he bound round his head like a turban, instead of using it to cover any part of his body. They brought a fish to the ship, which was supposed to be in payment for that given them the day before: after staying some time with apparent satisfaction, they suddenly leaped into their canoe, and rowed off, from a jealousy of some of the gentlemen who were examining it.

On the 12th of July, three Indians visited Tupia's tent, and after remaining some time, went for two others, whom they introduced by name. Some fish was offered them, but they seemed not much to regard it; after eating a little, they gave the remainder to Mr. Banks's dog. Some ribbands which had been given them, to which medals were suspended round their necks, were so changed by smoke, that it was difficult to judge what colour they had been, and the smoke had made their skins look darker than their natural colour, from whence it was thought that they had slept close to their fires, as a preventative against the sting of the musquitos. Both the strangers had bones through their noses, and a piece of bark tied over their foreheads; and one of them had an ornament of strings round his arm; and an elegant necklace made of shells. Their canoe was about ten feet long, and calculated to hold four persons, and when it was in shallow water they moved it by the help of poles. Their lances had only a single point, and some of them were barbed with fish-bones. On the 14th Mr. Gore shot one of the mouse-coloured animals above-mentioned. It chanced to be a young one, weighing more than 38 pounds; but when they are full grown, they are as large as a sheep. The skin of this beast which is called Kangaroo, is covered with short fur, and is of a dark mouse colour; the head and ears are somewhat like those of a hare; this animal was dressed for dinner, and proved fine eating. The ship's crew fed on turtle almost every day, which were finer than those eaten in England, owing to their being killed before their natural fat was wasted, and their juices changed.

On the 17th, Mr. Banks and Dr. Solander went with the captain into the woods, and saw four Indians in a canoe, who went on shore, and walked up without sign of fear. They accepted some beads, and departed, intimating that they did not chuse to be followed. The natives being now become familiar with the ship's crew, one of them was desired to throw his lance, which he did with such dexterity and force, that though it was not above four feet from the ground at the highest, it penetrated deeply into a tree at the distance of fifty yards. The natives now came on board the ship, and were well pleased with their entertainment.

On the 19th, we saw several of the women, who, as well as the men, were quite naked. We were this day visited by ten Indians, who seemed resolved to have one of the turtles that was on board, which they repeatedly made signs for, and being as repeatedly refused, they expressed the utmost rage and resentment, one of them in particular, having received a denial from Mr. Banks, he flunged, and pushed him away in a most violent manner. At length they laid hands on two of the turtles, and drew them to the side of the ship where the canoe lay, but the sailors took them

away. They made several similar attempts, but being equally unsuccessful, they leaped suddenly into their canoe, and rowed off. At this instant the captain, with Mr. Banks, and five or six of the seamen, went on shore, where they arrived before the Indians, and where many of the crew were already employed. As soon as the Indians landed, one of them snatched a fire brand from under a pitch-kettle, and running to the windward of what effects were left on shore, set fire to the dry grass, which burned rapidly, scorched a pig to death, burned part of the smith's forge, and would have destroyed a tent of Mr. Banks, but that some people came from the ship just in time to get it out of the way of the flames. In the mean while the Indians went to a place where the fishing-nets lay, and a quantity of linen was laid out to dry, and there again set fire to the grass, in spite of all persuasion, and even of threats. A musquet loaded with small shot was fired, and one of them being wounded, they ran away, and this second fire was extinguished; but the other burned far into the woods.

The Indians still continuing in sight, a musquet charged with ball was fired, the report only of which sent them out of sight; but their voices being heard in the woods, the Captain with a few people went to meet them. Both parties stopped when in sight of each other; at which time an old Indian advanced before the rest a little way, but soon halted, and after having spoke some words, which we could not understand, he retreated to his companions, and they all retired slowly in a body. Having found means to seize some of their darts, we continued following them about a mile, and then sat down upon some rocks, the Indians sitting down also about an hundred yards from us. The old man again came forward, having a lance without a point in his hand; he stopped several times at different distances, and spoke, whereupon the captain made signs of friendship, which they answered. The old man now turned, and spoke aloud to his companions, who placed their lances against a tree, and came forward in a friendly manner. When they came up to us, we returned the darts we had taken, and we perceived with great satisfaction, that this rendered the reconciliation complete. In this party were four persons whom we had not seen before, who, as usual, were introduced to us by name, but the man who had been wounded in the attempt to burn our nets, was not among them. Having received from us some trinkets, they walked amicably toward the coast, intimating by signs, that they would not fire the grass again. When we came opposite the ship they sat down, but we could not prevail with them to go on board. They accepted a few musquet balls, the use and effect of which the Captain endeavoured to explain. We then left them, and when arrived at the ship, we saw the woods burning at the distance of two miles. We had no conception of the fury with which grass would burn in this hot climate, nor of the difficulty of extinguishing it; but we determined, that if it should ever again be necessary for us to pitch our tents in such a situation, our first work should be to clear the ground round us.

Friday the 20th, our ship being ready for sea, the master was sent in search of a passage to the northward, but could not find any; while the Captain founded and buoyed the bar. This day we saw not any Indians; but the hills for many miles were on fire, which at night made an appearance truly sublime. On the 22nd, we killed a turtle, through both shoulders of which stuck a wooden harpoon, near fifteen inches long, bearded at the end, and about the thickness of a man's finger, resembling such as we had seen among the natives. The turtle appeared to have been struck a considerable time, for the wound was perfectly healed. On the 24th, one of the sailors, who with others had been sent to gather kale, having strayed from the rest, fell in with four Indians at dinner. He was at first much alarmed, but had prudence enough to conceal his apprehensions; and sitting down by them gave them his knife, which having examined, they returned. He would then have left them; but they seemed disposed

to detain him, till, by feeling his hands and face, they were convinced he was made of flesh and blood like themselves. They treated him with great civility, and having kept him about half an hour, they made signs that he might depart. When he left them, not taking the direct way to the ship, they came from the fire and shewed him the nearest way; from whence we concluded, that they well knew from whence he came. We may here observe, that the language of these people seemed to us more harsh than that of the islanders in the South-Sea. They were continually repeating the word *chercau*, a term as we imagined of admiration. They also cried out, when they saw any thing new, *cher, tut, tut, tut, tut!* which probably was a similar expression. Mr. Banks having gone on shore in search of plants, found the cloth which had been distributed among the natives, lying in a heap, as useless lumber. Indeed they seemed to set very little value upon any thing we had except our turtle, a commodity we were least inclined and able to spare.

Tuesday the 24th, Mr. Banks and Dr. Solander returning from the woods, through a deep valley, found lying on the ground several marking nuts, the *Anacardium orientale*; but they sought in vain for the tree that bore them. On the 26th, as Mr. Banks was again searching the country to enrich his natural history, he took an animal of the *Opossum* kind, with two young ones. On the 27th, Mr. Gore shot a Kangaroo, which weighed eighty-four pounds, though not at its full growth. When dressed on the 28th, we found it had a much worse flavour than that we had eaten before.

Sunday the 29th, we got the anchor up, and made all ready to put to sea. A boat was sent out to ascertain what water was upon the bar; when returned, the officer reported, that there was only thirteen feet, which was six inches less than the ship drew. We therefore this day gave up all hopes of sailing. Monday the 30th, we had fresh gales with hazy weather and rain, till Tuesday the 31st, at two in the morning, when the weather became more moderate. During all this time the pinnace and yawl continued to ply the net and hook with tolerable good success, bringing in at different times a turtle, and from two to three hundred weight of fish.

On Wednesday the 1st of August, the pumps were examined by the carpenter, who found them all in a state of decay, and some quite rotten, owing, as he said, to the sap having been left in the wood: but as the ship admitted only an inch of water in an hour, we hoped she was stout enough, and trusted to her soundness.

On Saturday the 4th, at seven o'clock in the morning, we once more got under sail, and put to sea. We stood off E. by N. with the pinnace a-head to keep sounding. About noon we came to an anchor, when the harbour from whence we had sailed bore S. 70 W. distant about five leagues. The captain here named the northernmost point of land in sight Cape Bedford, and the harbour we had quitted Endeavour River. Our latitude by observation was now 15 deg. 32 min. S. Endeavour River is only a small bar harbour, or creek, which runs in a winding channel three or four leagues inland. The depth of water for shipping is not more than a mile within the bar, and only on the north-side. At the new and full of the moon, it is high water between nine and ten o'clock. It must also be remembered, that this part of the coast is so barricaded with shoals, as to make the harbour very difficult of access: the safest approach is from the southward, keeping the main land close upon the board all the way. Over the south point is some high land, but the north point is formed by a low sandy beach. The provisions we procured in this harbour consisted of turtle, oysters of different sorts, cavalhe or scomber, flat fish, skate or ray fish, purflain, wild beans, and cabbage-palms. Of quadrupedes, there are goats, wolves, pole-cats, a spotted animal of the *viverra* kind, and several kinds of serpents, some of which only are venomous. Dogs are the only tame animals. The land fowls are kites, crows, hawks, loriquets, cockatoos, parrots, pigeons, and small birds of various sorts, the

names of which we could not learn. The water fowls are wild geese, curlews, hens, whistling ducks that perch on trees, and some few others. The soil of the hills, though stoney, produces coarse grass besides wood, that of the valleys is in general well clothed, and has the appearance of fertility. The trees here are of various sorts, of which the gum trees are the most common. On each side of the river are mangroves, which in some parts extend a mile within the coast. The country is well watered, and ant-hills are every where in great numbers.

On Saturday the 4th, Capt. Cook went up to the mast-head to look at some dangerous shoals, several of which he saw above the water. This day such a quantity of fish was caught, as allowed a dividend of two pounds to each man. During the six following days we attempted to sail between the shoals and breakers, by which we were every way surrounded. On the 10th we were between a head land and three islands, which had been discovered the preceding day. We now entertained hopes of being out of danger; but this not proving to be the case, we called the head-land Cape Flattery. Some land was now discovered, and was generally taken for the main; but in the captain's opinion a cluster of islands. Upon this diversity of sentiments it was resolved to bring the ship to an anchor. This done, the captain landed, and from a high point took a survey of the sea-coast, by which he was confirmed in his conjecture. On the point where he stood were seen the prints of human feet, in white sand of an exquisite fineness; and the place was named Point Lookout. To the northward of this the coast appeared to be shoal and flat, for a considerable distance, which did not encourage our hope, that the channel we had hitherto found in with the land would continue.

On Saturday the 11th, early in the morning, Mr. Banks and Capt. Cook went to visit the largest of the three islands, and having gained the summit of the highest hill, they beheld a reef of rocks, whereon the sea broke in a frightful manner; but the hazy weather preventing a perfect view, they lodged under a bush during the night, and next day seeing what had the appearance of a channel between the reefs, one of the mates on the 12th, was sent out in the pinnace to examine it; and at noon returned, having found between fifteen and twenty-eight fathom of water; but it blew so hard, that the mate did not dare to venture into one of the channels, which he said appeared to be very narrow; but the captain judged he had seen them to a disadvantage. While busy in his survey, Mr. Banks was attentive to his favourite pursuit, and collected many plants he had not before seen. This island, visible at twelve leagues distance, and in general barren, we found to be about eight leagues in circumference. There are some sandy bays and low-land on the N. W. side, which is covered with long grass, and trees of the same kind with those on the main; lizards of a very large size also abounded, some of which we took. We found also fresh water in two places; one running stream, close to the sea, was a little brackish; the other was a standing pool perfectly sweet. We were surprized to see, that, notwithstanding the distance of this island from the main, it was sometimes visited by the Indians from thence; as was plain from seven or eight frames of their huts which we found. All these were built on eminencies, and from their situation, we judged, that the weather here, at certain seasons, is invariably calm and mild. On our return to the ship, the captain named this place the Lizard Island, on account of our having seen no other animals but lizards. When returning, we landed on a low sandy island, upon which were birds of various kinds. We took a nest of young eagles, and therefore called the place Eagle Island. We found also a nest of some other bird, of a most enormous size: it was made with sticks upon the ground, and was not less than six and twenty feet in circumference, and two feet eight inches high. We perceived that this place also had been visited by the Indians. During our absence from the ship, the master had landed on several low islands, where he had seen great heaps of turtle shells,

shells, and found the fins of them, which the Indians had left hanging on the trees, so fresh, that they were dressed and eaten by the boat's crew.

On Sunday the 12th, the officers held a consultation, and we were unanimous in opinion, that it would be best to quit the coast altogether, till we could approach it with less danger; in consequence of which concurrent opinion, we sailed on Monday the 13th, and got through one of the channels in the reef, happy at finding ourselves once more in the open sea, after having been surrounded by dreadful shoals and rocks for near three months. We had now sailed above 1000 miles, during which run we had been obliged to keep founding, without the intermission of a single minute; a circumstance which, it is supposed, never happened to any ship but the *Endeavour*. The passage through which we passed into the open sea beyond the reef, is in latitude 14 deg. 32 min. S. and may always be known by the three high islands within it, which Capt. Cook called the Islands of Direction, because by these a stranger may find a safe channel through the reef quite to the main. The channel lies from Lizard Island N. E. half N. distant three leagues, and is about one third of a mile broad, and much the same in length. The islands abound in turtle and other fish, and on the beach we found bamboos, cocoa-nuts, pumice-stone, and the seeds of plants, supposed to be wafted thither by the trade winds, as the plants themselves are not natives of the country.

On Tuesday the 14th, we anchored, and by observation, our latitude was 13 deg. 46 min. S. and at this time we had no land in sight. On the 15th we steered a westerly course, in order to get sight of land, that we might not overshoot the passage, if a passage there was between this land and New Guinea. Early in the afternoon we had sight of land, which had the appearance of hilly islands, but it was judged to be part of the main, and we saw breakers between the vessel and the land, in which there was an opening; to get clear, we set all our sails, and stood to the northward till midnight, and then went on a southward tack for about two miles, when the breeze died away to a dead calm. When day-light came on we saw a dreadful surf break at a vast height, within a mile of the ship, towards which the rolling waves carried her with great rapidity. Thus distressed, the boats were sent a-head to tow, and the head of the vessel was brought about, but not till she was within a hundred yards of the rock, between which and her there was nothing left but the chasm, and which had risen and broke to a wonderful height on the rock; but in the moment we expected instant destruction, a breeze, hardly discernable, aided the boats in getting the vessel in an oblique direction from the rock. The hopes, however, afforded by this providential circumstance, were destroyed by a perfect calm, which succeeded in a few minutes; yet the breeze once more returned, before we had lost the little ground which had been gained. At this time a small opening was seen in the reef, and a young officer being sent to examine it, found that its breadth did not much exceed the length of the ship, but that there was smooth water on the other side of the rocks. Animated by the desire of preserving life, we now attempted to pass the opening; but this was impossible; for it having become high-water in the interim, the ebb tide rushed through it with amazing impetuosity, carrying the ship about a quarter of a mile from the reef, and she soon reached the distance of near two miles, by the help of the boats. When the ebb tide was spent, the tide of flood again drove the vessel very near the rocks, so that our prospect of destruction was renewed, when we discovered another opening, and a light breeze springing up, we entered it, and were driven through it, with a rapidity that prevented the ship from striking against either side of the channel. The ship now came to an anchor, and our crew were grateful for having regained a station, which they had been very lately most anxious to quit. The name of Providence Channel was given to the opening through which the ship had thus escaped the most imminent dangers. A high promontory on the main land

No. 8.

in sight, was denominated Cape Weymouth, and a bay near it Weymouth Bay. This day the boats went out to fish, and met with great success, particularly in catching cockles, some of which were of such an amazing size, as to require the strength of two men to move them. Mr. Banks likewise succeeded in his search for rare shells, and different kinds of coral.

On the 18th, we discovered several small islands, which were called Forbes's Islands, and had a sight of a high point of land on the main, which was named the Bolt Head. On the 19th, we discovered several other small islands, the land of which was low, barren, and sandy. A point was seen, and called Cape Grenville, and a bay which took the name of Temple Bay. In the afternoon many other islands were seen, which were denominated Bird Isles, from their being frequented by numerous flocks of birds. On the 20th many more small islands were seen, on one of which were a few trees, and several Indian huts, supposed to have been erected by the natives of the main land, as temporary habitations during their visit to these islands. On the 21st we sailed through a channel, in which was a number of shoals; and gave the name of York Cape to a point of the main land which forms the side of the channel. A large bay is formed to the south of the cape, which was called Newcastle Bay, and in which are several little islands; on the north-side of the cape the land is rather mountainous, but the low parts of the country abound with trees; the islands discovered in the morning of this day, were called York Isles. In the afternoon we anchored between some islands, and observed, that the channel now began to grow wider; we perceived two distant points, between which no land could be seen, so that the hope of having at length explored a passage into the Indian Sea, began to animate every breast; but, to bring the matter to a certainty, the captain took a party, and being accompanied by Messrs. Solander and Banks, they landed on an island, on which they had seen a number of Indians, ten of whom were on a hill, one of them carrying a bow and a bundle of arrows, the rest armed with lances; and round the necks of two of them hung strings of mother of pearl. Three of these Indians stood on shore, as if to oppose the landing of the boat, but they retired before it reached the beach. The captain and his company now ascended a hill, from whence they had a view of near forty miles, in which space there was nothing that threatened to oppose their passage, so that the certainty of a channel seemed to be almost indubitable. Previous to their leaving the island, Capt. Cook displayed the English colours, and took possession of all the eastern coast of the country, from the 38th deg. of S. latitude to the present spot, by the name of New South Wales, for his sovereign the King of Great Britain: and three volleys of small arms being fired, and answered by an equal number from the *Endeavour*, the place received the name of Possession Island. The next morning we saw three naked women collecting shell-fish on the beach; and weighing anchor, gave the name of Cape Cornwall to the extreme point of the largest island on the north-west side of the passage: some low islands near the middle of the channel receiving the name of Wallis's Isle; soon after which the ship came to an anchor, and the long-boat was sent out to found. Towards evening we sailed again, and the captain landed with Mr. Banks, on a small island which was frequented by immense numbers of birds, the majority of which being boobies, the place received the name of Booby Island. We were now advanced to the northern extremity of New Holland, and had the satisfaction of viewing the open sea to the westward. The N. E. entrance of the passage is formed by the main land of New Holland, and by a number of islands, which took the name of the Prince of Wales's Islands, and which Capt. Cook imagines may reach to New Guinea; these islands abound with trees and grass, and were known to be inhabited, from the smoke that was seen ascending in many places.

To the passage we had sailed through, Capt. Cook gave the name of Endeavour Straights. New South Wales is a much larger country than any hitherto known,

S

known, and not deemed a continent, being larger than all Europe, which is proved by the Endeavour's having coasted more than 2000 miles, even if her tract were reduced to a strait line. Northward of the latitude of 33 deg. the country is hilly, yet not mountainous; but to the southward of that latitude, it is mostly low and even ground. The hills in general are diversified by lawns and woods, and many of the valleys abound with herbage, though, on the whole, it cannot be deemed a fertile country. To the northward the grass is not so rich, nor the trees so high as in the southern parts, and almost every where, even the largest trees grow at a distance of not less than thirteen yards asunder. In all these places where the land forms a bay, the shore is covered with mangroves, that grow about a mile in land, in a swampy ground, which the spring tides always overflow; in some parts there are bogs, covered with thick grass, and plenty of under-wood in the valleys; the soil in general seems unfit for cultivation, though there are many spots where the arts of tillage might be attended with success. There are several salt creeks, running in many directions through the country, where there are also brooks of fresh water, but there are no rivers of any considerable extent; yet it seemed to be well watered, as the time when the ship was on the coast, was reckoned the driest season of the year. The gum-tree which yields a resin like the dragons blood. Here are three kinds of palm-trees, two of which are found only in the northern district. Nuts somewhat resembling chestnuts are produced by one of these, which were supposed to be eatable, yet some of the seamen having made free with them were taken very ill; two of whom died within a week, and it was not without difficulty that the third was recovered. The second sort of palm is much like the West Indian cabbage-tree, which yields a cabbage of an agreeable taste. The third sort abounds in the southern part, and produces a small cabbage of a very agreeable flavour, with many nuts, which furnish food for hogs. There is likewise a tree on which grows a purple apple that tastes like a damoscene, as we have before observed. Besides these there is a fig-tree, producing figs, but not of the finest sort, and they have another which bears a sort of plumb that is flat on the sides like a cheese. A plant was found here, the leaves of which were like those of the bulrush; it yields a bright yellow resin, that resembles gumbouge, but does not stain—it had a very agreeable smell. We found two sorts of yams, the one round and covered with stringy fibres, the other in shape like a radish; both of which are of a pleasant taste. A fruit of a disagreeable flavour was found, in shape resembling a pine-apple; and another that was much like a cherry, but had a soft kernel. The country produces purslain and wild parslay. We saw here, besides the beast already mentioned, one that was called a quall, the belly of this animal was quite white, its back was brown with white spots; and it was like a pole-cat. Vast numbers of beautiful pigeons were observed, and the seamen shot many of them, also eagles, hawks, cranes, herons, bustards, crows, parrots, parroquets, cockatoos, and some other birds of fine plumage, besides quails and doves.

In this country there are but few insects, and the ants and musquitos are the chief among them. There are four kinds of the former which deserve particular notice. The first of these are entirely green, and live on trees, where they build their nests in a very curious manner, bending down the leaves, and gluing them together with an animal juice, supposed to proceed from their own bodies. While several of these animals were busied in this employ, thousands were joined to keep the leaf in its proper situation, which, when they were disturbed in their work, flew back with a force that any one would have imagined to be superior to their united strength; at the same time they avenged themselves by severely stinging their disturbers. The second species of ants here are black, and live in the inside of the branches, after they have worked out the pith. The third sort lodged themselves in the root of a plant that twines round the trunks of other trees. This they made hollow, and cut into a great number of passages that ran

across each other, yet there was no appearance of the plants having been injured. They are not above half the size of the red ants of this country. As to the fourth sort they are like the East-Indian white ants, and had one sort of nests as big as a half-peck loaf which hung from the boughs of trees, and were composed of several minute parts of vegetables, which appeared to be stuck together by the glutinous juice before-mentioned. There was a communication between the cells, and passages to other nests upon the same tree; they had also a hollow covered passage to another nest on the ground, at the root of a different tree. The height of the ground-nests was found to be about six feet, and the breadth nearly the same: and the outside was plastered with clay almost two inches thick. These had a subterraneous passage leading to the roots of the trees near which they were constructed, from whence these creatures ascended the trunk and branches by covered ways, calculated for the purpose. It was concluded, that the ants resorted to these ground-nests during the wet season, as they were water proof.

Variety of fish is supplied by the seas in these parts, among which are mullets, cray-fish and crabs. Upon the shoals are found the rock, pearl, and other oysters, as well as the most delicate green turtle, besides those enormous cockles which have been already mentioned. Alligators are found in the rivers and salt creeks. The country does not appear to be inhabited by numbers any way proportioned to its great extent; not above thirty being ever seen together but once, which was when those of both sexes and all ages got together on a rock off Botany Bay, to view the ship. None of their villages consisted of more huts than would afford shelter for fourteen or fifteen men, and these were the largest numbers that were assembled with a view to attack us. No part of the country appeared to be cultivated, whence there must necessarily be fewer inhabitants on the inland parts than on the sea-coast. The men are well made, of the middle size, and active, in a high degree; but their voices are soft, even to effeminacy. Their colour is chocolate; but they were so covered with dirt, as to look almost as black as negroes. Their hair is naturally long and black, but they commonly cropped it short; in some few instances it is slightly curled, but in common quite straight; it is always matted with dirt, yet wholly free from lice; their beards are thick and bushy, but kept short by singeing. The women were seen only at a distance, as the men constantly left them behind when they crossed the river. The chief ornament of these people is the bone that is thrust through the nose, which the sailors whimsically called their spirit-sail yard; but besides this they wore necklaces formed of shells, a small cord tied twice or thrice round the arm between the elbow and shoulder, and a string of plaited human hair round the waist. Some few of them had an ornament of shells hanging across the breast. Besides these ornaments they painted their bodies and limbs white and red, in stripes of different dimensions; and they had a circle of white round each eye, and spots of it on the face. Their ears were bored, but they did not wear ear-rings. They accepted whatever was given them, but seemed to have no idea of making an adequate return; and they would not part with their ornaments for any thing that was offered in exchange. Their bodies were marked with scars, which they signified were in remembrance of the deceased. Their huts were built with small rods, the two ends of which were fixed into the ground, so as to form the figure of an oven; they are covered with pieces of bark and palm-leaves. The door of this building, which is only high enough to sit upright in, is opposite to the fire-places. They sleep with their heels turned up towards their heads; and even in this posture the hut will not hold more than four people. In the northern parts, where the weather was warmer, one side of the houses was left open, and the other opposed to whatever wind might blow at the time there; huts were only built for temporary use, and left behind when they removed to other parts of the country; but if their stay was only for a night or two, they had no other

other protection from the weather than what the grass and bushes afforded. While the huts on the main land were turned from the wind, those on the islands were towards it: a kind of proof that they visit the islands in fine weather, and enjoy the refreshing breeze while they slept. These huts are furnished with a kind of bucket for fetching water, made of an oblong piece of bark tied up at each end with the twig of a tree; and this is the only furniture of the house. On their backs they have a kind of bag, of the size and form of a cabbage-net, in which they carry their fish-hooks and lines, of the shells of which they make these hooks; the ornaments which they wear consist of some points of darts, and two or three bits of paint; and in this narrow compass lie all their riches. They feed on the kangaroo, and several kinds of birds when they can catch them; they likewise eat yams, and various kinds of fruit; but the principal article of their existence is fish. They were frequently observed with the leaves of a tree in their mouths, but whether it had the qualities of either tobacco or beetle could not be known; but it was observed not to discolour the teeth or lips.

From the notches that were seen in a great number of trees, for the purpose of climbing them, it was imagined that their method of taking the kangaroo, was by striking it with their lances as it passed under the tree. In these likewise, it is probable, that they took birds, while they were roosting, as they seemed too shy to be otherwise caught. Their method of producing fire, and extending the flames of it, is very singular: having wrought one end of a stick into an obtuse point, they place this point upon a piece of dry wood, and turning the upright stick very fast backward and forward between their hands, fire is soon produced, nor is it increased with less celerity. One of the natives was frequently observed to run along the sea coast, leaving fire in various places. The method taken to do this was as follows: before he set off, he wrapped up a little spark of fire in dry grass, and the quickness of his motion soon fanning it into a flame, he then placed it on the ground, and putting a spark of it in another bit of grass ran on again, and increased the number of his fires at pleasure. These fires were supposed to be intended for the taking of the kangaroo, as that animal was so very shy of fire, that when pursued by the dogs, it would not cross places which had been newly burnt, even when the fire was extinguished.

The natives of New South Wales make use of spears or lances, but these are very differently constructed: those that were seen in the southern parts of the country had four prongs, pointed with bone, and barbed, and the points were rubbed with a kind of wax, the smoothness of which made an easier passage into what was struck by them. On the contrary, the lances in the northern parts have only one point; the shafts of them are of different lengths, from eight to fourteen feet, are made of the stalk of a plant not unlike a bulrush, and consists of several joints let into each other, and tied together. The points of these lances are sometimes made of fish-bone, and sometimes of a hard heavy wood; they are barbed with other pieces of wood or stone, so that when they have entered any depth in the body, they cannot be drawn out without tearing the flesh in a shocking manner, or leaving splinters behind them. When the natives intend to wound at a considerable distance, they discharge this instrument with a throwing stick, but if the object be near them, it is thrown from the hand only. The throwing-stick is a piece of smooth, hard, red wood, half an inch thick, two inches broad, and about three feet in length, having a cross piece near four inches long at one end, and a small knob at the other. A small hollow is made in the shaft of the lance, near the point, and in this hollow the knob is received, but, on being forced forward, it will easily slip from it. The lance being placed on this throwing-stick, the Indian holds it over his shoulder, shakes it, and then throws both lance and stick with his utmost power; but as the cross-piece strikes the shoulder the sudden jerk stops the stick,

while the lance is driven forward with amazing rapidity, and is generally so well aimed, that a mark at the distance of fifty yards is more certainly struck with it than by a bullet from a gun. These people make use of shields made of the bark of trees, of about eighteen inches broad, and three feet long. Many trees were seen from whence the bark had been taken, and others on which the shields were cut out but not taken away. In the northern parts of this country, the canoes are formed by hollowing the trunk of a tree, and it was conjectured, that this operation must have been performed by fire, as the natives did not appear to have any instruments proper for the purpose. The canoes are in length about fourteen feet, and so narrow, that they would be frequently overset, but that they are provided with an out-rigger. The natives row them with paddles, using both hands in that employment. The canoes in the southern parts are formed only of a piece of bark four yards long, fastened together at each end, and the middle kept open by pieces of wood, passing from side to side. In deep water these are rowed by paddles, of about a foot and a half in length, the rower having one in each hand, but in shallow water they are pushed forward by means of a long stick. As these vessels are extremely light, and draw very little water, the Indians run them on the mud banks in search of shell-fish, some of which, it is probable, they broil and eat as soon as they are taken, as it was remarked that in the centre of these vessels there was usually a fire burning on a quantity of sea-weed. The natives have no tools but a wooden mallet, a kind of wedge, and an adze, made of stone, with some pieces of coral and shells, which may possibly be applied to the purposes of cutting. They polish the points of their lances, and their throwing-sticks, with the leaves of a tree that appears to be the wild fig, which bites with a sharpness, almost equal to that of a rasp. Four people are the greatest number that a canoe will contain: and when more than this number were to pass a river, three were landed out of the first freight, and one man went back for the rest.

The following may serve as a specimen of their language,

Though it appeared evident, that the natives of these islands waged war with each other, by the weapons they possessed, yet not a wound received from their enemies appeared on any part of their bodies.

C H A P. X.

The Endeavour continues her voyage from South Wales to New Guinea—An account of incidents upon landing there—She proceeds from New Guinea to the island of Savu—Transactions at this isle—Its produce and inhabitants, with a specimen of their language—Run from Savu to Batavia—Transactions while the Endeavour was refitting at this place.

ON the 23d of August, 1770, in the afternoon, after leaving Booby Island, we had light airs till five o'clock, when it fell calm, and we came to an anchor in eight fathom water, with a soft sandy bottom. On Friday, the 24th, soon after the anchor was weighed, we got under sail, steering N. W. and in a few hours one of the boats a-head made the signal for shoal-water. We instantly brought the ship to, with all her sails standing, and a survey being taken of the sea around her, it was found that she had met with another narrow escape, as she was almost encompassed with shoals, and was likewise so situated between them, that she must have struck before the boat's crew had made the signal, if she had been half the length of a cable on either side. In the afternoon we made sail with the ebb tide, and got out of danger before sun-set, when we brought to for the night.

On Sunday, the 26th, it was the Captain's intention to steer N. W. but having met with those shoals, we altered our course, and soon got into deep water. On the 27th we pursued our voyage, shortening sail at night, and tacking till day-break of the 28th, when we steered due N. in search of New Guinea. At this time our latitude by observation was 8 deg. 52 min. S. We here observed many parts of the sea covered with a kind of brown scum, to which our sailors gave the name of spawn. It is formed of an incredible number of minute particles, each of which, when seen through the microscope, was found to consist of a considerable number of tubes, and these tubes were subdivided into little cells. The scum being burnt, and yielding no smell like what is produced by animal substances, we concluded it was of the vegetable kind. This has often been seen on the coast of Brazil, and generally makes its appearance near the land. A bird called the Noddy was found this evening among the rigging of the ship. Land having been this day discovered from the mast head, we stood off and on all night, and at day-break we sailed towards it with a brisk gale. Between six and seven in the morning we had sight of a small low island, at about a league from the main, in latitude 80 deg. 13 min. S. and in longitude 221 deg. 25 min. W. and it has already been distinguished by the names of Bartholomew and Whermoyen. It appeared a very level island, clothed with trees, among which is the cocoa-nut; and we judged it to be inhabited by the smoke of the fires which were seen in different parts of it. The boats were now sent out to sound, as the water was shallow; but as the ship, in sailing two leagues, had found no increase in its depth, signals were made for the boats to return on board. We then stood out to sea till midnight, tacked, and stood in for land till the morning.

On Thursday, the 30th, when about four leagues distant, we had sight of it, and its appearance was

still flat and woody. Abundance of the brown scum was still seen on the surface of the sea, and the sailors, convinced that it was not spawn, gave it the whimsical name of sea-saw-dust. We now held a northward course, scarcely within sight of land, and as the water was but just deep enough to navigate the vessel, many unsuccessful attempts were made to bring her near enough to get on shore: it was therefore determined to land in one of the boats, while the ship kept plying off and on. In consequence of this resolution,

On Monday, Sept. the 3d, Capt. Cook, Mr. Banks, and Dr. Solander, attended by the boat's crew, and Mr. Banks's servant, set off from the ship in the pinnace, being in all twelve persons well armed. We rowed directly to the shore, but when come within two hundred yards of it, we found the water so shallow, that we were obliged to leave the boat, in the care of two of the sailors, and wade to land. We had no sooner reached the shore, than we saw several prints of human feet on the sand, below high water mark, from whence it was evident, that the natives had been there. We concluded they could be at no great distance, and as a thick wood came down within a hundred yards of the water, we proceeded with caution, that our retreat to the boat might not be cut off. We walked by the side of the wood, and came to a grove of cocoa-nut trees, not far from which was a shed, or hut, which had been covered with leaves, and near it lay a number of fresh shells of the fruit. At a small distance from this place we found plantains; and having now advanced about a quarter of a mile from the boat, three Indians rushed out of the wood with a hideous shout, at about the distance of a hundred yards; and as they ran towards us, the foremost threw something out of his hand, which flew on one side of him, and burnt exactly like gun-powder, but made no report; and the other two threw their lances at us. No time was to be lost; we discharged our pieces, loaded with small shot only; which we imagine they did not feel; for, without retreating, they cast a third dart: we therefore now loaded with ball, and fired a second time. It is probable some of them were wounded, as they all took to their heels with great agility. We improved this interval, in which the destruction of the natives was no longer necessary to our own defence, and with all expedition returned to our boat. In the way we perceived signals on board, that more Indians were coming down in a body; and before we got into the water, we perceived several of them coming round a point at the distance of about five hundred yards. When they saw us they halted, and seemed to wait till their main body should join them. They continued in this station, without giving us any interruption, while we entered the water, and waded toward the boat. We now took a view of them at our leisure. They made much the same appearance

pearance as the New Hollanders, being nearly of the same stature, and having their hair short cropped. They were also like them stark naked. During this time they were shouting at a distance, and letting off their fires, which seemed to be discharged by a short piece of stick, probably a hollow cane, this being swung sideways, produced fire and smoke like that occasioned by a musquet. The crew on board the ship saw this strange appearance, and thought the natives had fire arms. Those who went out in the boat, and had rowed a-breast of them, fired some musquets above their heads, the balls of which being heard by the natives rattling among the trees, they retired very deliberately, and our people in the boat returned to the ship. Upon examining the lances that had been thrown at us, we found they were made of a reed, or bamboo cane, the points of which were of hard wood, and barbed in many places. They were light, ill made, and about four feet long. Such was the force with which they were discharged, that they went beyond us, though we were at sixty yards distance, but in what manner they were discharged we could not determine; probably they might be thrown with a stick, in the manner practiced by the New Hollanders. This place is in latitude 6 deg. 15 min. S. The whole coast of this country is low land, but covered with a luxuriance of wood and herbage beyond description beautiful. The cocoa-nut, bread-fruit, and plantain tree, all flourished here in the highest perfection, besides most of the trees, shrubs, and plants, that are common to the South Sea islands. This day, Monday, Sept. the 3d, we made sail to the westward, being resolved to spend no more time upon this coast; but before we got under sail, some of the officers strongly urged the Captain to send a party of men on shore, to cut down the cocoa-nut trees, for the sake of the fruit. This Capt. Cook, with equal wisdom and humanity, peremptorily refused, as unjust and cruel; sensible that the poor Indians, who could not brook even the landing of a small party on their coast, would have made a vigorous effort to defend their property had it been invaded; consequently many must have fallen a sacrifice on their side, and perhaps some of our own people. "I should," (says Capt. Cook) have regretted the necessity of such a measure, if I had been in want of the necessities of life; and certainly it would have been highly criminal when nothing was to be obtained but two or three hundred green cocoa-nuts; which would at most have procured us a mere transient gratification. I might indeed have proceeded farther along the coast to the northward, or westward, in search of a place where the ship might have lain so near the shore, as to cover the people with her guns when they landed; but this would have obviated only part of the mischief, and though it might have secured us, it would probably in the very act have been fatal to the natives. Besides, we had reason to think that before such a place could have been found, we should have been carried so far to the westward as to have been obliged to go to Batavia, on the north side of Java, through the streights of Sunday: the ship also was so very leaky that I doubted whether it would not be necessary to leave her down at Batavia, which was another reason for making the best of our way to that place, especially as no discoveries could be expected in seas which had already been navigated, and where every coast had been laid down by the Dutch geographers."

On Saturday the 8th, we passed too small islands, on one of which Capt. Cook would have landed, but having only ten fathom water, the ground being also rocky, and the wind blowing fresh, we might have endangered the safety of the ship. We now sailed at a moderate rate till next morning at three o'clock; after which we had no ground with 120 fathoms. Before noon we had sight of land, which was conjectured to be either the Arrou Islands, or Timor Laoet. We were now in latitude 9 deg. 37 min. S. and in longitude 233 deg. 54 min. W. We stood off and on during the night, and on Wednesday the 12th, we saw a number of fires and smoke in several places, from whence it was con-

jectured that the place was well peopled. The land near the shore was covered with high trees, not unlike pines; farther back were cocoa-trees and mangroves; there were many salt-water creeks, and several spots of ground which appeared to have been cleared by art; and the whole country rose, by gradual slopes, into hills of a very considerable height. The land and sea breezes being now very slight, we continued in sight of the island for two days, when it was observed that the hills reached in many places quite to the sea-coast, and where that was not the case, there were large and noble groves of the cocoa-nut tree, which ran about a mile up the country, at which distance great numbers of houses and plantations were seen; the plantations were surrounded with fences, and extended nearly to the summits of the most lofty hills, yet neither the natives nor cattle were seen on any of them, which was thought a very extraordinary circumstance. Fine groves of the fan palm shaded the houses from the rays of the sun.

On the 16th, we had sight of the little island called Rotte; and the same day saw the island Semau, at a distance to the southward of Timor. The island of Rotte is chiefly covered with bushy wood without leaves; but there are a number of fan palm trees on it, growing near the sandy beaches; and the whole consists of alternate hills and valleys. The island of Semau is not so hilly as Timor, but resembles it greatly in other respects. At ten o'clock this night a dull reddish light was seen in the air, many parts of which emitted rays of a brighter colour, which soon vanished and were succeeded by others of the same kind. This phenomenon, which reached about ten degrees above the horizon, bore a considerable resemblance to the Aurora Borealis, only that the rays of light which it emitted had no tremulous motion: it was surveyed for two hours, during which time its brightness continued undiminished. As the ship was now clear of all the islands which had been laid down in such maps as were on board, we made sail during the night, and were surprised the next morning at the sight of an island to the W. S. W. which we flattered ourselves was a new discovery. Before noon we had sight of houses, groves of cocoa-nut trees, and large flocks of sheep. This was a welcome sight to people whose health was declining for want of refreshment, and it was instantly resolved to attempt the purchase of what we stood so much in need of. The second lieutenant was immediately dispatched in the pinnace, in search of a landing-place; and he took with him such things as it was thought might be acceptable to the natives.—During Mr. Gore's absence, the people on board saw two men on horseback upon the hills, who frequently stopped to take a view of the vessel. The lieutenant soon returned with an account that he had entered a little cove, near which stood a few houses; that several men advanced and invited him to land; and that they conversed together so well as they could by signs. He reported that these people were very like the Malays, both in person and dress; and said they had no other arms but a knife which each of them wore in his girdle.

The lieutenant not being able to find any place in which the ship might come to anchor, he was dispatched again with money and goods to buy such necessities as were immediately wanted for the sick. Dr. Solander attended the lieutenant, and during their absence, the ship stood on and off the shore. Soon after the boat had put off, two other horsemen were seen from the ship, one of whom had a laced hat on, and was dressed in a coat and waistcoat, of the fashion of Europe. These men rode about on shore taking little notice of the boat, but regarding the ship with the utmost attention. As soon as the boat reached the shore, some other persons on horseback, and many on foot hastened to the spot, and it was observed that some cocoa-nuts were put into the boat, from whence it was concluded, that a traffick had commenced with the natives. A signal being made from the boat that the ship might anchor in a bay at some distance, the immediately bore away for it. When the lieutenant came

T

on

on board, he reported, that he could not purchase any cocoa-nuts, as the owner of them was absent, and that what he had brought were given him, in return for which he had pressed the natives with some linen. The method by which he learned that there was a harbour in the neighbourhood, was by the natives drawing a kind of rude map on the sand, in which the harbour, and a town near it, was represented; it was likewise hinted to him, that fruit, fowls, hogs, and sheep might be there obtained in great abundance. He saw several of the principal inhabitants of the island, who had chains of gold about their necks, and wore fine linen. The word Portuguese being frequently repeated by the Indians, it was conjectured that some natives of Portugal were in the island, and one of the boat's crew being of that kingdom, he spoke to the islanders in his own language, but soon found that they had only learned a few words, of which they did not know the meaning. While the natives were endeavouring to represent the situation of the town near the harbour, one of them, in order to be more particular in directions, informed the English that they would see something which he endeavoured to describe by placing his fingers across each other; and the Portuguese sailor took it for granted, that he could mean nothing but a cross. When the boat's crew were on the point of returning to the ship, the gentleman who had been seen on horseback in the dress of Europe, came down to the beach; but the lieutenant did not think it proper to hold a conference with him, because he had left his commission on board the ship.

When the ship had entered the bay, in the evening, according to the directions received, an Indian town was seen at a distance; upon which a jack was hoisted on the fore-top-mast head, presently afterwards three guns were fired, and Dutch colours were hoisted in the town; the ship, however, held on her way, and came to an anchor at seven in the evening. The colours being seen hoisted on the beach the next morning, the captain concluded, that the Dutch had a settlement on the island, he therefore dispatched the second lieutenant to acquaint the governor, or other principal resident, who they were, and that the ship had put in for necessary refreshments. The lieutenant having landed, he was received by a kind of guard of something more than twenty Indians, armed with muskets, who after they had taken down their colours from the beach, proceeded without the least military order; and thus escorted him to the town, where the colours had been hoisted the preceding evening. The lieutenant was now conducted to the Raja, or king of the island, to whom, by means of a Portuguese interpreter, he made known his business. The Raja said, he was ready to supply the ship with the necessary refreshments, but that he could not trade with any other people than the Dutch, with whom he was in alliance, without having first obtained their consent; he added, however, that he would make application to the Dutch agent, who was the only white man among them. To this agent, whose name was Lange, and who proved to be the person that was seen from the ship in the European dress, a letter was dispatched, and in a few hours he came to the town, behaved politely to the lieutenant, and told him he might buy what he thought proper of the inhabitants of the island. This offer being freely made, and readily accepted, the Raja and Mr. Lange intimated their wishes to go on board the ship, and that two of the boat's crew might be left as hostages for their safe return. The lieutenant gratified them in both these requests, and took them on board just before dinner was served. It was thought that they would have sat down without ceremony; but now the Raja intimated his doubts, whether being a black, they would permit him to sit down with them. The politeness of the officers soon removed his scruples, and the greatest good humour and festivity prevailed among them. As Dr. Solander and another gentleman on board, were tolerable proficient in Dutch, they acted as interpreters between Mr. Lange and the officers, while some of the sailors, who understood Portuguese, conversed with

such of the Raja's attendants as spoke that language. Our dinner consisted chiefly of mutton, which when the Raja had tasted, he requested of us an English sheep, and the only one we had left was presented to him. Our complaisance in this particular, encouraged the king to ask for an English dog, and Mr. Banks politely gave him his greyhound. A spying-glass was also put into his hand; Mr. Johan Christopher Lange having intimated, that such a present would be very acceptable. Our visitors now informed us, that the island abounded with buffaloes, sheep, hogs, and fowls, plenty of which should be driven down to the shore the next day. This put us all in high spirits, and the liquor circulated rather faster than either the Indians or the Saxon could bear; but they had, however, the resolution to express a desire to depart, before they were quite intoxicated. When they came upon deck, they were received in the same manner as when they came aboard, by the marines under arms; and the Raja expressing a desire to see them exercise, his curiosity was gratified. They fired three rounds. The king observed them with great attention, and appeared much surprized at the regularity and expedition of their manœuvres. When they cocked their firelocks, he struck the side of the ship with his stick, exclaiming at the same time violently, "that all the locks made but one click." They were dismissed with many presents, and on their departure were saluted with nine guns. Mr. Banks with Dr. Solander accompanied them, and when they put off returned our compliments with three cheers. Our gentlemen on their arrival at the town, tasted their palm-wine, which was the fresh juice of the trees, unfermented. It had a sweet, but not disagreeable taste, and hopes were entertained, that it might contribute to recover our sick from the scurvy. The houses of the natives consisted of only a thatched roof, supported over a boarded floor, by pillars about four feet high.

Wednesday the 19th, in the morning, Capt. Cook, attended by several gentlemen, went on shore to return the Raja's visit; but their principal intention was to purchase the cattle and fowls, which they had been assured the preceding day should be driven down to the beach. We were greatly chagrined at finding no steps had been taken to fulfil this promise: however, we proceeded to the house of assembly, which, with a few other houses, built by the Dutch East-India Company, are distinguished from the rest, by having two pieces of wood, resembling a pair of cows horns, fixed at each end of the roof; and these we concluded to be what the Portuguese sailor construed into crosses, from the Indian having crossed his fingers when he was describing the town. At the house of assembly we saw Mr. Lange and the Raja, whose name was A Madocho Lomi Djara, surrounded by many of the principal people; Capt. Cook having informed them, that he had loaded his boat with goods, which he wished to exchange for necessary refreshments, permission was given him to land them. We now endeavoured to make an agreement for the hogs, sheep, and buffaloes, which were to be paid for in cash; but this business was no sooner hinted than Mr. Lange took his leave, having first told the captain, that he had received a letter from the governor of Concordia, in Timor, the contents of which should be disclosed at his return. As the morning was now far advanced, and we had no fresh provisions on board, we requested the Raja's permission to buy a small hog and some rice, and to order his people to dress the dinner for us. He very obligingly replied, that if we could eat victuals dressed by his subjects, which he could scarcely suppose, he would do himself the honour of entertaining us. A dinner being thus procured, the captain sent off his boat to bring liquors from the ship. It was ready about five o'clock, and after we were seated on mats, which were spread on the floor, it was served in six and thirty baskets. We were then conducted by turns to a hole in the floor, near which stood a man with water in a vessel, made of the leaves of the fan-palm, who assisted us in washing our hands. This done we returned to our places and expected the king. Having waited some time, we enquired the reason of his absence,

absence, and were informed that the person who gave the entertainment never partook of it with his guests; but that the Raja was ready to come and taste of what was provided, if we entertained a thought that the victuals were poisoned. We declared that we did not harbour any such suspicion, and desired that the custom of the country might not be violated on our account. When dinner was ended, the wine passed briskly, and we invited the Raja to drink with us, thinking if he would not eat with us, he might at least share in the jollity of the bottle; but he again excused himself, saying, the man who entertained his guests should never get drunk with them, and that the surest way to avoid this was to refrain from tasting the liquor. The prime minister and Mr. Lange were of our party, and we made a most luxurious meal. The pork and rice were excellent, and the broth not to be despised; but the spoons, made of leaves, were so small, that few of us had patience to use them. We did not drink our wine at the place where we had dined; and the remains of the dinner we left to the seamen and servants, who immediately took our places. They could not dispatch all we had left; but the Raja's female servants, who came to take away the utensils, obliged them to carry away what they had not eaten. When we thought the wine had so far operated as to open the heart, we took an opportunity to enquire after the buffaloes and sheep, of which we had not in all this time heard a syllable, though they were to have been at the beach early in the morning. Mr. Lange, the Saxon Dutchman, now began to communicate to us the contents of the letter, which he pretended to have received from the governor of Concordia, and wherein he said, instructions were given, that if the ship should touch at this island, and be in want of provisions, she should be supplied; but he was not to permit her to remain longer than was necessary; nor were any large presents to be made to the natives of low rank, nor to be even left with their superiors to be divided among them after the ship had sailed; but he added, any trifling civilities received from the Indians might be acknowledged by a present of beads, or other articles of very small value. It is probable that the whole of this story was a fiction; and that by precluding our liberality to the natives, the Saxon Dutchman hoped more easily to draw all the presents of any value into his own pocket. In the evening we were informed, that only a few sheep had been brought to the beach, which had been driven away before our people could procure money from the ship to pay for them. Some fowls however were bought, and a large quantity of a kind of syrup made of the juice of the palm-tree. This, though infinitely superior to molasses or treacle, sold at a very low price. Vexed at being thus disappointed in purchasing the chief articles most wanted, we remonstrated with Mr. Lange, who now found another subterfuge. He said, had we gone down to the beach ourselves, we might have purchased what we pleased; but that the natives were afraid of being imposed on by our seamen with counterfeit money. We could not but feel some indignation against a man who had concealed this, being true; or alledged it, being false; and Capt. Cook repaired immediately to the beach, but no cattle were to be seen, nor were any at hand to be bought. During his absence, Lange told Mr. Banks, that the Indians were offended at our not having offered them gold for what we had to sell, and without which nothing could be bought. Mr. Banks did not think it worth his while to hold farther conversation with a man who had been guilty of such repeated falsities; but rose up suddenly, and we all returned on board much dissatisfied with our fruitless negotiations. The Raja had indeed given a more plausible reason for our disappointment: he said, the buffaloes being far up in the country, there had not been time to bring them down to the beach.

On Thursday the 20th, Dr. Solander went again ashore with Capt. Cook, and while the former went up to the town to speak to Lange, the captain remained on the beach with a view of purchasing provisions. Here he met with the old Indian, who, as he appeared to

have some authority, we had among ourselves distinguished by the name of the Prime Minister. In order to engage this man in our interest, the captain presented him with a spying-glass; but only a small buffalo was offered to be sold. The price was five guineas, nearly twice its real value. Three, however, were offered, which the dealer thought a good price; but said, he must acquaint the king with what had been bid before he could strike the bargain. A messenger was immediately dispatched to the Raja, and on his return brought word, that not less than five guineas would be taken for the buffalo. The captain absolutely refused to give the sum demanded, which occasioned the sending away a second messenger, and during his absence, Dr. Solander was seen coming from the town, followed by above a hundred men, some of whom were armed with muskets, and others with lances. Upon enquiring into the meaning of this hostile appearance, the doctor informed us, the purport of a message from the king was, according to Mr. Lange's interpretation, that the people would not trade with us because we had refused to give them more than half the value for their commodities; and that we were not to expect permission to trade upon any terms longer than this day.

A native of Timor, whose parents were Portuguese, came down with this party, and delivered to the captain what was pretended to be the order of the Raja, and which was in substance the same that Lange had told Dr. Solander; but it was afterwards discovered that this man was a confidant of Lange's in the scheme of extortion. The English gentlemen had at the same time no doubt, but that the supposed order of the Raja was a contrivance of these men, and while they were debating how to act in this critical conjuncture, anxious to bring the affair to a speedy issue, the Portuguese began to drive away such of the natives as had brought palm-syrup and fowls to sell, and others who were now bringing sheep and buffaloes to the market. At this juncture Capt. Cook happening to look at the old man who had been distinguished by the name of prime minister, imagined that he saw in his features a disapprobation of the present proceedings; and, willing to improve the advantage, he grasped the Indian's hand, and gave him an old broadsword. This well-timed present produced all the good effects that could be wished; the prime minister was enraptured at so honourable a mark of distinction, and brandishing his sword over the head of the impertinent Portuguese, he made both him and a man who commanded the party, sit down behind him on the ground. The whole business was now accomplished; the natives, eager to supply whatever was wanted, brought their cattle in for sale, and the market was soon stocked. For the first two buffaloes, Capt. Cook gave ten guineas: but he afterwards purchased them by way of exchange, giving a musket for each, and at this rate he might have bought any number he thought proper. There remained no doubt but that Lange had a profit out of the two that were sold; and that his reason for having said the natives would take nothing but gold for their cattle, was, that he might the more easily share in the produce. Capt. Cook purchased of the natives of this island some hundred gallons of palm-syrup, a small quantity of garlick, a large number of eggs, some limes and cocoa-nuts, thirty dozen of fowls, three hogs, six sheep, and nine buffaloes. We having obtained these necessary articles, now prepared for sailing from this place.

The island of Savu is situated in 10 deg. 35 min. S. latitude, and 237 deg. 30 min. W. longitude. Its length is between twenty and thirty miles. But its breadth Capt. Cook could not ascertain, as he only saw the north side of it. The harbour in which the ship lay, was called Seba, from a district of the country so denominated; and there are two other bays on different parts of the island. At the time the Endeavour lay there it was near the end of the dry season, when it had not rained for almost seven months, nor was there a running stream of fresh water to be seen, and the natives were supplied only by small springs, situated at a distance up the country, yet even in this dry season the appearance

appearance of the island was beautiful. Near the coast the land lies level, and well clothed with palm, called Arecao, and cocoa-nut trees. Farther off, the ground rises in the most gradual ascent, and is covered with fair palm-trees even to the tops of the hills, so as to present a regular grove to the view. The rains in this country cease in March or April, and fall again in October or November, and these rains produce abundance of indico, millet, and maize, which grow beneath the finest trees in the country. Besides these articles, the island produces tobacco, cotton, betel, tamarinds, limes, oranges, mangoes, guinea corn, rice, callevances, and water-melons. A small quantity of cinnamon was seen, and some European herbs, such as garlick, fennel, celery, and marjoram, besides which, there are fruits of various kinds, and particularly the blimbi, which has a sharp taste, and is a fine pickle, but it is not eaten raw; its length is from 3 to 4 inches; it is nearly as thick as a man's thumb, of an oval form, covered with a very thin skin, of a very light green, and contains a number of seeds ranged in the shape of a star. Several buffaloes were seen on this island which were almost as large as an ox; and from a pair of enormous horns of this animal, which Mr. Banks saw, it was supposed that some of them were much larger; yet they did not weigh more than half as much as an ox of the same size; having lost the greater part of their flesh through the late dry weather: the meat however was juicy, and of a delicate flavour. The horns of these animals bend backwards; they had no dew-laps, and scarce any hair on their skins, and their ears were remarkably large. The other tame animals on the island are dogs, cats, pigeons, fowls, hogs, goats, sheep, asses, and horses. Few of the horses are above twelve hands high, yet they are full of mettle, and pace naturally in an expeditious manner: the natives ride them with a halter only. The hogs of this country are fed on the husks of rice and palm-syrup mixed with water, and are remarkably fine and fat. The sheep is not unlike a goat, and are therefore called Cabaritos; their ears, which are long, hang down under their horns; their noses are arched, and their bodies covered with hair. The fowls are of the game kind, and though they are rather large, the hen lays a very small egg. The sea-coast furnishes the inhabitants with turtle, but not in any great abundance.

The people of this island are rather below the middle stature; their hair is black and strait, and persons of all ranks, as well those that are exposed to the weather, as those that are not, have one general complexion, which is the dark brown. The men are well formed and sprightly, and their features differ much from each other: the women, on the contrary, have all one set of features, are very short, and broad built. The men have silver pincers hanging by strings round their necks, with which they pluck out the hair of their beards; and both men and woman root out the hair that grows under their arms; the hair of the women's heads is tied in a club behind, while the men wear a kind of turban on their heads, formed of muslin, cotton, or even with silk handkerchiefs, but the heads of the women have no covering. The dress of the men consists of two pieces of cotton cloth, one of which is bound round the middle, and the lower edge of it being drawn pretty tight between the legs, the upper edge is left loose, so as to form a kind of pocket, in which they carry knives and other things: the other piece being past under the former on the back of the wearer, the ends of it are carried over the shoulders, and tucked into the pocket before. The women drew the upper edge of the piece round the waist tight, while the lower edge dropping to the knees, make a kind of petticoat: the other piece of cloth is fastened across the breast, and under the arms. This cloth, which is manufactured by the natives, is dyed blue while in the yarn; and as it is of various shades, its look, when it comes to be worn, is very beautiful.

Their ornaments are very numerous, and consist of rings, beads worn round the neck and on the wrists, and chains of plaited gold wire, are likewise worn by

both sexes; but the women had likewise girdles of beads round their waists, which served to keep up their petticoats. Both sexes had their ears bored without a single exception, that we saw, but we never observed an ornament in any of them. Nor did we perceive either man or woman in any thing but what appeared to be their ordinary dress, except the king and his minister, who in general wore a kind of night-gown of coarse chintz, and the latter once received us in a black robe, which appeared to be made of prince's stuff. One person, in the way of finery, had a silver-headed cane, marked with a kind of cypher, consisting of the Roman letters V. O. C. which might have been a present from the Dutch East-India Company, whose mark it is. We also saw boys about twelve or fourteen years old, having spiral circles of thick brass wire passed three or four times round their arms, above the elbow; and upon the same part of the arm, some of the men had rings of ivory, two inches broad, and about one in thickness; these we were informed were the sons of the Raja's or chiefs, whose high births were distinguished by these cumbersome ornaments. Most of the men had their names marked on their arms, and the women had a square ornament of flourished lines imprinted just under the bend of the elbow. On enquiry it was found that this practice had been common among the Indians long before they were visited by any Europeans; and in the neighbouring islands, it was said, the inhabitants were marked with circles upon their necks and breasts. We were struck with the similitude between these marks, and those made by tattooing in the South Sea islands; and M. Boffu's account of some Indians who dwell on the banks of Akanza, a river in North America, which falls into the Mississippi, will afford a probable conjecture how the operation is performed. "The Alkanzas, says he, have adopted me, and as a mark of my privilege, have imprinted the figure of a roe-buck upon my thigh, which was done in this manner: an Indian having burnt some straw, diluted the ashes with water, and with this mixture, drew the figure upon my skin; he then retraced it, by pricking the lines with needles, so as at every puncture just to draw the blood, and the blood mixing with the ashes of the straw, forms a figure which can never be effaced."

The houses of Savu are all built upon the same plan, but differ in size, according to the rank and wealth of the proprietors, being from twenty feet to four hundred, and they are fixed on posts of about four or five feet from the ground. One end of these is driven into the ground, and upon the other is laid a floor of wood, which makes a vacant space of four feet between the floor of the house and the ground. On this floor are raised other pillars that support a roof of sloping sides, which meet in a ridge at the top, like those of our barns; the eaves of this roof, which is thatched with palm leaves, reach within two feet of the floor, and over-hang it as much. The space within is generally divided lengthwise into three equal parts; the middle part, or center, is inclosed by a partition of four sides, reaching about six feet above the floor, and one or two small rooms are also sometimes taken off from the sides; the rest of the space under the roof is open, so as freely to admit the air and light. The particular uses of these apartments we could not, during our short stay, learn, except that the close room in the center was appropriated to the women.

As to the food of these people, they eat all the tame animals to be found in the island; but they prefer the hog to all others; next to this they admire horse-flesh; to which succeeds the buffalo, then poultry; and they prefer cats and dogs to goats and sheep. Fish, we believe, is not eaten but by the poor, nor by them, except when their duty or business requires them to be upon the beach, and then each man has a light casting net, which is girt round his body, and with this he takes any small fish which may come in his way.

The most remarkable and useful tree that grows on the island is the fan palm. Its uses are so various, that it requires particular notice. At certain times it is a succedaneum for all other food both to man and beast.

A kind

A kind of wine, called toddy, is extracted from this tree, by cutting the buds, and tying under them small baskets, made of the leaves. The juice which trickles into these vessels is collected morning and evening, and is the common drink of all the inhabitants. The natives call this liquor *dua* or *duac*, and both the syrup and sugar, *gula*. The syrup is not unlike treacle, but is somewhat thicker, and has a more agreeable taste. The sugar is of a reddish brown, probably the same with the *Jugata fugata* sugar upon the continent of India, and to our taste it was more agreeable than any cane sugar, unrefined. We at first apprehended that the syrup, of which some of our people eat great quantities, would have occasioned fluxes, but what effect it produced was rather salutary than hurtful. This syrup is used to fatten hogs, dogs, and fowls; and the inhabitants themselves have subsisted upon this alone for several months, when other crops have failed, and animal food has been scarce. With the leaves of this tree the natives thatch their houses, and make baskets, cups, umbrellas and tobacco-pipes. They make least account of the fruit, and as the buds are wounded for the tuac or toddy, there is very little produced. It is nearly of the size of a full grown turnip; and the kernels must be eaten before it is ripe, otherwise they are so hard, that the teeth will not penetrate them.

As fire-wood is very scarce, the natives, by the following method, make a very little answer the ends of cookery and distillation. A hollow is dug underground, like a rabbit burrow, in a horizontal direction, about two yards long, with a hole at each end, one of which is large, and the other small. The fire is put in at the large hole, and the small one serves for a draught. Circular holes are made through the earth which covers this cavity, on which are set earthen pots, large in the middle, and smaller towards the bottom, so that the fire acts upon a large part of the surface. They contain generally about eight or ten gallons each, and it is surprising to see with what a small quantity of fuel they are kept boiling. In this manner they boil all their victuals, and make all their syrup and sugar. The Peruvian Indians have a contrivance of the same kind; and perhaps by the poor in other countries it might be adopted with advantage.

In this island both sexes are enslaved by the pernicious custom of chewing beetle and areca, contracted even while they are children. With these they mix a sort of white lime, composed of coral stones and shells, to which is added frequently a small quantity of tobacco, whereby their mouths are rendered disgusting both to the sight and the smell; for the tobacco infects their breath, and the beetle and lime make the teeth both black and rotten. We saw many of both sexes whose fore teeth were consumed, irregularly, almost down to the gums, and corroded like iron by rust. This loss of teeth has generally been attributed to the tough stringy coat of the areca nut; but our gentlemen imputed it wholly to the lime; for the teeth are not loosened or broken, as might be the case by chewing of hard and rough substances, but they are gradually wasted, as even metals are by powerful acids; and they may not be mistaken who suppose that sugar has a bad effect upon the teeth of Europeans, seeing refined sugar contains a considerable quantity of lime, and it is well known, that lime will destroy bone of any kind. When the natives are at any time not chewing beetle and areca, they then are smoking. The manner of doing this is by rolling up a small quantity of tobacco, and putting it into one end of a tube, about six inches long, as thick as a goose quill, and made of a palm-leaf. The women in particular were observed to swallow the smoke.

The island is divided into five districts or *nigrees*, each of which is governed by a Raja. These are called *Laai*, *Seba*, *Regeewa*, *Timo*, and *Massara*. We went ashore at *Seba*, and found a Raja that governed with absolute authority. He was about five and thirty, and the most corpulent man we had seen upon the whole island. But though he governed with an unlimited authority, he took very little regal pomp upon him.

No. 9.

He was directed almost implicitly by *Mannu Djarme*, the old man, his prime minister, already mentioned; yet notwithstanding the power with which he was invested, he was universally beloved, a sure proof that he did not abuse it. Mr. Lange informed Capt. Cook, that the chiefs who had successively presided over the five principalities of this island, had lived for time immemorial in the most cordial friendship with each other; yet, he said, the people were of a warlike disposition, and had always courageously defended themselves against foreign invaders. We were told also, that the inhabitants of the island could raise, on a short notice, 7,300 fighting men armed with muskets; of which number *Laai* was said to furnish 2,600, *Seba* 2000, *Regeewa* 1,500, *Timo* 800, and *Massara* 400. Besides the arms already mentioned, each man is furnished with a large maffy pole-ax, which, in the hands of people who have courage, must be a formidable weapon. In the use of their lances these people are said to be so expert, that they can pierce a man through the heart at sixty or seventy yards distance: yet the Raja had always lived at peace with his neighbours. This account of the martial prowess of the inhabitants of *Savu* may be true; but during our stay we saw no appearance of it. Before the town house indeed, we saw about one hundred spears and targets, which served to arm those who were sent down to intimidate us at the trading place, but they seemed to be the refuse of old armories, no two being of the same make or length, for some were six, others sixteen feet long. Not one lance was among them, and though the muskets were clean on the outside, within they were eaten by the rust into holes; and the people themselves appeared to be so little acquainted with military discipline, that they came down like a disorderly rabble, every one having a cock, some tobacco, or other merchandize, and few or none of their cartouch boxes were furnished with either powder or ball, but a piece of paper was thrust into the holes to save appearances. We likewise saw before the house of assembly a great gun, some swivels, and *patararoes*: but the great gun lay with the touch-hole to the ground, and the swivels and *patararoes* were not in their carriages.

The inhabitants of *Savu* are divided into five ranks, namely, the *Rajas*, the land owners, the manufacturers, the servants, and the slaves. The *Rajas* are chief; the land owners are respected in proportion to their estates, and the number of their slaves, which last are bought and sold with their estates; but a fat hog is the price of one if purchased separately. Notwithstanding a man may thus sell his slave, or convey him with his lands, yet his power does not extend farther, as he may not even strike him without the Raja's permission. The estates of these land-holders are of very different extent: some of them not possessing above five slaves, whilst others have 500. When a man of rank goes abroad, one of his slaves follows him with a silver hilted sword or hanger, ornamented with horse hair tassels, and another carries a little bag containing tobacco, beetle, areca, and lime. This is all the state that even the *Rajas* themselves take upon them.

These people have a great veneration for antiquity. Their principal boast is of a long line of venerable ancestors. Those houses that have been well tenanted for successive generations, are held in the highest esteem; even the stones which are worn smooth by having been sat upon for ages, derive a certain value from that circumstance. He whose progenitors have bequeathed him any of these stones, or whose wealth has enabled him to purchase them, causes them to be ranged round his habitation, for his servants and slaves to sit upon. The Raja causes a large stone to be set up in the chief town of each district as a monument of his reign. In the province of *Seba*, thirteen such stones were seen as well as the remains of several others which were much worn. These stones were all placed on the top of a hill, and some of them were of such an enormous size that it was amazing by what means they could have been brought thither; nor could any information on this head be obtained from the natives: these

U

these monuments, however, indicated that for a series of generations, the island had been regularly governed.— When a Raja dies, proclamation is made that all those who have been his subjects shall hold a solemn festival. On this they proceed to the hill where these stones are erected, and feast for several weeks, killing all the animals that suit their purpose, wherever they can be found, in order to furnish the treat, which is daily served up on the monumental stones. When they have thus exhausted their whole stock, they are compelled to keep a fast; and when the feast happens to end in the dry season, when they cannot get vegetables to eat, they have no other subsistence than the palm syrup and water, till the few animals which have escaped the general massacre have bred a sufficient number for a fresh supply, except the adjacent district happens to be in a condition to relieve them.

The natives of Savu have an instrument with which they clear the cotton of its seeds; it is about seven inches in height and fourteen in length. They have also a machine with which they spin by hand, as was the custom before the invention of spinning wheels in Europe.

The inhabitants of this island were in general robust and healthy, and had every mark of longevity. The small pox, however, is a distemper with which they are acquainted, and which they dread as much as a pestilence. When any person is attacked by it, he is carried to a spot at a distance from the houses, where his food is conveyed to him by means of a long stick, as no one dares to venture near him. Abandoned by all his friends, he is there left to live or die as it may happen, without being admitted to any comforts of the community.

The Portuguese very early visited this island, on which they established a settlement, but soon after they were succeeded by the Dutch, who without formally taking possession of the place, sent a number of trading vessels in order to establish a commerce with the natives. Most of the Dutch purchases, it is supposed, are confined to a supply of provisions for the Spice-Islands, the inhabitants of which breed but a small number of cattle. The Dutch East India Company made an agreement with the several Rajas of the islands, that a quantity of rice, maize, and callavances should be annually furnished to their people, who, in return, were to supply the Rajas with silk, linen, cutlery wares, and arrack. Certain small vessels, each having on board ten Indians, are sent from Timor to bring away the maize and callavances, and a ship that brings the articles furnished by the Dutch, receives the rice on board once a year; and as there are three bays on this coast, this vessel anchors in each of them in turn. The Dutch articles of commerce are accepted by the Rajas as a present; and they and their chief attendants drink of the arrack without intermission till it is exhausted.

It was in the agreement above-mentioned that the Rajas stipulated, that a Dutch resident should be constantly on the island. Accordingly this Lange, whom we have mentioned, was sent thither in that capacity, and a fort of assistant with him, whose father was a Portuguese, and his mother a native of Timor, with one Frederic Craig, whose father was a Dutchman, and his mother an Indian. Mr. Lange visits the Raja in state, attended by fifty slaves on horse-back, and if the crops are ripe, orders vessel to convey them immediately to Timor, so that they are not even housed upon the island. It is likewise part of his business to persuade the landholders to plant, if he perceives that they are backward in that particular. This resident had been ten years on the island, when the Endeavour touched there, during all which time he had not seen any white persons, except those who came annually in the Dutch vessel, to carry off the rice, as above-mentioned. He was married to a native of Timor, and lived in the same manner as the natives of Savu, whose language he spoke better than any other. He sat on the ground like the Indians, and chewed betle, and seemed in every thing to resemble them, except in his complexion and

the dress of his country. As to Mr. Craig, his assistant, he was employed in teaching the natives to write and read, and instructing them in the principles of Christianity. Though there was neither clergyman nor church to be seen upon the island, yet this Mr. Craig averred, that in the township of Seba only, there were 600 Christians: as to the religion of those who have not embraced Christianity, it is a peculiar species of Paganism, every one having a god of his own, somewhat after the manner of the Cemies heretofore mentioned. Their morality, however, is much purer than could be expected from such a people. Robberies are scarcely ever committed. Murder is unknown among them; and though no man is allowed more than one wife, they are strangers to adultery, and almost so to the crime of simple fornication. When any disputes arise between the natives, the determination of the Raja is decisive and satisfactory. Some observations were made upon the language of the natives, by the gentlemen, while the vessel lay here; and a kind of vocabulary formed, a sketch of which we have here inserted:

Momonne,	-	<i>A man.</i>
Mobunne,	-	<i>A woman.</i>
Catoo,	-	<i>The head.</i>
Row catoo,	-	<i>The hair.</i>

It is here necessary to observe, that this island has not been laid down in any of the charts hitherto published, and as to our account of it, let it be remembered, that except the facts in which we were parties, and the account of the objects which we had an opportunity to examine, the whole is founded merely upon the report of Mr. Lange, upon whose authority it must therefore rest.

Of the islands in the neighbourhood of Savu, the principal is Timor, which is annually visited by the Dutch residents on the other islands, in order to make up their accounts. Some of the towns on the north side of Timor are in the hands of the Portuguese; but the Dutch possess a far greater proportion of the island, on which they have built a fort, and erected several store-houses. There are three small islands, called the Solars, which produce great abundance of the various necessities of life, that are carried in small vessels to the Dutch settlements on the island of Timor. These islands are low and flat, and one of them has a commodious harbour. To the westward of the Solars lies the little island of En'e, in the possession of the Portuguese, who have built a considerable town on the N. E. point of it; and close to the town is an harbour where ships may ride in safety. The island of Rotte has a Dutch resident, whose business is similar to that of Mr. Lange on the island of Savu. Rotte produces, besides such things as are common to other islands, a considerable quantity of sugar, which is made to a great degree of perfection. There is likewise a small island lying to the west of Savu, the chief produce of which is the areca nut, of which the Dutch receive in exchange for European commodities, as large a quantity every year as load two vessels.

About two years before the Endeavour was in these seas, a French ship was wrecked on the coast of Timor: she had been lodged on the rocks several days, when the wind tore her to pieces in an instant, and the Captain, with the greater part of the seamen were drowned; but the lieutenant and about eighty men, having reached the shore, travelled across the country of Concordia, where their immediate wants were relieved, and they afterwards returned to the wreck, in company with some Dutchmen and Indians, who assisted them in recovering all their chests of bullion, and other effects. This done they returned to Concordia, where they remained several weeks; but in this interval death made such havock among them, that not above half their number remained to return to their native country, which they did as soon as a vessel could be fitted out for them.

On Friday, the 21st of September, in the morning, we got under sail, and bent our course westward, along the north side of the island of Savu, and of another lying to the westward of it, which at noon bore S. S. E. distant two leagues. At four in the afternoon, in latitude 10 deg. 38 min. S. and longitude 238 deg. 28 min. W. we discovered a small low island. In the evening of the 23^d, we got clear of the islands, and on the 26th, our latitude by observation was 10 deg. 51 min. S. and our longitude 252 deg. 11 min. W. On the 28th, we steered all day N. W. with a view of making the land of Java, and on the 30th, Capt. Cook took into his possession the log-book and journals, at least all he could find of the officers, petty officers, and seamen, whom he strictly enjoined secrecy with respect to where they had been. At seven in the evening we had thunder and lightning, and about twelve by the light of the flashes we saw the west end of Java.

On Monday, October the 1st, at six o'clock in the

morning, Java Head bore S. E. by E. distant five leagues. Soon after we saw Prince's Island, and at ten Cracatoa, a remarkable high peaked island. At noon it bore N. 40 E. distant seven leagues. On the 2nd, we were close in with the coast of Java, in fifteen fathom water, along which we stood. In the forenoon a boat was sent ashore, in order to procure some fruit for Tupia, who was at this time extremely ill. Our people returned with four cocoa-nuts, and a small bunch of plantains, for which they had paid a shilling; but some herbage for the cattle the Indians gave our seamen, and assisted them to cut it. The country had a delightful appearance, being every where covered with trees, which looked like one continued wood. About eleven o'clock we saw two Dutch East Indiamen, from whom we heard with great pleasure, that the Swallow had reached the English channel in safety, having been at Batavia about two years before. We also learnt, that there was stationed here a fly boat or packet, to carry letters, as was said, from the Dutch ships, that came hither from Batavia, but the Captain thought it was appointed to examine all ships, that should have passed the strait. We had now been some hours at anchor, but in the evening a light breeze springing up, we got under sail, yet having little wind, and a strong current against us, we reached no further by eight in the morning, of the 3^d, than Bantam Point. We now perceived the Dutch packet standing after us, but the wind shifting to the N. E. she bore away. We were now obliged to anchor; which we did in twenty-two fathom water, at about two miles from the shore. At six o'clock in the evening, the country boats came along side of us, on board one of which was the master of the packet. They brought in them fowls, ducks, parrots, turtle, rice, birds, monkeys, and other articles, with an intention to sell them, but having fixed very high prices on their commodities, and our Savu stock being not yet expended, very few articles were purchased. The Captain indeed gave two dollars for twenty-five fowls, and a Spanish dollar for a turtle, which weighed about six and thirty pounds. We might also for a dollar have bought two monkeys, or a whole cage of rice-birds. The master of the packet brought with him two books, in one of which he desired of our officers, that one of them would write down the name of our ship and commander; the place from whence we came; to what port bound; with such other particulars relating to ourselves, as we might think proper, for the information of any of our countrymen who might come after us. In the other book the master himself entered the names of our ship and its Captain, in order to transmit them to the governor and council of the Indies. We perceived, that in the first book many ships, particularly Portuguese, had made entries of the same kind with that for which it was presented to us. Mr. Hicks, our lieutenant, however, having written the name of the ship, only added "from Europe." The master of the packet took notice of this, but said, that he was satisfied with any thing we thought fit to write, it being intended solely for the information of our friends.

Friday the fifth, we made several attempts to sail with a wind that would not stem the current, and as often came to an anchor. In the morning a proa, with a Dutch officer, came along-side of us, and sent to Captain Cook a printed paper in exceeding bad English, duplicates of which he had in other languages, all regularly signed, in the name of the governor and council of the Indies, by their secretary; the contents whereof were the following enquiries, contained in nine questions.

1. The ship's name, and to what nation she belonged?
2. If she came from Europe, or any other place?
3. From what place she had last departed?
4. Whereunto designed to go?
5. What and how many ships of the Dutch company by departure from the last shore there layed, and their names?

6. If

6. If one or more of these ships, in company with the Endeavour, is departed for this or any other place?

7. If during the voyage any particularities is happened, or seen?

8. If not any ships in sea, or the streights of Sunda, have seen, or hailed in, and which?

9. If any other news worth of attention, at the place from whence the ship lastly departed, or during the voyage, is happened?

BATAVIA in the Castle.

By order of the Governor General, and the
Counsellors of India,

J. BRANDER BUNGL. Sec.

The officer observing, that the Captain did not chuse to answer any of the above questions, except the first and fourth, he said that the rest were not material, though it was remarked that just afterwards he affirmed he must dispatch the paper to Batavia, at which place it would arrive by the next day. This examination was rather extraordinary, and the more so, as it does not seem to have been of any long standing.

As soon as the Dutch officer departed, the anchor was weighed, but in four hours the ship was forced to come to an anchor again, till a breeze sprang up; she then held on her course till the next morning, when on account of the rapidity of the current, the anchor was dropped again. At last we weighed on the 8th, and stood clear of a large ledge of rocks, which we had almost ran upon the preceding day. But in the forenoon we were once more obliged to anchor near a little island that was not laid down in any chart on board. It was found to be one of those called the Milles Isles. Mr. Banks and Dr. Solander having landed upon it, collected a few plants, and shot a bat which was a yard long, being measured from the extreme points of the wings; they also killed a few plovers on this island, the breadth of which does not exceed one hundred yards, and the length five hundred; they found a house and a little spot of cultivated ground, and on it grew the Palma Christi, from which the West Indians make their castor oil.

In a little time after the gentlemen returned to the ship, some Malays came along-side in a boat, bringing with them pumpions, dried fish, and turtle, for sale; one of the turtles, which weighed near one hundred and fifty pounds, they sold for a dollar, and seemed to expect the same piece of money for their fruit; but it being hinted to them that a dollar was too much, they desired that one might be cut, and a piece of it given to them, but this not being complied with, they at length sold twenty-six pumpions for a Portuguese pe-tacka. When they departed, they intimated their wishes, that this transaction might not be mentioned at Batavia.

We now made but little way till night, when the land-breeze springing up, we failed to the E. S. E. and on the following day, by the assistance of the sea-breeze, came to an anchor in the road of Batavia. At this place we found a number of large Dutch vessels, the Harcourt East-Indiaman from England, which had lost her passage to China, and two ships belonging to the private trade of our India company. The Endeavour had no sooner anchored, than a ship was observed, with a broad pendant flying, from which a boat was dispatched to demand the name of the vessel, with that of the commander, &c. To these enquiries Captain Cook gave such answers as he thought proper, and the officer who commanded the boat departed. This gentleman, and the crew that attended him, were so worn out with the unhealthiness of the climate, that it was apparent many deaths would follow: yet at present there was not one invalid on board of our ship, except the Indian Tupia. The Captain now dispatched an officer to the governor of the town, to apologize for the Endeavour's not saluting: for he had but three guns proper for the purpose, except swivels, and he was apprehensive that they would not be heard. The ship was so leaky, that she made about nine inches water in

an hour, on the average; part of the false keel was gone; one of her pumps was totally useless, and the rest so much decayed, that they could not last long. The officers and seamen concurring in opinion that the ship could not safely put to sea again in this condition, the Captain resolved to solicit permission to heave her down; but as he had learned that this must be done in writing, he drew up a petition, and had it translated into Dutch.

On Wednesday, October the 10th, the Captain and the rest of the gentlemen went on shore, and applied to the only English resident at Batavia; this gentleman, whose name was Leith, received his countrymen in the politest manner, and entertained them at dinner with great hospitality. Mr. Leith informed us, that a public hotel was kept in town, by order of the Dutch governor, at which place merchants and other strangers were obliged to lodge, and that the landlord of the hotel was bound to find them warehouses for their goods, on the condition of receiving ten shillings on every hundred pounds of their value, but as the Endeavour was a king's ship, her officers, and the other gentlemen, might reside where they thought proper, only asking leave of the governor, whose permission would be instantly obtained. Mr. Leith added, that they might live cheaper in this way than at the hotel, if they had any person who spoke the Batavian tongue, whom they could rely on to purchase their provisions, but as there was no such person among the whole ship's crew, the gentlemen immediately bespoke beds at the hotel. In the afternoon Captain Cook attended the governor-general, who received him politely, and told him to wait on the council the next morning, when his petition should be laid before them, and every thing that he solicited should be granted. Late in the evening of this day, there happened a most terrible storm of thunder and lightning, accompanied with very heavy rain. In this storm the main-mast of a Dutch East Indiaman was split and carried away by the deck; and the main-top-mast and main-top-gallant-mast were torn to pieces; it is supposed, that the lightning was attracted by an iron spindle at the main-top-gallant-mast-head. The Endeavour, which was at a small distance from the Dutch ship, escaped without damage, owing, most probably, to the electrical chain which conducted the lightning over the vessel.—A sentinel on board the Endeavour, who was charging his musket at the time of the storm, had it shaken out of his hand, and the ram-rod broken to pieces; the electrical chain looked like a stream of fire, and the ship sustained a very violent shock.

On Thursday the 11th, Capt. Cook waited on the gentlemen of the council, who informed him that all his requests should be complied with. In the interim the other gentlemen made a contract with the master of the hotel, to furnish them and their friends with as much tea, coffee, punch and tobacco, as they might have occasion for, and to keep them a separate table, for nine shillings a day English money: but on the condition that every person who should visit them, should pay at the rate of four shillings and six-pence for his dinner, and the same sum for his supper and bed, if he chose to sleep at the hotel; they were likewise to pay for every servant that attended them fifteen pence a day. It was soon discovered, that they had been much imposed on; for these charges were twice as much as could have been demanded at a private house. They appeared to live elegantly, but at the same time were but ill supplied. Their dinner consisted of fifteen dishes, all served up at once; and their supper of thirteen, but of these, nine or ten were of the most ordinary, because the cheapest, (poultry) that could be purchased, and even some of these dishes were observed to be served up four times successively: a duck, which was hot at dinner, was brought cold in the evening, the next day served up as a fricassée, and was converted into forced meat at night. We, however, only fared as others had done before us: it was the constant custom of the conscientious master of the hotel, to treat all his guests in the same manner: if we took no notice

of it, all was well, for the landlord had the better customers of us: if we remonstrated against such treatment, the table was better supplied from time to time, till, in the end we had no reason to complain. However, after a few days, Mr. Banks hired for himself and party, a small house, next door to the hotel, for which he paid forty-five shillings per month; but they were far from having the conveniences and privacy they expected: for no person was permitted to sleep in it as an occasional guest, under a penalty; and Dutchmen were continually running in without the least ceremony, to ask what was to be sold, it being a custom for most private persons in Batavia to be furnished with some articles of traffic. Every one here hires a carriage, and Mr. Banks engaged two. These carriages are open chaises; they hold two persons, and are driven by a man sitting on a kind of coach-box: for each of these Mr. Banks paid two rix-dollars a day.

Our Indian friend Tupia had hitherto continued on board on account of his disorder, which was of the bilious kind, yet he persisted in refusing every medicine that was offered him. Mr. Banks sent for him to his house, in hopes that he might recover his health. While in the ship, and even in the boat, he was exceedingly listless and low spirited, but he no sooner entered the town than he seemed as if reanimated. The houses, the carriages, streets, people, and a multiplicity of other objects, wholly new to him, produced an effect like the supposed power of fascination. But if Tupia was astonished at the scene, his boy Tayeto was perfectly enraptured. He expressed his wonder and delight with less restraint. He danced along the street in a kind of ecstasy, and examined every object with a restless curiosity which was each moment excited and gratified. Tupia remarked particularly the variety of dresses worn by the passing multitude, concerning which he made many enquiries. Being informed, that here were people of different nations, each of whom wore the habit of his respective country, he desired that he might conform to the custom, and appear in that of Otaheite; and some South-sea cloth being sent for from the ship, he dressed himself with great expedition and dexterity. The people of Batavia, who had seen an Indian brought thither in M. Bougainville's ship, named Otourou, mistook Tupia for that person, and frequently asked if he was not the same. About this time we had procured an order to the superintendent of the island of Ourust, where the ship was to be repaired, to receive her there, and by one of the ships that sailed for Holland, an account was sent to Mr. Stephens, secretary to the admiralty, of our arrival at this place. Here the captain found an unexpected difficulty in procuring money for the expenses that would be incurred by refitting the *Endeavour*; private persons had neither the ability nor inclination to advance the sum required; he therefore sent a written application to the governor himself, who ordered the Shebander to supply the captain with what money he might want out of the company's treasury.

Thursday the 18th, early in the morning, after a delay of some days, we ran down to Ourust, and laid the ship along-side of the wharf, on Cooper's Island, in order to take out her stores. After little more than nine days, we began to experience the fatal effects of the climate and situation. Tupia sunk on a sudden, and grew every day worse and worse. Tayeto, his boy, was seized with an inflammation on his lungs. Mr. Banks and Dr. Solander were attacked by fevers, and the two servants of the former became very ill; in short, almost every person both on board and ashore fell sick in a few days, owing, as we imagined, to the low swampy situation of the place, and the numberless dirty canals, that intersect the town in all directions.

On the 26th, when few of the crew were able to do duty, we erected a tent for their reception. Tupia, of whose life we began to despair, desired to be removed to the ship, in hopes of breathing a freer air; however this could not be done, as she was unrigged, and preparing to be laid down at the careening-place; but on the 28th, Mr. Banks conveyed him to Cooper's Island,

No. 10,

or as it is called here, Kuypor, and, as he seemed pleased with the spot near which the ship lay, a tent was pitched for him. When the sea and land breezes blew over him, he expressed great satisfaction at his situation. On the 30th Mr. Banks returned to town, having, from humanity alone, been two days with Tupia, whose fits of an intermitting fever, now became a regular tertian, and were so violent as to deprive him of his senses while they lasted, and left him so weak, that he could scarcely crawl from his bed. At the same time Dr. Solander's fever increased, and Mr. Monkhouse, the surgeon, was confined to his bed.

On Monday the 5th of November, after many unavoidable delays, the ship was laid down, and the same day Mr. Monkhouse, our surgeon, fell a sacrifice to this fatal country; whose loss was more severely felt, by his being a sensible, skilful man, and dying at a time when his abilities were most wanted. Dr. Solander was just able to attend his funeral, but Mr. Banks, in his turn, was confined to his bed. Great, inexpressibly great was our distress at this time; the prospect before us in the highest degree discouraging; our danger such as we could not surmount by any efforts of our own, for courage, diligence, and skill, were all equally ineffectual; and death was every day making advances towards us, when we could neither resist nor fly. The power of disease, from the pestiferous air of the country, daily gaining strength, several Malay servants were hired to attend the sick, but they had so little sense either of duty or humanity, that the patient was obliged frequently to get out of bed to seek them.

Friday the 9th, our Indian boy Tayeto paid the debt of nature, and poor Tupia was so affected at the loss, that it was doubted whether he would survive it till the next day. In the mean time the ship's bottom having been carefully examined, it was found to be in a worse condition than we apprehended. The false keel was considerably gone to within twenty feet of the stern post; the main keel was injured in many places; much of the sheathing was torn off; and several planks were greatly damaged: two of them, and half of a third, particularly, for the length of six feet, were so worn, that they were not above an eighth part of an inch thick, and the worms had made their way quite into the timbers: yet, in this condition, the *Endeavour* had sailed many hundred leagues, where navigation is as dangerous as in any part of the globe. How much misery did we escape, by being ignorant that so considerable a part of the bottom of the vessel was thinner than the sole of a shoe, and that every life on board depended on so slight a barrier between us and the unfathomable ocean!

Dr. Solander and Mr. Banks were now so worn down by their disorders, that the physician declared they had no chance for recovery but by removing into the country. In consequence of this advice a house was hired for them, at the distance of about two miles from the town, which belonged to the master of the hotel, who engaged to supply them with provisions, and the use of slaves. As they had already experienced the unfeeling inattention of these fellows to the sick, they bought each of them a Malay woman, who, from the tenderness of their sex made them good nurses. While these gentlemen were taking measures for the recovery of their health, we received an account of the death of our faithful Tupia, who sunk at once after the loss of his boy, Tayeto, whom he loved with the tenderness of a parent. When Tayeto was first seized with the fatal disorder, he seemed sensible of his approaching end, and frequently said to those that were about him Tyau mate see, "My friends I am dying;" he was very tractable, and took any medicines that were offered him: they were both buried in the island of Edam.

On the 14th, the bottom of the ship was thoroughly repaired, and much to Capt. Cook's satisfaction, who bestowed great encomiums on the officers and the workmen at the Marine-yard; in his opinion there is not one in the world, where a ship can be laid down with more convenient speed and safety, nor repaired with

more diligence and skill. At this place they heave down with two masts, a method we do not now practise; it is, however, unquestionably more safe and expeditious to heave down with two masts than one, and the man must want common sense, or be strangely attached to old customs, who will not allow this, after seeing with what facility the Dutch heave down and refit their largest vessels at Ourust. At this time Capt. Cook was taken ill. Mr. Sporing also, and a sailor who attended Mr. Banks, were seized with the deadly intermittents, and only ten of the ship's company were capable of doing duty. As to Mr. Banks and Dr. Solander, they recovered slowly at their country-house, which was open to the sea-breeze, and situated upon a running stream; circumstances that contributed not a little to a free circulation of air. Yet notwithstanding these perplexing obstacles, though harassed by a contagious disease, and alarmed by frequent deaths, we proceeded in rigging the ship, and getting water and necessary stores aboard: the stores were easily obtained and shipped, but the water we were obliged to procure from Batavia, at the rate of six shillings and eight-pence a leger, or one hundred and fifty gallons.

On the 25th, in the night there fell such a shower of rain, for the space of four hours, as even all of us had cause ever to remember. The water poured through every part of Mr. Banks's house, and the lower apartments admitted a stream sufficient to turn a mill. As this gentleman was now greatly restored in health, he went to Batavia the following day, and was surprized to see that the inhabitants had hung their bedding to dry. About the 26th of this month the westerly monsoon set in; it blows in the day-time from the N. or N. W. and from the S. W. during the night; previous to this, there had been violent showers of rain for several nights. The musquitos and gnats, whose company had been sufficiently disagreeable in dry weather, now begun to swarm in immense numbers, rising from the puddles of water like bees from a hive; they were extremely troublesome during the night, but the pain arising from the sting, though very severe, seldom lasted more than half an hour, and in the day-time they seldom made their attack. The frogs kept a perpetual croaking in the ditches, a certain sign that the wet season was commenced, and that daily rain might be expected.

The ship being repaired, the sick people received on board her, and the greater part of her water and stores taken in, she sailed from Ourust on the 8th of December, and anchored in the road of Batavia: twelve days were employed in receiving the remainder of her provisions, water, and other necessaries, though the business would have been done in much less time, but that some of the crew died, and the majority of the survivors were so ill, as to be unable to give their assistance.

On the 24th, Capt. Cook took leave of the governor, and some other gentlemen, who had distinguished themselves by the civilities they shewed him; but at this juncture an incident occurred, that might have produced consequences by no means desirable. A

sailor belonging to one of the Dutch ships in the road of Batavia, deserted from the vessel, and entered himself on board the Endeavour. The captain of the Dutch ship having made application to the governor, claiming the delinquent as a subject of the States General, the governor issued his order for the restoration of the man; when this order was delivered to him, he said, that the man should be given up, if he appeared to be a Dutchman. As the captain was at this time on shore, and did not intend going on board till the following day, he gave the Dutch officer a note to the lieutenant, who commanded on board the Endeavour, to deliver the deserter on the condition above-mentioned. On the following day the Dutchman waited on Capt. Cook, informing him, that the lieutenant had absolutely refused to give up the seaman, saying he was an Irishman, and of course a subject of his Britannic Majesty; Capt. Cook applauded the conduct of his officer, and added, that it could not be expected that he should deliver up an English subject. The Dutch officer then said, he was authorized, by the governor, to demand the fugitive as a Danish subject, adding that his name was entered in the ship's books as having been borne at Elsinore; to this Capt. Cook very properly replied, that the governor must have been mistaken, when he gave this order for delivering the deserter, who had his option whether he would serve the Dutch or the English; but in compliment to the governor, the man should be given up, as a favour, if he appeared to be a Dane, but that in this case, he should by no means be demanded as a right, and that he would certainly keep him, if he appeared to be a subject of the crown of Great Britain. The Dutchman now took his leave, and he had not been long gone before the captain received a letter from the commanding officer on board, containing full proof, that the man was an English subject. This letter the captain carried to the shebender, desiring him to lay it before the governor, and to inform him, that the man should not be delivered up on any terms whatever. This spirited conduct on the part of Capt. Cook, had the desired effect; and thus the matter ended.

This day the captain, attended by Mr. Banks and the other gentlemen who had hitherto lived in the town, repaired on board the ship, which got under sail the next morning. The Endeavour was saluted by the fort, and by the Elgin East Indiaman, which then lay in the road; but soon after these compliments were returned, the sea-breeze setting in, they were obliged to come to anchor. Since the arrival of the ship in Batavia Road every person belonging to her had been ill, except the sail-maker, who was more than seventy years old, yet this man got drunk every day while we remained there. The Endeavour buried seven of her people at Batavia viz. Tupia and his boy, three of the sailors, the servant of Mr. Green the astronomer and the surgeon; and at the time of the vessel's sailing, forty of the crew were sick, and the rest so enfeebled by their late illness, as to be scarcely able to do their duty.

C H A P. XII.

A descriptive account of the town of Batavia, and the circumjacent country—Its various productions particularized—The manners, customs, and way of living of the inhabitants fully described—The Endeavour sails from Batavia to the Cape of Good Hope—An account of the inhabitants of Prince's Island, with a comparative view of their language, with that of the Malay and Javanese—The arrival of the Endeavour at the Cape of Good Hope—Observations on the run from Java Head to that place—The Cape and St. Helena described—Remarks on the Hottentots—The Endeavour returns to England, and anchors in the Downs on Wednesday, June 12, 1771.

Batavia, situated in 6 deg. 10 min. S. latitude, and 106 deg. 50 min. E. longitude from the meridian of Greenwich, is built on the bank of a large bay, something more than twenty miles from the Streight of Sunda, on the north side of the island of Java, on a low boggy ground. Several small rivers, which rise forty miles up the country, in the mountains of Blauwen Berg, discharge themselves into the sea at this place,

having first intersected the town in different directions. There are wide canals of nearly stagnated water in almost every street, and as the banks of the canals are planted with trees, they appear at first very agreeable; but these trees and canals combine to render the air pestilential. Some of the rivers are navigable, more than thirty miles up the country; and, indeed, the Dutch appear to have chosen this spot to build the town on, for the sake

fake of water-carriage, in which convenience Batavia exceeds every place in the world, except the towns of Holland. A writer who published an account of this place near 50 years ago, makes the number of houses at that time 4760, viz. 1242 Dutch houses, and 1200 Chinese houses, within the walls; and 1066 Dutch houses, and 1240 Chinese houses, without the walls, with 12 houses for the vending of arrack. The streets of Batavia being wide, and the houses large, it stands on more ground than any place that has only an equal number of houses. In dry weather a most horrid stench arises from the canals, and taints the air to a great degree; and when the rains have so swelled their canals that they overflow their banks, the ground-floors of the houses, in the lower part of the town, are filled with stinking water, that leaves behind it dirt and slime in amazing quantities. The running streams are sometimes as offensive as the stagnant canals, for the bodies of dead animals are frequently lodged on the shallow parts, where they are left to putrify and corrupt the air, except a flood happens to carry them away; this was the case of a dead buffalo, while the crew of the Endeavour were there, which lay stinking on the shoal of a river, in one of the chief streets for several days. They sometimes clean the canals; but this business is performed in such a manner, as scarcely to make them less a nuisance than before, for the bottom being cleared of its black mud, it is left on the side of the canal till it is hard enough to be taken away in boats, and as there are no houses for necessary retirement in the whole town, the filth is thrown into the canals regularly once a day; so that this mud is a compound of every thing that can be imagined disagreeable and offensive.

The new church in Batavia, is a fine piece of building, and the dome of it may be seen far off at sea. This church is illuminated by chandeliers of the most superb workmanship, and has a fine organ: most of the other public buildings are ancient, constructed in an ill taste, and gave a very compleat idea of Dutch clumsiness. Their method of building their houses seems to have been taught them by the climate. On the ground-floor there is no room but a large hall, a corner of which is parted off for the transaction of business; the hall has two doors, which are commonly left open, and are opposite each other, so that the air passes freely through the room, in the middle of which there is a court, which at once increases the draft of air, and affords light to the hall; the stairs, which are at one corner, lead to large and lofty apartments above. The female slaves are not permitted to sit in any place but the alcove formed by the court, and this is the usual dining place of the family.

Batavia is encompassed by a river of shallow water, the stream of which is very rapid; within this river, which is of different widths in various places, is an old stone wall, much decayed in many places, and within the wall is a canal wider in some places than in others, so that there is no entering the gates of the town but by crossing two draw-bridges; there are but few on the ramparts, and no persons are permitted to walk there. There is a kind of citadel, or castle, in the N. E. corner of the town, the walls of which are both broader and higher than they are in other parts; it is furnished with a number of large guns, which command the landing-place.

Apartment is provided in this castle for the governor-general and all the council; and in case of a siege they have orders to retire thither. In the castle are likewise a number of store-houses, in which the effects belonging to the company are deposited. The company have in their possession large quantities of gun-powder, which is kept in different places, that the lightning may not destroy the whole stock at once; a great number of cannon are likewise laid up within the castle. There are a great many forts built in different parts of the country, several miles distant from Batavia, most probably erected to keep the natives in submission; and besides these there are a number of fortified houses, each mounting eight guns, which are so stationed as to command the canals and the roads on

the borders. There are houses of this kind in many parts of the island of Java, and the other islands in its neighbourhood, of which the Dutch have obtained possession. The Chinese having rebelled against them in the year 1740, all their principal houses were demolished by the cannon of one of these fortified houses, which is in the town of Batavia, where, likewise, there are a few more of them.

The roads of this country are only banks between the ditches and canals, and the fortified houses being erected among the morasses near these roads, nothing is easier than to destroy them, and consequently to prevent an enemy from bringing any heavy artillery near the town: if, indeed, an enemy be only hindered a short time in his approach, he is effectually ruined, for the climate will preclude the necessity of the use of weapons for his destruction. Before the Endeavour had been a week at Batavia, her crew began to feel the ill effects of the climate; half of them were rendered incapable of doing their duty before the expiration of a month. They were informed, that it was a very uncommon thing for 50 soldiers out of 100 brought from Europe, to be alive at the expiration of the first year, and that of the fifty who might happen to be living, not ten of those would be in sound health, and, probably, not less than half of them in the hospital.

In Batavia all the white inhabitants are soldiers, and, at the expiration of five years service, they are bound to hold themselves in readiness to go to war, if they should be wanted, and the younger inhabitants are frequently mustered; but as they are neither trained nor exercised after the expiration of the five years before-mentioned, the little they have learned is soon forgotten. The Indians, of whatever nation, who reside here, and have either been made free, or were born so, are called *Mardykens*; but neither these nor the Chinese are acquainted with fire-arms, yet as these people are said to possess great personal bravery, much might be expected from their expert use of their daggers, swords and lances. It would be a laborious task to attack Batavia by land, and it is not possible to make any attack at all by sea, for the shallowness of the water would hinder any vessels from advancing within cannon-shot of the walls; indeed there is barely depth of water for a ship's long-boat, except a narrow channel, called the river, which extends half a mile into the harbour, and is strongly bounded on each side with piers, the other end of it being directly under the fire of the castle, while its communication with the canals of the town is prevented by a boom of wood, which is every night shut precisely at six o'clock, and never opened till the following day.

In the harbour of Batavia, any number of ships may anchor, the ground is so excellent that the anchor will never quit its hold. This harbour is sometimes dangerous for boats, when the sea-breezes blow fresh; but, upon the whole, it is deemed the best and most commodious in all India. There is a considerable number of islands, which are situated round the outside of the harbour, and all these are in the possession of the Dutch, who destine them to different purposes. On one of them, which is called *Purmerent*, an hospital is erected, on account of the air being purer than it is at Batavia. In a second, the name of which is *Kuyper*, are erected numbers of warehouses, wherein are lodged the rice and some other commodities, which belong to the Dutch East-India Company; at this island those ships belonging to different nations, which are to be repaired at *Oorust*, unload their cargoes: and it was here that the stores of the Falmouth man of war were laid up, when she was condemned on her return from *Manilla*; her warrant officers, of whom mention has been made in the account of Captain Wallis's voyage, were sent to Europe in Dutch ships about half a year before the Endeavour anchored in the road of Batavia. A third of these islands, the name of which is *Edam*, is appropriated to the reception of certain offenders, whose crimes are not deemed worthy of death, and thither they are transported from Holland, and detained from five to forty years, in proportion to the heinousness.

ness of the offence they have committed: making of ropes is the principal part of the employment of these criminals.

The environs of Batavia have a very pleasing appearance, and would in almost any other country, be an enviable situation. Gardens and houses occupy the country for several miles, but the former are so covered with trees, that the advantage of the land having been cleared of the wood that originally covered it, is almost wholly lost; while these gardens and the fields adjacent to them are surrounded by ditches which yield a disagreeable smell; and the bogs and morasses in the adjacent fields are still more offensive. For the space of more than thirty miles beyond the town, the land is totally flat, except in two places, on one of which the governor's country-seat is built, and on the other they hold a large market; but neither of these places is higher than ten yards from the level of the plain. At near forty miles from the town the land rises into hills, and the air is purified in a great degree; to this distance the invalids are sent by their physicians when every other prospect of their recovery has failed, and the experiment succeeds in almost every instance, for the sick are restored to health; but they no sooner return to the town, than their former disorders revisit them. On these hills the most opulent of the inhabitants have country seats, to which they pay an annual visit. Those who reside constantly on the hills, enjoy an almost perpetual flow of health; and most of the vegetables of Europe grow as freely there as in their native ground: the strawberry in particular flourishes greatly, which is a sufficient proof of the coolness of the air.

In this country rice is very plentiful, and, in order to be brought to perfection, should lie under water more than half the time it is growing: but they have a sort which grows on the sides of the hills, which is unknown in the West-India islands; this sort is planted when the wet season commences, and the crop is gathered in, soon after the rains are over. The maize, which grows near Batavia, is gathered while young, and roasted in the ear. The land likewise produces carrots, celery, parsley, asparagus, onions, radishes, cabbages, lettuces, cucumbers, lentiles, kidney-beans, hyssop, sage, rue, Chinese white radishes, which when boiled, are not unlike a parsnip, common potatoes, sweet potatoes, wet and dry yams, millet, and the egg plant, the fruit of which, when broiled and eaten with salt and pepper, is most exquisite food. Amazing crops of sugar are produced here, and, while the quantity is beyond comparison greater, the care of cultivation is inconceivably less than in the West-India islands. White sugar is retailed at two-pence half-penny the pound; and arrack is made of the molasses, with a small addition of rice, and the wine of the cocoa-nut. The inhabitants likewise raise a little indigo for their own use, but do not export it.

The fruits of this country are near forty in number, and of some of these there are of several kinds. Pine-apples grow in such abundance, that they may be purchased at the first hand, for the value of an English farthing; and we bought some very large ones for a half-penny a piece at the fruit-shops, and their taste is very excellent. They grow so luxuriantly, that seven or eight suckers have been seen adhering to one stem. The sweet oranges of Batavia are good of their kind, but very dear at particular times. The shaddocks of the West-Indies, called here Pamplemooses, have an agreeable flavour. Lemons were very scarce when the Endeavour lay in the harbour, but limes were altogether as plentiful, and sold at little more than two-pence the score. There are many kinds of oranges and lemons, but none of them excellent. Of mangoes there are plenty, but their taste is far inferior to the melting peach of England, to which they have been compared. It is said that the heat, and extreme dampness of the climate does not agree with them, yet there are many different kinds of them. Of bananas, there are an amazing variety of sorts, some of which being boiled, are eaten as bread, while others are fried in batter, and are a nourishing food: but of the numerous sorts of fruit, three only are fit to be eaten: one indeed is re-

markable, because it is filled with seeds, which are not common to the rest. Grapes are sold from one shilling to eighteen pence a pound, though they are far from being good. The tamarinds are cheap and plentiful; but as the method of preserving them, which is in salt, renders them a mere black lump, they are equally nauseating to the sight and to the palate. The water melons are excellent of their kind, and are produced in great abundance. The pumpions are boiled as turnips, and eaten with salt and pepper. This fruit is admirably adapted to the use of voyagers, as it will keep many months without care, and makes an excellent pye, when mixed with the juice of lemons and sugar. The papans of this country are superior to turnips, if the cores are extracted, after paring them when they are green. The guava has a strong smell, and a taste not less disagreeable: it is probable, that the guava of the West-Indies, which many writers have distinguished by their praises, has a very different flavour. The sweet sop is a fruit that has but little flavour: it abounds in large kernels, from which the pulp is sucked. The taste of the custard-apple very much resembles the dish from which its name is taken. The casheu apple produces a nut which is not unknown in England, but the fruit has such an astringent quality, that the Batavians seldom eat of it: the nut grows on the top of the apple. The cocoa-nut is plentiful in this country, and there are several kinds of this fruit, the best of which is very red between the shell and the skin. The jamboo is a fruit that has but little taste, but is of a cooling nature: it is considerably less than a common-sized apple, and those that have grown to their full size, are always the best; its shape is oval, and its colour a deep red. Of the Jambu-eyer, there are two kinds, the white and the red: they are shaped like a bell, and are something bigger than a cherry: they have no kind of taste but that of a watery acid. The Jambu-eyer mauwar, smells like a rose, and its taste is not unlike that of conserve of roses. The mangostan is of a dark red colour, and not larger than a small apple: to the bottom of this fruit adhere several little leaves of the blossoms, while on its tops are a number of triangles combined in a circle, it contains several kernels ranged in a circular form, within which is the pulp, a fruit of most exquisite taste; it is equally nutritious and agreeable, and is constantly given to persons who are troubled with inflammatory or putrid fevers. The sweet orange of this country is likewise given in the same disorders. The pomegranate of these parts differs in nothing from that generally known in England. The durion takes its name from the word Dure, which, in the language of that country, means prickles, and the name is well adapted to the fruit, the shell of which is covered with sharp points, shaped like a sugar-loaf: its contents are nuts not much smaller than chestnuts, which are surrounded with a kind of juice resembling cream; and of this the inhabitants eat with great avidity: the smell of this fruit is more like that of onions, than any other European vegetable, and its taste is like that of onions, sugar, and cream intermixed: the inside of the durion, when ripe, is parted, lengthways, into several divisions. The nanca is a fruit that smells like garlick and apples mixed together: its size in the gardens of Batavia, is not bigger than that of a middling sized pompion, and its shape is nearly the same: it is covered with prickles of an angular form. We were informed that, at a place called Madura, it has been known to grow to such an enormous size as to require the strength of two men to carry it. The champada is in all respects like the nanca, only that it is not so large. The rambutan contains a fruit within which is a stone, that is perhaps the finest acid in the world: this fruit is not unlike a chestnut with its husk on; and it is covered with small prickles of a dark red colour, and so soft as to yield to the slightest impression. The gambolan resembles a damascen both in colour and size, and is of a very astringent nature. The boa bidarra tastes like an apple, and is likewise extremely astringent: its size is that of a gooseberry, its form round, and its colour yellow. The nam nam makes an excellent fritter, if

fried in batter, but is not esteemed when raw: the rind of it is rough, its length is about three inches, and its shape not unlike that of a kidney. The catappa and the canare are two species of nuts, the kernels of which are like those of an almond, but so hard, that it is almost impossible to break them. The madja contains a pulp of a sharp taste, which is eaten with sugar: this fruit is covered with a hard shell. The funtal is a fruit scarcely fit to be eaten, being at once astringent, acid, and of a most unpleasant taste, yet it is publicly sold in the streets of Batavia: it contains a number of kernels, which are inclosed in a thick skin. The salack is nearly of the size of a small golden pippin, and contains a few kernels of a yellow colour, the taste of which is not unlike that of a strawberry; but the covering of this fruit is very remarkable, as it consists of a number of scales, resembling those of a fish. The chefrema and the blimbing, are two four fruits, exceedingly well adapted to make sour sauce, and pickles. The blimbing besse is another fruit of the same kind, but considerably sweeter.

Of the fruits not in season when Captain Cook was at Batavia, are the boeatap, and the kinship, which he saw preserved in sugar: and there are several other sorts which the Batavians are fond of, but they are never eaten by strangers: among those are the moringa, the guilindina, the killer, and the foccum; this last has the appearance of the bread-fruit which is produced in the islands of the South Seas, but it is not near so good, though the tree on which it grows is almost exactly like the bread-fruit tree. At Batavia vast quantities of fruit are eaten. There are two markets held weekly, at distant places for the better accommodation of those who reside in different parts of the country. Here the fruit-sellers meet the gardeners, and purchase the goods at low rates. We are told it is not uncommon to see fifty or sixty loads of pine-apples carelessly thrown together at those markets. Flowers are strewn by the inhabitants of Batavia and Java, about their houses, and they are constantly burning aromatic woods and gums, which is supposed to be done by way of purifying the air from the stench that arises from the canals and ditches about the town.

In this country sweet-scented flowers are plentiful, many species of which being entirely unknown, are worth remarking. The combang tonquin, and combang carenassi, are particularly fragrant flowers, which bear scarcely any resemblance to any of those flowers with which we are acquainted. They are very small, and seem to be of the dog's-bane species. The camunga which is more like a bunch of leaves than a flower, is of a singular smell, but very grateful. The bon tanjong is of a pale yellow cast, and has a very agreeable smell; it is about an inch and a half in circumference, and consists of pointed leaves, which give it the appearance of a star. The champacka smells somewhat like a jonquil, but is rather of a deeper yellow. A large tree upon the island produces this flower. There is also an extraordinary kind of flower called fundal malam, which signifies the intriguer of the night. This flower has no smell in the day-time, but as night comes on, it has a very fragrant scent, and is very much like the English tuberose. These flowers being made into nosegays of different shapes, or strung upon thread, are carried through the street for sale on an evening. The gardens of the gentlemen produce several other sorts of flowers besides these which we have mentioned, but they are not offered to sale, because there is not a sufficient plenty of them. A plant, called the pandang, is produced here, the leaves of which being shred small, and mixed with other flowers, the natives of both sexes fill their cloaths and hair with this mixture, which they likewise sprinkle on their beds, and sleep under this heap of sweets, a thin piece of chintz being their only covering.

Formerly the only spice that grew on the island of Java was pepper. A considerable quantity is brought from thence by the Dutch, but very little of it is made use of in the country. The inhabitants prefer cayen pepper, and are fond of cloves and nutmeg, but these

No. 10.

first are too dear to be commonly used. Near the island of Amboyna are some little isles, on which the cloves grow, and the Dutch were not easy till they all became their property. Scarcely any other nutmegs are found but on the island of Banda, which however furnishes enough for all the nations that have a demand for that commodity. There are but few nutmeg-trees on the coast of New Guinea. The island of Java, of which we have already spoken, produces horses, buffaloes, sheep, goats, and hogs. The sort of horses said to have been met with here when the country was first discovered, appeared to be nimble animals though small, being generally seldom above thirteen hands high. The horned cattle of this country are different from those of Europe. They are quite lean, but of a very fine grain. The Chinese and the natives of Java eat the buffaloes flesh, which the Dutch constantly refuse, being impressed with a strange idea that it is feverish. The sheep are hairy like goats, and have long ears: they are mostly found to be tough and ill-tasted. There happening to be a few from the Cape of Good Hope at Batavia, some of them were purchased at the rate of one shilling a pound. The hogs, especially those of the Chinese stock, are very fine food, but so fat as that the lean is separately sold the butchers, who are Chinese; the fat, they melt and sell to their countrymen to be eaten with their rice. Yet though these hogs are so fine, the Dutch prefer their own breed, and the consequence is that these latter are sold at extravagant rates.

As the Portuguese shoot the wild hogs and deer, they are sold at a moderate price, and are good eating. As to the goats of this country they are as indifferent as the sheep. Dogs and cats are found here in abundance, and there are numbers of wild horses at a considerable distance from Batavia, on the mountains. There are a few monkeys seen near the town; but there are many on the mountains and desert-places, where there are also tigers, and a few rhinoceroses.

Of fish an astonishing quantity is taken here, and all are fine food, except a few that are scarce; yet the inhabitants will not eat those that are found in abundance, but purchase those which are worse and scarcer, a circumstance that contributes to keep up the price of the latter. A prejudice likewise prevails among the Dutch which prevents them from eating any of the turtle caught in these parts, which are very good food, though not equal to those that are found in the West-Indies. Very large lizards are common at Batavia; some of them are said to be as thick as a man's thigh; and Mr. Banks shot one five feet long, which being dressed, proved very agreeable to the taste. We found snipes of two different sorts; and thrushes might have been purchased of the Portuguese, who were the only dealers in this sort of birds, and venders of wild fowl in the country. In the island are palm-wine, and arrack. Of the former are three sorts, the first of which is drank in a few hours after it is drawn from the tree, and is moderately sweet; the second and third sorts are made by fermentation, and by putting several sorts of herbs and roots into the liquor.

In Java, the religion of Mahomet is professed, for which reason the natives do not make use of wine publicly; but in private few of them will refuse it. They also chew opium, whose intoxicating qualities prove its recommendation to the natives of India.

If we exclude the Chinese, and the Indians of different nations, who inhabit Batavia and its environs, the inhabitants only amount to a small number, not a fifth part of whom are said to be Dutchmen, even by descent. The Portuguese out-number all the European settlers on the island. The troops in the service of the states of Holland, are composed of the natives of almost all the nations of Europe; but the greater part of them are Germans. When any person goes to reside at Batavia, he is obliged to enter first as a soldier, to serve their company for five years. Afterwards he applies for a leave of absence to the council, which being granted as a thing of course, he engages in any business that he thinks proper to chuse. There is however a sort of policy in this matter, since the Dutch have this

Y

always

always a force ready to arm and join their troops in this country upon any emergency; all places of power and profit are held by the Dutch, and no foreigner has any share in the management of public affairs.

Notwithstanding all the men of other countries are bound to observe the rules above-mentioned, yet women from all parts may remain here unmolested. It appeared that the whole place could not furnish fifty females who were natives of Europe; yet the town abounded with white women, who were descended from Europeans, that had settled there at different times, all the men having paid the debt of nature; for so it is, that the climate of Batavia destroys the men much faster than the women. These women follow the delicate custom of chewing betle, after the example of the native Javanese, whose dress they imitate, and whose manners they copy, in all respects. Mercantile business is conducted at Batavia with the slightest trouble imaginable. When a merchant receives an order for goods of any kind, he communicates the contents of it to the Chinese, who are the universal manufacturers. The Chinese agent delivers the effects on board the ship for which they are bespoke, and taking a receipt for them from the master of the vessel, he delivers it to the merchant, who pays the Chinese for the goods, and reserves a considerable profit, without the least trouble, risque, or anxiety. But when a merchant imports goods of any kind, he receives them himself, and lodges them in his own warehouses. It may be wondered that the Chinese do not ship the goods on their account, but from this they are restricted, and compelled to sell them to the merchants only. The inhabitants of Java distinguish the Portuguese by the name of Oranferanc, that is, Nazarene-men; but these use the general term of Capor, or Casir, respecting all who do not profess the religion of Mahomet, and in this they include the Portuguese. But the Portuguese of Batavia are so only in name; for they have neither any connection with, or knowledge of the kingdom of Portugal, and they have changed the religion of the church of Rome, for that of Luther; with the manners of the natives, they are wholly familiarised, and they commonly speak their language, though they are able to converse in a corrupt kind of Portuguese. They dress in the habit of the country, with a difference only in the manner of wearing their hair; their noses are more peaked and their skin of a deeper cast than that of the natives. Some of them are mechanics and artificers, others subsist by washing of linen, and the rest procure a maintenance by hunting.

The Indians of Batavia, and the country in its neighbourhood, are not native Javanese, but are either born on the several islands from whence the Dutch bring their slaves, or the offspring of such as have been born on those islands; and these having been made free either in their own persons or in the persons of their ancestors, enjoy all the privileges of freemen. They receive the general appellation of believers of the true faith. The various other Indian inhabitants of this country attach themselves each to the original customs of that in which themselves or their ancestors were born; keeping themselves apart from those of other nations, and practising both the virtues and vices peculiar to their own countries. The cultivation of gardens, and the consequent sale of flowers and fruit afford subsistence to great numbers of them: these are the people who raise the betle and areca, which being mixed with lime, and a substance that is called Gambir, the produce of the Indian continent, is chewed by persons of all ranks, women as well as men: indeed some of the politer ladies make an addition of cardamom, and other aromatics, to take off the disagreeable smell with which the breath would be otherwise tainted. Some of the Indians are very rich, keep a great number of slaves, and live, in all respects, according to the custom of their respective countries, while others are employed to carry goods by water; and others again subsist by fishing. The Oranflams, or believers of the faith, feed principally on boiled rice, mixed with a small quantity of dried shrimps and other fish, which are imported from China,

and a little of the flesh of buffaloes and chickens; they are fond of fruit, of which they eat large quantities, and with the flour of the rice they make several sorts of pastry. They sometimes make very superb entertainments, after the fashion of their respective countries; but, in general, they are a very temperate people; of wine they drink very little, if any, as the religion of Mahomet, which they profess, forbids the use of it. When a marriage is to be solemnized among them, all the gold and silver ornaments that can be procured, are borrowed to deck out the young couple, who, on these occasions, never fail to make the most splendid appearance; sumptuous entertainments are given by those who can afford them, which continue twelve or fourteen days, and frequently more, during all which time the women take care that the bridegroom shall not visit his wife privately, though the wedding takes place previous to the festival. All these Indians, though they come from different countries, speak the Malay language if it deserves that name. On the island of Java there are two or three different dialects, and there is a language peculiar to every small island; it is conjectured that the Malay tongue is a corruption of the language of Malacca. The hair of these people, which is black without a single exception, grows in great abundance; yet the women make use of oils, and other ingredients, to increase the quantity of it: they fasten it to the crown of the head with a bodkin, having first twisted it into a circle, round which they place an elegant wreath of flowers, so that the whole head-dress has a most beautiful appearance. It is the universal custom both with the men and women, to bathe in a river once every day, and sometimes oftener, which not only promotes health, but prevents that contraction of filth, that would be otherwise unavoidable in so hot a climate. The teeth of the Oranflams have some particulars in them well worthy of notice. With a kind of whetstone they rub the ends of them till they are quite flat and even; they then make a deep groove in the teeth of the upper jaw, in the centre between the bottom of each tooth and the gum, and horizontally with the latter; this groove is equal in depth to a quarter of the thickness of the teeth; yet none of these people have a rotten tooth, though according to the dentists of England and France, such a thing must be unavoidable, as the tooth is placed much deeper than what we call the enamel. The teeth of these people became very black by the chewing of betle, yet a slight washing will take off this blackness, and they will then become perfectly white; but they are very seldom washed as the depth of the colour is very far from being thought disagreeable. Most of our readers must have heard of the Mohawks; and these are the people who are so denominated, from a corruption of the word amock, which will be explained by the following story and observations. To run amock is to get drunk with opium, and then seizing some offensive weapon, to sally forth from the house, kill the person or persons supposed to have injured the Amock, and any other person that attempts to impede his passage, till he himself is taken prisoner or killed on the spot. While Captain Cook was at Batavia, a person, whose circumstances in life were independent, being jealous of his brother, intoxicated himself with opium, and then murdered his brother, and two other men who endeavoured to seize him. This man, contrary to the usual custom, did not leave his own house, but made his resistance from within it; yet he had taken such a quantity of the opium, that he was delirious, which appeared from his attempting to fire three muskets, neither of which had been loaded, nor even primed. Jealousy of the women is the usual reason of these poor creatures running amock [or a-muck] and the first object of their vengeance is the persons whom they suppose to have injured them. The officer, whose business it is to apprehend these unhappy wretches, is furnished with a long pair of tongs, in order to take hold of them without coming within the reach of the point of their weapon. Those who may be taken alive, which is not often the case, are generally wounded; but they are always broken upon the wheel; and if the

physician, who is appointed to examine their wounds, thinks them likely to be mortal, the punishment is inflicted immediately, and the place of execution is generally the spot where the first murder was committed. A number of absurd customs prevailed among these people, and opinions no less ridiculous. They believe that the devil, whom they call Satan, is the author of sickness and adversity; therefore, when sick, or in distress, they offer meat, money, and other things, as propitiatory sacrifices. Should one among them be restless, or should he dream for two or three nights successively, he imagines the Devil has laid his commands upon him, when, upon neglect to fulfil, he concludes his punishment will certainly be sickness or death, though such commands may not be revealed with sufficient perspicuity. To interpret his dream therefore, he strains his wits to the uttermost, and if, by taking it literally, or figuratively directly, or by contraries, he can put no explanation that satisfies him, he applies to the Cavin or priest, who unravels the mysterious suggestions of the night, by a comment, in which it generally appears, that Satan wants victuals or money. These are placed on a little plate of cocoa-nut leaves, and hung upon the branch of a tree near the river, so that it seems not to be the opinion of these people, that in prowling the earth the devil "walketh through dry places." Mr. Banks once asked, whether they thought Satan spent the money, or eat the victuals; they said, that as to the money it was considered rather as a mulct upon an offender, than a gift to him who had enjoined it; and that therefore if it was devoted by the dreamer, it did not signify into whose hands it came, and they supposed it was generally the prize of some stranger who wandered that way; but respecting the meat, they were clearly of opinion, that, although the Devil did not eat the gross parts, yet by bringing his mouth near it, he sucked out all its savour without changing its position, so that afterwards it was as insipid as water.

Another superstitious notion of this people is still more unaccountable. They imagine that women, when delivered of children, are at the same time delivered of a young crocodile; and that those animals being received carefully by the midwives, are immediately carried down to the river, and put into the water. The family in which such a birth is supposed to have happened, constantly puts victuals into the river for their amphibious relation, especially the twin, who as long as he lives, goes down to the river at stated times, to fulfil his fraternal duty; for an omission of which, according to the general opinion, he will be visited with sickness or death. We are at a loss to account for an opinion so extravagant and absurd, especially as it seems to be unconnected with any religious mystery, and how it should be pretended to happen by those who cannot be deceived into a belief of it by appearances, nor have any apparent interest in the fraud, is a problem still more difficult to solve. The strange belief of this absurdity, however, is certain, for which we had the concurrent testimony of every Indian who was questioned about it; and as to its origin, it seems to have taken its rise in the islands of Celebes and Boutou, at which places, many of the inhabitants keep crocodiles in their families; but however that be, this opinion has spread over all the eastern islands, even to Timor and Cream, and westward as far as Java and Sumatra. The crocodile twins are called Sudaras, and we shall here relate one of the innumerable and incredible stories, in proof of their existence, as was confidently affirmed, from ocular demonstrations; yet for the credibility of this relation we will not vouch.

At Bencoolen was born and bred among the English a young female slave, who had learnt a little of the language. This girl told Mr. Banks that her father, when on his death bed, informed her that he had a crocodile for his Sudara, and in a solemn manner charged her to give him meat when he should be dead, telling her in what part of the river he was to be found, and by what name he was to be called up. That in consequence of her father's injunctions, she repaired to that part of the river he had described, and standing upon

the bank, called out Radja Pouti, "white king;" whereupon the crocodile came to her out of the water, and eat from her hand the provisions she had brought him. Being desired to describe this paternal uncle, she said, that he was not like other crocodiles, but much handsomer; that his body was spotted and his nose red; that he had bracelets of gold upon his feet, and earrings of the same metal in his ears. This ridiculous tale was heard by Mr. Banks patiently to the end, and he then dismissed the girl, without reminding her, that a crocodile with ears was as strange a monster as a dog with a cloven foot. Not long after this a servant whom Mr. Banks had hired at Batavia, a son of a Dutchman by a Javanese woman, told his master, that he had seen a crocodile of the same kind, and it had been seen by several others both Dutchmen and Malays. This crocodile the servant said was very young, two feet long, and its feet were ornamented with bracelets of gold. I cannot credit these idle stories, said Mr. Banks. The other day a person asserted that crocodiles had earrings, and you know that cannot be true, because crocodiles have not ears. Ah, Sir, replied the man, these Sudara Oran are unlike other crocodiles; for they have five toes upon each foot, a large tongue that fills their mouth, and ears likewise, though indeed they are very small. Who can set bounds to the ignorance of credulity and folly! However, in the girl's relation were some things in which she could not be deceived; and therefore must be guilty of wilful falsehood. Her father might command her to feed a crocodile, in consequence of his believing it to be his Sudara; but its coming out of the river at her call, and eating the food from her hand, must have been a fable of her own invention, and being such, it was impossible that she could believe it to be true. However, the girl's story, and that of the man's, evinces, that they both believed the existence of crocodiles that were Sundaras to men; and the fiction invented by the girl may be easily accounted for, if we do but consider, how earnestly every one desires to make others believe what he believes himself. The Bougis, Macassars, and Boetons, are so firmly persuaded that they have relations of the crocodile species, that they perform a periodical ceremony in remembrance of them. Large parties go out in a boat, furnished with great plenty of provisions, and all kinds of music. They then row backwards and forwards, in places of the river where crocodiles and alligators are most common, singing and weeping by turns, each invoking his kindred, till a crocodile appears, when the music instantly stops, and provisions, betle, and tobacco, are thrown into the water. This civility is intended to recommend themselves to their relations at home; not without hopes, perhaps, that it will be accepted instead of more expensive offerings which may not be in their power to pay.

The Chinese stand in the next rank to the Indians, and are very numerous, but possess very little property. Many of them live within the walls, and are shopkeepers. We have already mentioned the fruit-sellers of Passar Pissang; but others have a rich stock of European and Chinese goods. However, the far greater part of these people live without the walls, in a quarter by themselves, which is called Campang China. Most part of them are carpenters, joiners, smiths, taylor, slipper-makers, dyers of cotton, and embroiderers. They maintain the character of industry, universally bestowed upon them; and many are scattered about the country, where they cultivate gardens, sow rice and sugar, or keep cattle and buffaloes, whose milk they bring every day to town. Yet notwithstanding their commendable spirit of industry, we must observe, there is nothing honest or dishonest, provided there is no danger of a halter, that the Chinese will not readily do for money; and though they work with much diligence, nor are sparing of their labour, yet no sooner have they laid down their tools, than they begin to game either at cards or dice, or at other diversions altogether unknown among Europeans. To these they apply with such eagerness, as scarcely to allow time for necessary refreshments of food and sleep. In manners they are always

ways rather obsequious; and in dress they are remarkably neat and clean, in whatever rank of life they are placed. A description of their persons or dress is unnecessary, seeing the better kind of China paper common in England, exhibits an exact representation of both, though perhaps with some slight exaggerations. With respect to their eating, they are easily satisfied; but the few that are rich have many savory dishes. The food of the poor is rice, with a small proportion of flesh or fish; and they have the advantage of the Mahomedan Indians, on account of their religion; for the Chinese, being under no restraint, eat, besides pork, dogs, cats, frogs, lizards, serpents, and a great variety of sea animals, which the other inhabitants do not consider as food. They also eat many vegetables, which an European, except he was perishing with hunger, would not taste. They have a singular custom respecting the burying their dead; for they cannot be prevailed upon to open the ground a second time, where the body has been deposited. On this account, in the neighbourhood of Batavia, their burying-grounds contain many hundred acres; and the Dutch, pretending this to be a waste of land, will not sell any for this purpose, unless at an exorbitant price. The Chinese, however, contrive to raise the purchase money, and afford another instance of the folly and weakness of human nature, in transferring a regard for the living to the dead, and making that an object of solicitude and expence, which cannot receive the least benefit from either. Under the influence of this universal prejudice, they take an uncommon method to preserve the body entire, and to prevent the remains of it from mixing with the earth that surrounds it. To this end they enclose it in a large thick wooden coffin, hollowed out of solid timber like a canoe. This when covered and let down into the grave, is surrounded with a coat of mortar, called Chinam, about eight or ten inches thick, which in a short time cements, and becomes as hard as stone. The relatives of the deceased attend the funeral ceremony, with a considerable number of female mourners, hired to weep. In Batavia, the law requires, that every man should be interred according to his rank, which is in no case to be dispensed with; so that if the deceased has not left sufficient to pay his debts, an officer takes an inventory of what was in his possession when he died, and out of the produce buries him in the manner prescribed, leaving only the overplus to his creditors.

The lowest class of people in this country are the slaves, by whom the Dutch, Portuguese, and Indians, whatever their rank or situation, are constantly attended. They are bought in Sumatra, Malacca, and almost all the Eastern Islands: but the natives of Java, very few of whom live in Batavia, are exempted from slavery, under the sanction of very severe penal laws, seldom we believe violated. These slaves are sold from ten to twenty pounds sterling each; but girls, if handsome, will fetch sometimes a hundred. Being of an indolent disposition, they will not do much work, and are therefore content with a little victuals, subsisting altogether upon boiled rice, and a small quantity of the cheapest fish. They are natives of different countries, on which account they differ from each other extremely both in person and temper. The Papua, as they are here called, or the African negroes are the worst, most of them thieves and all incorrigible; consequently they may be purchased for the least money. The next class to these are the Bougis and Macassars, both from the island of Celebes; who, in the highest degree are lazy, though not so much addicted to theft as the negroes; yet they are of a cruel and vindictive spirit, whereby they are rendered exceeding dangerous, especially as to gratify their resentment, they make no scruple of any means, nor of sacrificing life itself. Besides these there are Malays and slaves of other denominations: but the best, and of course the dearest, are those brought from the island of Bali; and the most beautiful women from Nias, a small island on the coast of Sumatra; but being of a tender and delicate constitution, they quickly fall a sacrifice to the unwholesome air of Batavia. All these slaves are wholly in the power of their masters, who may

inflict upon them any punishment that does not take away life; and should one die in consequence of punishment, though his death may be proved not to have been intended, yet the master is called to a severe account, and generally sentenced to suffer capitally. For this reason a master seldom corrects a slave with his own hands, but by an officer called a *Marineu*, one of whom is stationed in every district. The duty of this officer is to quell riots, and take offenders into custody; but more particularly to apprehend runaway slaves, and punish them for such crimes as the master has supported by proper evidence; the punishment, however, is not inflicted by the *Marineu* in person, but by slaves who are appointed to the business. The punishment is stripes, the number being proportioned to the nature of the offence; and the instruments are rods made of rattans, which are split into tender twigs for the purpose, and every stroke draws blood. A common punishment costs the master a rixdollar, and a severe one a ducatoon, about six shillings and eight-pence. The master is also obliged to allow a slave, as an encouragement, three *dubbelscheys*, equal to about seven-pence half-penny a week; this is also done to prevent his indulging his strong temptations to steal.

Respecting the government of this place we can say but little. We observed a remarkable subordination among the people. Every house-keeper has a certain specific rank, according to the length of time he has served the company. The different ranks thus acquired are distinguished by the ornaments of the coaches, and the dresses of the coachmen: some ride in plain coaches, some are allowed to paint them with different devices, and some to gild them. The coachmen also are obliged to appear in clothes quite plain, or ornamented in various manners and degrees.

The chief officer in this place has the title of governor-general of the Indies, to whom the Dutch governors of all other settlements are subordinate; and they are obliged to repair to Batavia in order to have their accounts passed by him. Should they appear to have been criminal, or even negligent, he detains them during pleasure; sometimes three years; for they cannot without his permission quit the place. The members of the council, called by the natives *Edele Heeren*, and by the English, *Idoleers*, are next in rank to the governor-general. These assume so much state, that whoever meets them in a carriage, are expected to rise up and bow, and after this compliment, they drive to one side of the road and stop, till the members of the council are past: their wives and children expect also the same homage, and it is commonly paid them by the inhabitants. Some English Captains have thought this a slavish mark of respect, derogatory to their dignity as servants of his Britannic majesty, and for this reason have refused to pay it; nevertheless, when in a hired coach, nothing but a menace of immediate death could prevent the coachman from honouring the Dutch grandee, at the expence of their mortification.

With respect to the distribution of justice, it is administered in Batavia by the lawyers, who have peculiar ranks of distinction among themselves. Their decisions in criminal cases seem to be severe with respect to the natives, but lenient in a partial degree to their own people. A Christian is always indulged with an opportunity of escaping before he is brought to trial, whatever may be his offence, and when convicted, he is seldom punished with death. On the contrary, the poor Indians are hanged, broken upon the wheel, and even impaled alive. As to the Malays and Chinese they have judicial officers of their own, named captains and lieutenants, who determine in civil cases, subject to an appeal to the Dutch tribunal. The taxes laid upon these people by the company are very considerable, among which, that exacted for liberty to wear their hair is not the least. The time of payment is monthly, and to save the charge and trouble of collecting them, notice is given of this by hoisting a flag upon the top of a house in the middle of the town, and the Chinese find that it is their interest to repair thither when a payment is due without delay.

At Batavia the current money consists of ducats, valued at one hundred and thirty-two stivers; ducatoons eighty stivers: imperial rix-dollars, sixty; rupees, thirty; schellings, six; double cheys, two stivers and a half; and doits one fourth of a stiver. During our stay here Spanish dollars were at five and five-pence; and we were told they were never lower than five shillings and four-pence, even at the Company's warehouse. For English guineas the exchange upon an average was nineteen shillings; for though the Chinese would give twenty shillings for some of the brightest, those that were much worn were valued at only seventeen shillings. There are two sorts of coin current here of the same denomination; these are milled and unmilled; the former of which is of most value. A milled ducatoon is valued at eighty stivers; and an unmilled one at no more than seventy-two. A rix-dollar is equal to forty-eight stivers, about four shillings and six-pence English currency. All accounts are kept in rix dollars and stivers, which here, at least, are nominal, like our pound sterling.

On Thursday, the 27th of December, early in the morning, we weighed, left the harbour of Batavia, and stood out to sea. On the 29th, after much delay by contrary winds, we weathered Pulo Pare, and stood for the main. On the same day passed a small island between Batavia and Bantan, called Maneater's island. On Sunday the 30th, we weathered Wapping and Pulo Babi islands, and the next day, being the 31st, we stood over to the Sumatra shore.

On the morning of this new year's day, being Tuesday, January the 1st, we steered for the Java shore, and continued our course, as the wind permitted us, till three o'clock in the afternoon of the 5th, when we cast anchor on the south-east side of Prince's Island, in eighteen fathom water, in order to recruit our stores, and procure refreshments for the sick, many of whom were much worse than they were at our departure from Batavia. Mr. Banks and Dr. Solander, accompanied by the Captain and other gentlemen, went ashore. We met upon the beach some Indians, by whom we were conducted to one, who, they said, was their king. Having exchanged a few compliments with this person, we entered upon business; but in settling the price of turtle could not agree. Upon this we took leave, the Indians dispersed; and we proceeded along shore in search of a watering-place. We happily succeeded in finding a very convenient one, and had reason to believe, with care in filling, it would prove agreeable to our wishes. On our return, some Indians, who remained with a canoe upon the beach, sold us three turtle, but we were obliged to promise, that we would not tell the king. On Sunday the 6th, we renewed with better success our traffic for turtle. About noon the Indians lowered their demands slowly, inasmuch, that before the evening they accepted our stipulated price, and we had turtle in plenty. In the mean time, the three we had purchased were served to the ship's company, who, till yesterday, had not fed on salt provisions from the time of our arrival at Savu, which was now near three months. Mr. Banks, in the evening, paid a visit to the king, by whom he was received very graciously at his palace, in the middle of a rice field, notwithstanding his majesty was busily employed in dressing his own supper. The day following, Monday the 7th, the Indians resorted to the trading place with fowls, fish, monkeys, small deer, and some vegetables; but no turtle appeared till next day, Tuesday the 8th, after which some were brought to market every day, while we staid, but the whole quantity together was not equal to that we bought the day after our arrival.

Friday the 11th, Mr. Banks having received intelligence from a servant he had hired at Batavia, that the Indians of this island had a town situated near the shore, to the westward, he determined to go in search of the same. With this view he set out in the morning, accompanied by the second lieutenant; and apprehending his visit might not be agreeable to the natives, he told such of them as he met, that he was in search of

No. 10.

plants, which was indeed also true. Having come to a place where there were three or four houses, they met with an old man, of whom they ventured to make a few enquiries concerning the town. He would have persuaded them, that it was at a great distance; but perceiving they proceeded forward, he joined company, and went on with them. The old man attempted several times to lead them out of the way, though without success; but when at length they came within sight of the houses, he entered cordially into their party, and conducted them into the town, the name of which is Samadang. It consists of about four hundred houses, and is divided by a brackish river into two parts, one called the old, and the other the new town. When they had entered the former, they were accosted by several Indians whom they had seen at the trading place, and one of them undertook to carry them over to the new town, at two-pence per head. The bargain being made, they embarked in two small canoes, placed along-side of each other, and lashed together, to prevent their over-setting. They landed safely, though not without some difficulty; and when they came to the new town, the people shewed them every mark of a cordial friendship, shewing them the houses of their king and principal people. Few of the houses were open at this time, the inhabitants having taken up their residence in the rice-grounds, to defend their crops against the birds and monkeys, who without this necessary precaution would destroy them. When their curiosity was satisfied, they hired a large sailing boat for two rupees, value four shillings, which conveyed them to the bark time enough to dine upon one of the small deer, weighing only forty pounds, which proved to be exceeding good and savory food. In the evening we again went on shore, to see how our people went on, who were employed in wooding and watering, when we were told, that an axe had been stolen. Application was immediately made to the king, who, after some altercation, promised, that the axe should be restored in the morning; and it was accordingly brought to us by a man, who pretended, that the thief, afraid of a discovery, had left it at his house in the night.

On Sunday, the 13th, having nearly completed our wood and water, Mr. Banks took leave of his majesty, to whom he had made several trifling presents, and at parting gave him two quires of paper, which he graciously accepted. During their conversation, the king enquired, why the English did not touch at the island as they had used to do. Mr. Banks replied, that the reason was, he supposed, because they found a deficiency of turtle, of which there not being enough to supply one ship, many could not be expected; and to supply this defect, Mr. Banks advised his majesty to breed cattle, buffaloes, and sheep; but he did not seem disposed to adopt this prudent measure.

On Monday, the 14th, we had got on board a good stock of fresh provisions, consisting of turtle, fowl, fish, two species of deer, one about the size of a sheep, the other not bigger than a rabbit; also cocoa-nuts, plantains, limes, and other vegetables. The deer, however, served only for present use, for we could seldom keep one of them alive more than twenty-four hours.

The trade on our parts, was carried on chiefly with Spanish dollars, the natives seeming not to set value upon any thing else; so that our people who had a general permission to trade, parted with old shirts and other articles, which they were obliged to substitute for money to great disadvantage. On Tuesday, the 15th, in the morning, we weighed, with a light breeze at N. E. and stood out to sea. We took our departure from Java Head, which is in latitude 6 deg. 49 min. S. and in longitude 253 deg. 12 min. West.

Prince's Island, where we were stationed about ten days, in the Malay language, called Pulo Selan, and in that of the inhabitants, Pulo Pancitan, is a small island, situated in the western mouth of the strait of Sunda. It is woody, a very small part of it having been cleared. We could perceive no remarkable hill upon it; but a small eminence, just over the landing place,

Z

place, has been named, by the English, the Pike. Formerly this place was much frequented by India ships belonging to various nations, especially from England; but of late they have forsaken it, because the water is bad, and touch either at North Island, or at New Bay, a few leagues distant from Prince's Island, at neither of which places any considerable quantity of other provisions can be procured; and, upon the whole, we must give it as our opinion, that Prince's Island is more eligible than either of them; for though, as we have already observed, the water is brackish, if filled at the lower part of the brook, yet higher up we found it excellent.

The first, second, and perhaps the third ship, that arrives here in the season, may be well supplied with turtle; but such as come afterwards must be content with small ones. What we purchased were of the green kind, and cost us, at an average, about three farthings a pound. They were neither fat nor well flavoured, which circumstance we imputed to their being long kept in pens of brackish water, without food. The fowls are large, and we bought a dozen of them for a Spanish dollar, which is about five pence a piece. The small deer cost us two-pence a piece, and the larger, two only of which were brought to market, a rupee. The natives sell many kinds of fish by hand, and we found them tolerably cheap. Cocoa-nuts, if they were picked, we bought at the rate of a hundred for a dollar; and if taken promiscuously, one hundred and thirty. Plantains we found in abundance; also pine apples, water-melons, jaccas, and pumpions, besides rice, yams, and several other vegetables, all which we purchased at reasonable rates.

In this island the inhabitants are Javanese, and their Raja is subject to the Sultan of Bantam. In their manners and customs they resemble the Indians about Batavia; but they are more jealous of their women, for all the time we were there, we saw not any of them, except one by chance in the woods, as she was running away to hide herself. They profess the Mahomedan religion; but not a mosque did we discover in the whole island. While we were among them, they kept the fast called by the Turks Ramadan, with extreme rigour, not one of them touching a morsel of victuals, nor would they chew their betle till sun-set. Their food is likewise the same with that of the Batavian Indians, except the addition of the nuts of the palm, by eating of which, upon the coast of New Holland, some of our people were made sick, and some of our hogs poisoned. We enquired by what means these nuts were deprived of their noxious deleterious quality, and were informed, that they first cut them into thin slices, and dried them in the sun, then steeped them in fresh water for three months, and afterwards, pressing out the water, dried them a second time in the sun; but after all, we found they are eaten only in times of scarcity, when they mix them with their rice to make it go farther.

The houses of these people are built upon piles, or pillars, and elevated about four or five feet above the ground. Upon these is laid a floor of bamboo canes, at

such a distance from each other, as to leave a free passage for the air from below. The walls also are of bamboo, interwoven hurdlewise, with small sticks, and fastened perpendicularly to the beams which form the frame of the building; it has a sloping roof, so well thatched with palm-leaves, that neither the sun, nor rain can find entrance. The ground-plot, upon which the building is erected, is an oblong square. On one side is the door, and in the space between that and the other end of the house, in the center, towards the left hand, is a window. A partition runs out from each end of the house, which continues so far as to leave an opening opposite the door. Each end of the house therefore, to the right and left of the door, is divided into two apartments, all open towards the passage from the door to the wall on the opposite side. In that on the left hand, next to the door, the children sleep; that opposite to it is for the use of strangers; in the inner room, on the left hand, the master and his wife sleep; and that opposite to it is the kitchen. The only difference between the poor and the rich, with respect to these houses, consists in their size: but we must except the royal palace, and the house of one Gundang, the next man in riches and influence to the king; for those instead of being wattled with sticks and bamboos, are enclosed with boards. These people have occasional houses in the rice fields, at the season when they are infested with the birds and monkeys. They differ only from their town houses, by being raised ten feet instead of four from the ground.

The inhabitants of this island are of a good disposition; and dealt with us very honestly; only like other Indians, and the retailers of fish in London, they would ask twice, and sometimes thrice as much for their commodities as they would take. As what they brought to market belonged, in different proportions, to a considerable number of the natives, they put all that was bought of one kind, as cocoas or plantains together, and when we had purchased a lot, they divided the money that was paid for it among the proprietors, in a proportion corresponding with their contributions. Sometimes, indeed, they would change our money, giving us 240 doits, amounting to five shillings, for a Spanish dollar, and ninety-six, amounting to two shillings, for a Bengal rupee.

The natives of Prince's Island have a language of their own, yet they all speak the Malay language. Their own tongue they call Catta Gunung, the language of the mountains. They say, that their tribe originally migrated from the mountains of Java to New Bay, and then to their present station, being driven from their first settlement by tygers, which they found too numerous to subdue. Several languages are spoken by the native Javanese, in different parts of their island; but the language of these people is different from that spoken at Samarang, though distant only one day's journey from the residence of the Emperor of Java. The following list contains several corresponding words in the languages of Prince's Island, Java, and Malacca.

PRINCE'S ISLAND.	ENGLISH.	JAVANESE.	MALAY.
Jalma,	<i>A man.</i>	Oong Lanang,	Oran Lacki Laki.
Becang,	<i>A woman.</i>	Oong Wadong,	Parampuan.
Oroculatacke,	<i>A child.</i>	Lari,	Anack.
Holo,	<i>The head.</i>	Undafs,	Capalla.
Erung,	<i>The nose.</i>	Erung,	Edung.
Mata,	<i>The eyes.</i>	Moto,	Mata.
Chole,	<i>The ears.</i>	Cuping,	Cuping.
Cutock,	<i>The teeth.</i>	Untu,	Ghigi.
Beatung,	<i>The belly.</i>	Wuttong,	Prot.
Serit,	<i>The backside.</i>	Celit,	Pantat.
Pimping,	<i>The thigh.</i>	Poopoo,	Paha.
Hulloctoor,	<i>The knee.</i>	Duncul,	Lontour.
Metis,	<i>The leg.</i>	Sickil,	Kauki.
Cucu,	<i>A nail.</i>	Cucu,	Cucu.
Langan,	<i>A band.</i>	Tangan,	Tangan.
Ramo Langan,	<i>A finger.</i>	Jari,	Jaring.

In this specimen the different parts of the body are chosen, because they are easily obtained from those whose language is unknown; and it is worthy of observation, that the Malay, the Javanese, and the language in

Prince's Island, have words, which if not exactly similar to those used in the South-Sea Islands, are manifestly derived from the same source, as will appear from the following list.

SOUTH-SEA.	MALAY.	JAVANESE.	PRINCE'S ISLAND.	ENGLISH.
Mata	Mata	Moto	Mata	An eye.
Maa	Macan	Mangan		The car.
Einu	Menuin	Gnumbe		To drink.
Matte	Matte	Matte		To kill.
Outou	Coutou			A louse.
Euwa	Udian	Udan		Rain.
Owhe			Awe	Bamboo cane.
Eu	Soufou	Soufou		A beast.
Mannu		Manny	Mannuck	A bird.
Eyca	Ican	Iwa		A fish.
Tapao		Tapaan		The foot.
Tooura	Udang	Urang		A lobster.
Eufwhe	Ubi	Urve		Yams.
Etannou	Tannam	Tandour		To bury.
Enammou	Gnamuck			A musquito.
Hearu	Garru	Garu		To scratch.
Taro	Tallas	Talus		Cocoa-roots.
Uta	Utan			In-land.

But the similitude in these languages is more remarkable in words expressing number, which seems to prove that they have one common root. Mr. Banks, with the assistance of a negro slave, born at Madagascar, and who was on board an English ship at Batavia, drew up the following comparative table, from whence it will appear, that the names of numbers, in particular,

are in a manner common to all these countries; but we must observe, that in the island of Madagascar, the names of numbers, in some instances, are similar to all these, which is a difficulty not easy to be solved; yet the fact will appear unquestionable from the following list of words, drawn up, as we have observed, by Mr. Banks.

SOUTH-SEA ISLANDS.	MALAY.	JAVANESE.	PRINCE'S ISLE.	MADAGASCAR.	ENGLISH.
Tahie	Satou	Sigi	Hegie	Iffe	One.
Rua	Dua	Lorou	Dua	Rua	Two.
Torou	Tiga	Tullu	Tollu	Tellou	Three.
Haa	Ampat	Pappat	Opat	Effats	Four.
Reina	Lima	Limo	Limah	Limi	Five.
Whency	Annam	Nunnam	Gunnap	Ene	Six.
Hetu	Tudju	Petu	Tudju	Titou	Seven.
Waru	Delapau	Wolo	Delapan	Walon	Eight.
Iva	Sembilan	Songo	Salapan	Sivi	Nine.
Ahoua	Sapoulou	Sapoulou	Sapoulou	Tourou	Ten.

From the similitude between the Eastern Tongue and that of the South-Sea, many conjectures may be formed concerning the peopling of those countries, which cannot easily be referred to Madagascar. The people of Java and Madagascar appear to be a different race: the Javanese has long hair, and his complexion is of an olive cast; whereas a native of Madagascar is black, and his hair woolly; yet this will not conclude against the opinion of their having had common ancestors: and, possibly, the learning of ancient Egypt might run in two courses, one through Africa, and the other through Asia, disseminating the same words in each, especially terms of number, which might thus become part of the language of people who never had any communications with each other.

In the month of February we held on our course, and made the best of our way for the Cape of Good Hope; but now the fatal seeds of disease, our people had imbibed at Batavia, began to appear, with the most alarming symptoms, in dysenteries and slow fevers. Our situation in a short time was truly deplorable, and the ship was little better than an hospital, in which those who did duty, were too few to attend those who were confined to their hammocks. Many of these were in the last stage of the destructive disorder; and almost every night we committed a body to the sea. Mr. Banks was among the number of the sick, and for some time we despaired of his life. In the course of six weeks we buried Mr. Sporing, a gentleman of Mr. Banks's retinue, Mr. Parkinson, his natural history painter, Mr. Green the astronomer, the boatwain, the carpenter, and his mate, Mr. Moukhouse the midshipman, our jolly sail-maker, and his assistant, the cook, the corporal of the marines, two of the carpenters crew, a midshipman, and nine sailors; in all three and twenty persons, besides

the seven that we had buried at Batavia. Such was the havock disease made among our ship's company, though we omitted no means, which we conceived might be a remedy; and to prevent the infection from spreading, we purified the water taken in at Prince's Island with lime, and washed all parts of the bark between decks with vinegar.

Friday the 15th of March, about ten o'clock P. M. we brought the ship to an anchor off the Cape of Good Hope. Capt. Cook repaired immediately to the governor, who cheerfully promised him every refreshment the country afforded; on which a house was hired for the sick, and it was agreed they should be lodged and boarded for two shillings each man per day. Our run from Java Head to the Cape afforded few observations that can be of use to future navigators, but some occurrences we must not pass over in silence. We had left Java Head eleven days before we got the general S. E. trade-wind, during which time, we did not advance above 5 deg. to the southward, and 3 deg. to the W. having an unwholesome air, occasioned probably by the load of vapours, which the eastern wind, and westerly monsoons, bring into these latitudes, both of which blew in these seas, at the time we happened to be there. Our diseases were certainly aggravated by those poisonous vapours, and unwholesome air, particularly the flux, which was not in the least degree checked by any medicine; so that whoever was seized with it, considered himself as a dead man; but we no sooner got into the trade wind, than we felt its salutary effects. It is true, we buried several of our crew afterwards, but they were such as had been taken on board in a state so low and feeble, that there was scarcely a possibility of their recovery. We suspected at first, that this dreadful disorder might have been generated by the water that

we took on board at Prince's Island, or by the turtle we purchased there; but this suspicion we found to be groundless; because all the ships that came from Batavia at the same season, suffered in like manner, and some even more severely, though none of them touched at Prince's Island in their way.

Not many days after our departure from Java we were attended by the boobies for several nights successively, and as these birds are known to roost every night on shore, we concluded land was not far distant; perhaps it might be the island of Selam, which in different charts, is very differently laid down both in name and situation. After these birds had left us, we were visited by no more, till we got nearly a-breast of Madagascar, where in latitude 27 deg. three quarters S. we saw an albatross, the number of which increased every day, with others of different kinds, particularly one about the size of a duck, of a very dark brown colour, with a yellowish bill; and they became more numerous as we approached the shore. When we got into soundings, we were visited by gannets, which we continued to see as long as we were upon the bank that stretches off Anguillas to the distance of forty leagues, and extends along shore to the eastward, from Cape False, according to some charts, one hundred and sixty leagues. The real extent of this bank is not exactly known; it is however useful as a direction to shipping when to haul in, in order to make the land.

At the time the Endeavour lay at the Cape of Good Hope, the Houghton Indiaman sailed for England. She had buried near forty of her crew, and when she left the Cape, had many of her hands in a helpless condition, occasioned by the scurvy. Other ships likewise experienced a proportionable loss by sickness; so that our sufferings were comparatively light, considering that we had been absent near three times as long. We continued at the cape till the 13th of April, in order to recover the sick, procure stores, and to do some necessary work upon the ship and rigging. When this was finished we got all the sick on board, several of whom were still in a dangerous state; and on Sunday the 14th, having taken leave of the governor, we unmoored, and got ready to sail.

The history of Caffraria is well known in Europe, and a description of the Cape of Good Hope has been given by most of our circumnavigators; yet we think a particular account of this country will be acceptable to our numerous subscribers; and they will meet with some particulars which fell under our observation, that have either been wholly omitted or misrepresented in other narratives.

Caffraria, or Caffreriä is well situated for navigation and commerce, both which advantages are almost wholly neglected. The interior part of the country is fertile, but wants the benefit of cultivation. The inhabitants are naturally sagacious, but their faculties are absorbed in indolence; thus both the lands and minds of the people require improvement; but lest cultivation in the first should introduce luxury, and information in the last produce disobedience, neither of these are encouraged by the politic Dutch, who possess a great part of the sea coast. This country extends about seven hundred and eighty miles from N. to S. that is, from Cape Negro to the Cape of Good Hope, from hence turning N. E. to the mouth of the river Spiritu Santo, it runs about six hundred and sixty miles; and proceeding up the country almost to the equinoctial line, it is about one thousand seven hundred and forty miles farther. In some places it is nine hundred, and in others not above six hundred broad. Caffraria is named from the Caffres, its inhabitants; though some authors affirm, that this name is a term of reproach given by the Arabs to all who have but confused notions of the deity, and which the Portuguese have by mistake applied to these people.

The Cape of Good Hope, which is the most southern part of Africa, was first discovered, A. D. 1493, by Bartholomew Diaz, admiral of a Portuguese fleet, who on account of the boisterous weather he met with

when near it, distinguished it by the name of Cabodos totos Tormentos, or the Cape of all plagues; since which, no place in the universe has been more spoken of, though little of the country, except the coast, has been penetrated or known. The reason why it has so much attracted the attention of mariners of all nations, is, their being under a necessity of frequently calling there for water or other refreshments, and also of doubling it, in their voyages to the East-Indies. But John king of Portugal, not liking the name which his admiral had bestowed upon this large promontory, changed it to that of Cabode Buä Esperança, the "Cape of Good Hope," which appellation it hath ever since retained.

Neither Diaz, nor his successor Vasco de Gama, though they saw the Cape, thought proper to land: but in 1498 the Portuguese admiral, Rio del Infanta, was the first who ventured ashore; and from his report, Emanuel, king of Portugal, on account of the eligibility of the situation, determined to establish a colony there; but the Portuguese, who are naturally pusillanimous, having taken it into their heads, that the inhabitants of the Cape were cannibals, were too much afraid of being devoured, to obey their sovereign in making the settlement he intended: however, some time after, another body of those timid adventurers made good their landing, under the conduct of Francis d'Almeyda, a viceroy of Brasil, when the Portuguese were shamefully defeated by the scarce armed, and unwarlike natives. The viceroy and fifty of his men being killed in the engagement, the remainder retired with precipitation to their ships. The Portuguese were much disappointed and chagrined at the idea of such martial superiority in a people by them deemed at once savage and despicable. They determined to be revenged; but not having magnanimity enough to shew a becoming resentment, they contrived a most inhuman and cowardly expedient. About two years after, touching at the cape, they landed with all the appearance of amity, accompanied with strong professions of friendship, and under this mask brought with them a large cannon loaded with grape shot. The unsuspecting natives, overjoyed by the gift of so great a treasure, began to drag it away by the means of two long ropes, which had been previously fastened to the muzzle. Great numbers laid hold of the ropes, and many others went before by way of triumph, when the treacherous Portuguese firing off the cannon, a prodigious slaughter ensued, as most of the people stood within the range of the shot. Many were killed, several wounded; and the few who escaped, abandoned with the utmost precipitation the fatal present.

About the year 1600, the Dutch began to touch at the Cape, in their way to and from the East-Indies; and becoming annually more sensible of the importance of the place, they effected a settlement in 1650, which since that time hath risen to great power and opulence, and been of essential service to that nation. M. Van Ricbeeck, a surgeon, in his return from India, observing the conveniency of the place for a settlement, and laying before the Dutch East-India Company a plan of its advantages, the scheme was approved, and the projector appointed governor. This Adventurer sailing with four ships to the cape, entered into a negotiation with the people, who, in consideration of fifty thousand guilders, or four thousand three hundred and seventy-five pounds sterling, agreed to yield up to the Dutch a considerable tract of country round the Cape. Van Ricbeeck, in order to secure his new purchase, immediately erected a strong square fort; laid out a large garden, and planted it with a great variety of the productions from Europe, that he might render the place as commodious and agreeable as possible. Having thus successfully founded a settlement, the Dutch Company proposed, in order the more effectually to establish it, that every man, who would settle three years at the Cape, should have an inheritance of sixty acres of land, provided that during that space he would so improve his estate, as to render it sufficient to maintain himself, and contribute somewhat towards the maintenance of the

the garrison; and at the expiration of the time, he might either keep possession of it, or sell it, and return home. Induced by these proposals, many went to seek their fortunes at the Cape, and were furnished on credit with cattle, grain, plants, utensils, &c. The planters, however, at length grew weary of their habitations for want of conjugal society; therefore the governors of the company, to prevent their leaving the place, provided them with wives from the Orphan-houses, and other charitable foundations. In process of time they greatly increased, and spread themselves farther up the country, and along the coast, till they occupied all the lands from Saldanna Bay, round the southern point of Africa, to Noffel Bay, on the E. and afterwards purchased Terra de Natal, in order to extend their limits still farther.

It appears, however, that on the first settlement of the Dutch at the Cape, all the Hottentot tribes did not acquiesce in the sale of the country to foreigners; for the Guynemains dissented from the agreement of the others, and, in 1659, disputed the possession of the purchased territories with the Dutch. They always made their attack in boisterous weather, as thinking the fire-arms then of less use and efficacy; and upon these occasions they would murder indiscriminately all the Europeans they could meet, burn down their houses, and drive away their cattle. At length a Hottentot, called by the Dutch Doman, who had resided some time at Batavia, and afterwards lived at Cape Town, retired to his countrymen, and persuaded them, that it was the intent of the Europeans to enslave them, and stirred them up to war. Accordingly they took up arms, and, being headed by Doman, attended by another chief named Garabinga, they committed great depredations. But the Hottentots themselves at length growing tired of the war, one hundred of them, belonging to one nation, came unarmed to the Dutch fort, with a present of thirteen head of fine excellent cattle, in order to sue for peace. This, it may be imagined, was readily granted by the Dutch, who were heartily sick of a contest, in which themselves were such great losers, without reaping any advantages from it.

Notwithstanding all that has been said to the contrary, no country we saw during the voyage, makes a more forlorn appearance, or is in reality a more sterile desert. The land over the Cape, which constitutes the peninsula formed by Table Bay on the N. and False Bay on the S. consists of high mountains, altogether naked and desolate: the land behind these to the E. which may be considered as the Isthmus, is a plain of vast extent, consisting almost wholly of a light kind of sea sand, which produces nothing but heath, and is utterly incapable of cultivation. All the spots that will admit of improvement, which together bear about the same proportion to the whole as one to one thousand, are laid out in vineyards, orchards, and kitchen grounds; and most of these little spots lie at a considerable distance from each other. There is also the greatest reason to believe, that in the interior parts of the country, that which is capable of cultivation, especially what is situated at no great distance from the coast, does not bear a greater proportion to that which is barren; for the Dutch told us, that they had settlements eight and twenty days up the country, a distance equal at least to nine hundred miles, from which they bring provisions to the Cape by land; so that it seems reasonable to conclude, that provisions are not to be had within a less compass. While we were at the Cape, a farmer came thither from the country, at the distance of fifteen days journey, and brought his children with him. We were surprised at this, and asked him, if it would not have been better to have left them with his next neighbour. Neighbour! said the man, I have no neighbour within less than five days journey of me. Surely the country must be deplorably barren in which those who settle only to raise provisions for a market, are dispersed at such distances from each other. That the country is every where destitute of wood is a certain fact; for timber and planks are imported from Batavia, and fuel is almost as dear as food. We saw not a tree,

No. 11,

except in plantations near the town, that was six foot high; and the stems, that were not thicker than a man's thumb, had roots as thick as an arm or leg, such is the influence of the winds here to the disadvantage of vegetation, without considering the sterility of the soil.

Cape Town is the only one the Dutch have built here, and it consists of about a thousand houses neatly built of brick, whitened in general on the outside. They are covered only with thatch, for the violence of the S. E. winds would render any other roof inconvenient and dangerous. The streets are broad and commodious, crossing each other at right angles. In the main one is a canal, on each side of which is planted a row of oaks, that have grown tolerably well, and yield an agreeable shade. In another part of the town is also a canal, but the slope of the ground in the course of both is so great, that they are furnished with locks at intervals of little more than fifty yards. The houses in general have pleasant gardens behind, and neat court yards before them. Building, as well as tillage, is greatly encouraged here, and land given for either purpose to those who chuse to accept of it; but then the government claims an annual tenth of the value of the former, and produce of the latter, and a tithe of all purchase money when estates are sold. The town extends from the sea shore to the Company's garden, spreading along Table Bay. The fort is in a valley at a small distance, its form pentagonal, it commands the landing-place, and is garrisoned by two hundred soldiers. The governor's storehouses are within it, other officers besides himself have apartments here, as well as six hundred servants: the same number of slaves are lodged in a commodious building in the town, which is divided into two wards, the one for the men, the other for the women; and there is a house of correction for the reception of dissolute persons of either sex. The hospital for sick seamen is of essential use to the Dutch fleets in going to or returning from India. The church is a large edifice, elegantly plain; but the roof and steeple are thatched, for the reason already mentioned. Thatching indeed, from the nature of the hurricanes, seems absolutely necessary; but from the method in which it was formerly done, it appears that it was frequently attended with danger, and we were informed, there used to be shelving pent houses erected on both sides the streets, to shelter passengers in rainy weather; but these brought the inhabitants under such dangers and inconveniences, that they were all pulled down by order of government. Sailors and Hottentots were continually assembling, and smoking their pipes under them, and sometimes, through carelessness set them on fire. The government laid hold of that occasion to rid the streets of those fellows that were continually pestering them, by publishing an order, which is still in force, and from time to time republished, that no Hottentot, or common sailor, shall smoke in the street, and that upon presuming so to do they should be tied to the whipping post and be severely lashed. This has kept the streets clear of all who have no business there; for it is with great difficulty that either the seamen or Hottentots can forbear smoking while they are awake, if they have tobacco, which they are seldom without. What is most to be admired at the Cape is the Company's garden, where they have introduced almost all the fruits and flowers that are found in the other three quarters of the globe; most of which are improved, and flourish more than they did in their respective climates and countries from whence they were brought; and the garden is watered with springs that fall down from Table mountain just above them. Apples and pears are planted here, with the grapes of Asia, as well as those of Europe, all of a delicious flavour. Here are also excellent lemons, oranges, citrons, figs, Japan apples, and a great variety of other fruits. In this place a much greater proportion of the inhabitants are Dutch than in Batavia; and as the town is supported principally by entertaining strangers, and supplying them with necessities, every man to a certain degree, imitates the manners and customs of the nations with which he is chiefly concerned. The ladies, however, are so faithful to the

2 A

mode

mode of their country, that not one of them will stir without a chaudpied, or chauffet, which is carried by a servant, that it may be ready to place under her feet, whenever she sits down: though few of these chauffets have fire in them, which indeed the climate renders unnecessary.

Notwithstanding the natural sterility of the climate, industry has supplied this place with all the necessaries, and even luxuries of life in the greatest profusion. The beef and mutton are excellent, though the oxen and sheep are natives of the country: the cattle are lighter than ours, more neatly made, and have horns that spread to a much wider extent. The sheep are clothed with a substance between wool and hair, and have tails of an enormous size: we saw some that weighed twelve pounds, and we heard there were many much larger. Good butter is made from the milk of cows, but the cheese is very much inferior to our own. Here are hogs and a variety of poultry; also goats, but these last are never eaten. Hares are to be found exactly like those in Europe; likewise many kinds of antelopes; quails of two sorts, and bustards, all well flavoured, but not juicy. The fields produce European wheat and barley; the gardens European vegetables; fruit of all kinds; besides plantains, guavas, jambu, and other Indian fruits, but these are not in perfection; the plantains, in particular, are very bad, and the guavas no larger than gooseberries. The vineyards also produce wines of various sorts, but not equal to those of Europe, except the Constantia, which is made genuine only at one vineyard, about ten miles distant from the town. There is another vineyard near it, where wine is made, and called by the same name, but it is greatly inferior.

With respect to the animals of this country, the wild differ in nothing from those found in other parts. There are great numbers of domestic animals in the various colonies and settlements at the Cape, and the woods and mountains abound with wild beasts. The horses, which were brought originally from Persia, are of a bay or chestnut colour, and rather small. The dogs have a very unsightly appearance, and are of little use. Among the wild beasts, the elephant claims the first place. The rhinoceros is of a dark ash colour, and has a snout like a hog. A horn projects about two feet from the nose, resembling in shape a plough share, and of a grey dingy colour. With this he tears up the ground, pulls up trees by their roots, throws large stones over his head, and rips up the elephant, to whom he is a mortal enemy. Another horn of about six inches long, turns up from his forehead. His legs are short, his ears small, and his sense of smelling surprizingly acute. When he scents any thing he pursues in a right line, and tears up every thing in his way; but his eyes being exceeding small and fixed, he can only see straight forward, so that it is easy to avoid him by stepping aside, as he is a long time in turning himself about, and longer still in getting sight again of the object. He will not attack a man without being provoked, or unless he is dressed in scarlet. When he has killed any creature, he licks the flesh from its bones with his rough tongue, which is like a rasp. He feeds much on herbs, shiftles, and a plant resembling juniper, and which, from its fondness of it, is called rhinoceros-bush. The blood, skin, and horn of this animal, are medicinally used, and said to be very efficacious in many disorders. Wine, poured into cups made of the horn, bubbles up in a strange kind of fermentation, appearing as if boiling. Should a small portion of poison be put into the wine, the cup splits; but if poison only is poured into the cup, it flies into a thousand pieces; hence cups made of this horn are deemed excellent safeguards, and, on that account, independent of their salubrious qualities, are highly valued. At the Cape, wolves are of two kinds; the one resembles a sheep-dog, and is spotted like a tyger; the other is like an European wolf: they both prowl about, and do great mischief in the night-time, but lie concealed in the day. Lions, tigers, leopards, &c. also abound here, and are so troublesome, that the person who kills one of either

fort, is rewarded with twenty-five florins, or fifty thillings. The flesh of the lion is esteemed equal to venison, and the fat is much valued. Here are much larger buffaloes than in Europe. They are of a brown colour: the horns are short, and curve towards the neck, where they incline to each other. Between them is a tuft of hair upon the forehead, which adds to the fierceness of the look. The skin is exceeding hard, and the flesh rather tough. He is a strong fierce creature, and is enraged at any thing red, like many other animals. We saw here elks five feet high, with horns a foot long. This is a very handsome creature, having a beautiful head and neck, slender legs, and soft smooth hair of an ash colour. Their upper jaw is larger than the under, the tail about a foot in length, and the flesh by the Cape Epicures is said to exceed the best beef. They run swift, and climb the rocks with great agility, though they usually weigh about four hundred pounds each. Another singular animal is that called stink box, from its offensive smell both living and dead; it is about the size of a common house dog, and made much like a ferret. The goats are of various species. One, called the blue goat, is of a fine azure colour. The spotted goat is larger, and beautifully marked with brown, white, and red spots. The horns are a foot long. The flesh fine eating. The rock-goat is no larger than a kid, but very mischievous in the plantations. The diving-goat is much like the tame one, and receives its name from its method of squatting down in the grass to hide itself. We saw another animal called a goat, without any additional appellation, it is of the size of a hart, and extremely beautiful. The hair of the sides and back is grey, streaked with red, and that on the belly white. A white streak passes from his forehead to the ridge of his tail, and three others surround his body in circles. The female hath no horns; but those of the male are three feet in length, and the flesh is exceedingly delicate. The horns of the hart do not branch like those of Europe; but the roebuck is in every respect like ours. Wild cats are of several sorts. The first the Dutch call the civit cat, not that it is really the animal of that name, but because of the fine scent of the skin. The next is called the tyger-cat, from its being very large, and spotted like a tyger. The third sort is the mountain cat, which, as well as the tame cat, resembles those of Europe. The fourth species is denominated the blue cat, from its colour, having a fine blue tinge, with a beautiful red list down its back. There is a species of mice peculiar to this country, called the rattle-mouse, which is about the size of a squirrel, and makes a rattling noise with its tail. It is very nimble, lives upon nuts and acorns, and purs like a cat. Among the hogs with which this country abounds, is the wild hog, or rather wild boar, which is very fierce, and harbours in woods; and the earth hog, which is of a red colour, and without teeth: this lodges like a badger in holes, and feeds upon ants; these he procures by forcing his long rough tongue into their hills, from whence he draws it with a great number glued thereto. Many jackalls, some ermines, baboons, monkeys, &c. are found about the cape; and frequently do great mischief in the gardens, orchards, and vineyards. The porcupine is very common, and its flesh esteemed delicious. There are two sorts of wild asses in this country, one of which is a beautiful creature, called the zebra, and bears a greater affinity in make and shape to the horse than the ass. Indeed the ears are somewhat like those of the latter animal, but in all other respects it has a much more noble appearance. It is admirably well made, exceeding lively, and so extremely swift, that it throws almost every pursuer at a distance. Its legs are fine; it has a twisted tail, round fleshy haunches, and a smooth skin. The females are white and black, and the males white and brown. These colours are placed alternately in the most beautiful stripes, and are parallel, distinct, and narrow. The whole animal is streaked in this admirable manner, so as to appear to a distant beholder as if covered with ribbons. Most naturalists affirm, that the zebra never can be tamed. That which was presented

fented to her present majesty queen Charlotte, and kept several years at the stables near Buckingham-gate, continued vicious till its death, though it was brought over young, and every possible means used to render it tractable: it fed upon hay, and the noise it made rather resembled the barking of a mastiff dog, than the braying of an ass. The camelopardalis, we were informed, has been found in the countries round the Cape. Captain Carteret, having, by order of his present majesty, performed a voyage round the world in the Swallow sloop of war, mentions this animal in a letter to the late Dr. Matty, secretary to the Royal Society. "From the scarcity of this creature (says he) as I believe none have been found in Europe, since Julius Cæsar's time (when I think there were two of them at Rome) I imagine a more certain knowledge of its reality will not be disagreeable to you, as the existence of this fine animal has been doubted by many. The present governor of the Cape of Good Hope has sent out parties of men on inland discoveries, some of which have been absent from eighteen months to two years, in which traverse they have discovered many curiosities. One of these parties crossed many mountains and plains, in one of which they found two of those creatures, but they only caught the young one. This they endeavoured to bring alive to Cape Town, but unfortunately it died. They took off his skin, and it has, as a confirmation of this truth, been sent to Holland." The skin here alluded to is now in the cabinet of natural history at Leyden. Linnæus ranks this animal among the deer kind. Its head is like that of a stag; the horns are blunt, about six inches long, covered with hair, but not branched. The neck resembles a camel's, only longer, being near seven feet. It has a mane like that of a horse; feet, ears, and a tongue like those of a cow; slender legs, the fore ones being considerably longer than the hinder; the body is but small, covered with white hair, and spotted with red; the tail is long, and bushy at the end; the upper jaw contains no fore teeth; he moves both the fore feet together when he runs, and not one after the other like other animals; he is eighteen feet long from the tail to the top of the head, and is sixteen feet from the ground when he holds up his head.

A great variety of birds and fowls are found at the Cape, both wild and tame. Here are three sorts of eagles, namely, 1. The bone breaker, who feeds on tortoises; to obtain the flesh of which it uses this singular method. Having carried the tortoise aloft in the air, it drops it upon some hard rock, by which means the shell is broken, and the eagle can easily come at its prey. 2. The dung-eagle, which tears out the entrails of animals to subsist on, and, though no bigger than a common goose, is exceeding strong and voracious. 3. The duck-eagle, so called because it feeds principally on ducks. Here are also wild geese of three sorts. 1. The water goose, which resembles ours. 2. The mountain goose, which is the largest of all, having a green head, and green wings. 3. The crop goose, so named from its remarkable large crop, of which bags, pockets, and tobacco-pouches are made. All these kinds of geese are such good eating, so plentiful, and so easily taken, that the people of the Cape do not think the tame goose worth the trouble of breeding. But of all the numerous birds that are to be found here, the flamingo is one of the most singular. It has a long neck, and is larger than a swan: the legs are remarkably long, and of an orange tawny, and the feet are like those of a goose: the bill contains blue teeth with black points; the head and neck are entirely white; the upper part of the wings are of a bright flame colour, and the lower black.

Reptiles are very numerous at the Cape, particularly the following serpents, 1. The tree serpent, so called from resembling the branch of a tree, and from being fond of winding itself about trees. 2. The ash coloured asp, speckled with white and red, which is several yards long. 3. The shoot serpent, so named from the amazing velocity with which it darts itself at an enemy. Some call it the eye serpent, on account of the numerous white spots resembling eyes, with which its

skin is marked. 4. The blind slow-worm, a black scaly serpent, spotted with brown, white, and red. 5. The thirst serpent, or inflamer, a most venomous and dangerous serpent, about three quarters of a yard long; it has a broad neck, black back, and is very active. 6. The hair serpent, which is about three feet in length, as thick as a man's thumb, and received its name from its yellow hair. Its poison is so malignant, that nothing but the serpent stone can prevent its being mortal. This stone is said to be an artificial composition, prepared by the Bramins in India, who keep the secret to themselves. It is shaped like a bean, in the middle whitish, the rest of a sky-blue. Whenever this is applied, it sticks close without bandage or support, and imbibes the poison till it can receive no more, and then drops off. Being laid in milk, it purges itself of the venom, turning the milk yellow, and so is applied again, till by its not sticking, it proves that the poison is exhausted.

The neighbouring sea affords a plentiful supply of fish to the inhabitants of the Cape. The meat of the sea cows is much admired. The flying fish, which has wings like a bat, is reckoned a great delicacy. The brown fish is as big as an ox, and is deemed good food either fresh or salted. The bennet is near three feet long, and weighs about seven pounds: the eyes and tails are red; the fins yellow, and the scales purple, with gold streaks. The meat is of a crimson colour, and so remains after it is dressed; nevertheless it is delicious eating. The gold fish has a streak from head to tail, circles round his eyes of a gold colour, it is eighteen inches long, weighs about a pound, and its flesh of an exquisite taste. The brassem is found only about the Cape. Of this fish there are two sorts; the one has a black back, and purple head; the other is of a dark blue colour, and the former is rounder than the latter. They are both cheap and wholesome food. The stone brassem is good either fresh or salted, resembles a carp in make, but is more delicious in taste. One species of this fish is called flat-nose, from the shape of the head, and is much more valued than the other sort. The red stone fish is exceeding beautiful to the eye, and exquisite to the taste: the back is scarlet spotted with blue, and bespangled with gold; the eyes are of a bright red, and surrounded with a silver circle, and the belly is of a pale pink colour, has a shining silver tail, resembles a carp both in shape and taste, and weighs about a pound. Of shell-fish, which are innumerable, there is a singular species called Klin-kousen, which has an upper and under shell, thick, rough, twisted, and incrusted. In vinegar the crust will drop off, and the shell exhibits an admirable pearl colour. Sea-funs and sea-stars, are small round shell-fish, and receive their denominations from the great variety of prickles, which shoot from them like rays of light. The fish called pagger has a prickly shell, and is much dreaded by the people of the Cape, as a wound from one of its protuberances turns to a mortification, unless great care is taken to prevent it. The sea-spout resembles a piece of moss sticking fast to the rocks. It is of a green colour, emits water, and within is like a tough piece of flesh. The torpedo, or cramp-ray is a very curious fish. The body is circular, the skin soft, smooth and yellow, marked with large annular spots; the eyes small, and the tail tapering. It is of different sizes, and weighs from five to fifteen pounds. The narcotic or benumbing quality of this fish was known to the ancients, and hath furnished matter of speculation to the philosophers of all ages. If a person touches it when alive, it instantly deprives him of the use of his arm, and has the same effect if he touches it with a stick. Even if one treads upon it with a shoe on, it affects not only the leg, but the thigh upwards. They who touch it with the feet are seized with a stronger palpitation than even those who touch it with the hand: this numbness bears no resemblance to that which we feel when a nerve is a long time pressed, and the foot is said to be asleep: it rather appears to be like a sudden vapour, which passing through the pores in an instant, penetrates to the very springs of life, from whence it diffuses itself all over the body,

body, and gives real pain. The nerves are so affected, that the person struck imagines all the bones of his body, and particularly those of the limb that received the blow, are driven out of joint. All this is accompanied with a universal tremor, a sickness of the stomach, a general convulsion, and a total suspension of the faculties of the mind. In short, such is the pain, that all the force of our promises and authority could not prevail upon a seaman to undergo the shock a second time. It has been observed, that the powers of this fish decline with its strength, and intirely cease when it expires. This benumbing faculty is of double use to the torpedo: first it enables it to get its prey with great facility; and secondly it is an admirable defence against its enemies, as by numbing a fish of superior force with its touch, it can easily escape. The narcotic power of the torpedo is greater in the female than the male. According to Appian, it will benumb the fisherman through the whole extent of hook, line and rod. The flesh of this remarkable fish having, however, no pernicious quality, is eaten by the people of the Cape in common with others.

The air at the Cape of Good Hope is salutary in a high degree; so that those who bring diseases from Europe generally recover health in a short time; but the diseases that are brought hither from India are not so certainly cured. The weather at the cape may be divided into two seasons, namely, the wet monsoon, and the dry monsoon; the former begins in March, and the latter in September; so that summer commences at the Cape about the time that it concludes with us. The inconveniences of the climate are excessive heat in the dry season, and heavy rains, thick fogs, and N. W. winds in the wet season. Thunder and lightning are never known here but in March and September. Water seldom freezes, and when it does, the ice is but thin, and dissolves upon the least appearance of the sun. In the hot weather, the people are happy when the wind blows from the S. E. because it keeps off the sea-weeds which otherwise would float to the shore, and corrupt there. The appearance of two remarkable clouds, which frequently hang over the summits of the two mountains of Table-hill and Devil-hill, commonly enable the inhabitants of this country to prognosticate what weather will happen. The clouds are at first small, but gradually increasing, they at length unite into one cloud, which envelops both mountains, when a terrible hurricane soon ensues. A gentleman, who resided many years at the Cape, says, "The skirts of this cloud are white, but seem much compacter than the matter of common clouds. The upper parts are of a lead colour, owing to the refracted rays of light. No rain falls from it, but at times it discovers great humidity, when it is of a darker hue; and the wind issuing from it is broken, raging by gusts of short continuance. In its usual state, the wind keeps up its first fury, unabated, for one, two, three, or eight days, and sometimes a whole month. The cloud seems all the time undiminished, though little fleeces are seen torn from the skirts from time to time, and hurried down the sides of the hills, vanishing when they reach the bottom; so that during the storm the cloud seems to be supplied with new water. When the cloud begins to brighten up, those supplies fail, and the wind proportionably abates. At length the cloud growing transparent, the wind ceases." During the continuance of the S. E. winds, the Table-valley is torn by furious whirlwinds. If they blow warm, they are generally of short duration, and in this case the cloud soon disappears; but when the wind blows cold, it is a sure sign it will last long, except an hour or two at noon, or midnight when it seems to recover new strength, and afterwards renews its boisterous rage.

Near the Cape the water of the ocean is of a green colour, arising principally to the coral shrubs, and the weed called tromba. The first, while in the water, are green and soft; but when exposed to the air, they grow hard, and change their colour to white, black, or red. The latter are ten or twelve feet in length, hollow within, and when dry, become firm and strong. They

are often framed into trumpets, and the sound they produce is very agreeable to the ear.

The sources of the rivers in this country are in the mountains: they glide over a gravelly bottom, are clear, pleasant, and salubrious; but other streams are dark, muddy, and unwholesome. Here are a few brackish springs, whose waters medicinally used, greatly purify the blood; and several hot baths are very efficacious in various disorders. Upon the whole, the reputation of the Cape waters is so great, that every Danish ship returning from India, is obliged to fill a large cask with the clear sweet water that abounds here for the use of his Danish majesty.

The soil in general about the Cape consists of a clayey earth, and is so fat, that it requires but little manuring. White and red chalk are found in abundance; the former is used by the Dutch, to whitewash their houses, and the latter by the Hottentot women to paint their faces. Various bituminous substances of several colours are found in Drakenstoin colony, particularly a kind of oil which trickles from the rocks, and has a very rank smell. With respect to minerals, silver ore has been found in some of the mountains, and also several iron mines. The Namaqua Hottentots, who are situated above three hundred miles from the cape, bring copper to trade with the Dutch.

When we speak of agriculture, it is to be observed, that the Europeans of the Cape, and their lands, are implied; for the Hottentots in general detest the very idea of cultivation, and would sooner starve than till the ground, so greatly are they addicted to sloth and indolence. The working of the plough here is so laborious from the stiffness of the soil, that it frequently requires near twenty oxen to one plough. The sowing season is in July, and the harvest about Christmas. The corn is not thrashed with a flail, but trod out by horses or oxen, on an artificial floor made of cow-dung, straw, and water, which when mixed together cements, and soon becomes perfectly hard. It is laid in an oval form. The cattle are confined by halters which run from one to the other, and the driver stands in the middle, where he exercises a long stick to keep them continually to a quick pace. By this method half a dozen horses will do more in one day, than a dozen men can in a week. A tythe of the corn belongs to the Dutch Company, and the rest they purchase at a price stipulated between them and the husbandmen.

We have already observed of the inhabitants of the Cape, that their number bears a greater proportion to the natives and strangers, than those in Batavia; and have only to add, that the women in general are very handsome: they have fine clear skins, and a bloom of colour that indicates a purity of constitution, and high health. They make the best wives in the world, both as mistresses of a family and mothers, and there is scarcely a house that does not swarm with children. The common method in which strangers live here, is to lodge and board with some of the inhabitants, many of whose houses are always open for their reception; the rates are from five shillings, to two a day, for which all necessaries are found. Coaches may be hired at twenty-four shillings a day, and horses at six; but the country affords very little temptation to use them. There are no public entertainments, and to those that are private, all strangers of the rank of gentlemen are always admitted.

We come now to speak of the Caffres or natives of this country, none of whose habitations, where they retain their original customs, are within less than four days journey from Cape Town; those that we saw at the Cape were all servants to Dutch farmers, whose cattle they take care of, and are employed in other drudgery of the meanest kind. There are sixteen Hottentot nations, which inhabit this southern promontory; at least, there are so many that hold a correspondence with the Dutch, though it is presumed, there are many more to the northward.

The stature of the Hottentot men is from five to six feet in height. Their bodies are proportionable, and well

well made: they are seldom either too fat or lean, and scarce ever any crooked or deformed persons amongst them, any farther than they disfigure their children themselves by flattening and breaking the gristles of their noses, looking on a flat nose as a beauty. Their heads as well as their eyes, are rather of the largest: their lips are naturally thick; their hair black and short like the negroes, and they have exceeding white teeth: and after they have taken a great deal of pains with grease and foot to darken their natural tawny complexions, resemble the negroes pretty much in colour. The women are much less than the men; and what is most remarkable in them, is a callous flap or skin that falls over the pudenda, and in a manner conceals it. The report of which usually excites the curiosity of the European sailors, to visit the Hottentot villages near the cape, where a great many of those ladies, on seeing a stranger, will offer to satisfy his curiosity for a half-penny, before a crowd of people, which perfectly spoils the character that Mr. Kolben has given of their modesty.

The head of the men are covered with grease and foot mixed together; and going without any thing else on their heads in the summer-time, the dust sticks to it, and makes them a very filthy cap, which they say cools them, and preserves their heads from the scorching heat of the sun; and in the winter, they wear flat caps of cat-skin or lamb-skin, half dried, which they tie with a thong of the same leather under their chins. The men also wear a krosse or mantle, made of sheep-skins or other skins, over their shoulders, which reaches to the middle; and, being fastened with a thong about their neck, is open before. In winter they turn the woolly or hairy sides next their backs, and in summer the other: this serves the man for his bed at night; and this is all the winding-sheet or coffin he has when he dies. If he be a captain of a village, or chief of his nation, instead of a sheep-skin, his mantle is made of tyger-skins, wild cat-skins, or some other skins they set a value upon: but though these mantles reach no lower, generally, than their waists, yet there are some nations who wear them as low as their legs, and others that have them touch the ground.

A Hottentot also hangs about his neck a greasy pouch, in which he keeps his knife, his pipe and tobacco, and some dahka (which intoxicates like tobacco) and a little piece of wood, burnt at both ends, as a charm against witchcraft. He wears also three large ivory rings on his left arm, to which he fastens a bag of provisions when he travels. He carries in his right hand two sticks, the first called his kirri, which is about three feet long, and an inch thick, but blunt at both ends; the other, called his rackum-stick, about a foot long, and of the same thickness, but has a sharp point, and is used as a dart, to throw at an enemy or wild beast; which he seldom misses, if he be within distance. In his left hand he has another stick, about a foot long, to which is fastened a tail of a fox or wild cat; and this serves him as a handkerchief to wipe off the sweat. They wear a kind of sandals, also made of the raw hide of an ox or elephant, when they are obliged to travel through stoney countries; and sometimes have buskins, to preserve their legs from bushes and briars; but ordinarily their legs and thighs have no covering.

The women wear caps, the crowns whereof are a little raised; and these are made of half dried skins, and tied under their chins. They scarce ever put them off night or day, winter or summer. They usually wear two krosses or mantles, one upon another, and, as these are only fastened with a thong, about their necks, they appear naked down to the middle: but they have an apron, larger than that of the men to cover them before, and another of still larger dimensions that cover their hind parts. About their legs they wrap thongs of half dried skins, to the thickness of a jack-boot, which are such a load to them, that they lift up their legs with difficulty, and walk very much like a trooper in jack boots: this serves both for a distinction of their sex, and for ornament. But this is not all their finery: if they are people of any figure, instead of a sheep skin, they wear a tyger skin, or a mantle of wild cat skin. They have also a pouch

hanging about their necks, in which they carry something to eat whether they are at home or abroad, with their dahka, tobacco, and pipe. But the principal ornaments both of men and women are brais or glass beads, with little thin plates of glittering brais and mother of pearl, which they wear in their hair, or about their ears. Of these glass or brais beads strung, they also make necklaces, bracelets for the arms, and girdles, wearing several strings of them about their necks, waist, and arms, chusing the smallest beads for their necks: those are finest that have most strings of them, and their arms are sometimes covered with bracelets from the wrist to the elbow. The largest beads are on the strings about the middle: in these they affect a variety of colours, all of which the Dutch furnish them with, and take their cattle in return. There is another kind of ornament peculiar to the men, and that is, the bladder of any wild beast they have killed, which is blown up, and fastened to the hair as a trophy of their valour. Both sexes powder themselves with a dust they call bachu; and the women spot their faces with a red earth or stone (as ours do with black patches) which is thought to add to their beauty, by the natives; but, in the eyes of Europeans, renders them more frightful and shocking than they are naturally. But as part of their dress, we ought to have mentioned, in the first place, the custom of daubing their bodies, and the inside of their caps and mantles, with grease and foot. Soon after their children are born, they lay them in the sun, or by the fire, and rub them over with fat or butter, mixed with foot, to render them of a deeper black, it is said; for they are naturally tawny: and this they continue to do almost every day of their lives, after they are grown up, not only to increase their beauty, but to render their limbs supple and pliable. As some nations pour oil upon their heads and bodies, so these people make use of melted fat: you cannot make them a more acceptable present than the fat or scum of the pot that meat is boiled in, to anoint themselves.

Nor are the Hottentots more cleanly in their diet than in their dress; for they choose the guts and entrails of cattle and of some wild beasts (with very little cleaning), rather than the rest of the flesh, and eat their meat half boiled or broiled; but their principal food consists of roots, herbs, fruits or milk: they seldom kill any of those cattle, unless at a festival; they only feed on such as die of themselves, either of diseases or old age, or on what they take in hunting; and, when they are hard put to it, they will eat the raw leather that is wound about the womens legs, and even soles of shoes; and, as their mantles are always well stocked with lice of an unusual size, they are not ashamed to sit down in the public streets at the cape, pull off the lice, and eat them. And we ought to have remembered, that they boil their meat in the blood of beasts when they have any of it. They rather devour their meat than eat it, pulling it to pieces with their teeth and hands, discovering a canine appetite and fierceness: they abstain, however, from swines-flesh, and some other kinds of meat, and from fish that have no scales, as religiously as ever the Jews did. And here it may not be improper to say something of the management of their milk and butter: they never strain their milk, but drink it with all the hairs and nastiness with which it is mixed in the milking by the Hottentot women. When they make butter of it, they put it into some skin made in the form of a soldier's knapsack, the hairy side inwards; and then two of them taking hold of it, one at each end, they whirl and turn it round till it is converted into butter, which they put up for anointing themselves, their caps and mantles with, for they eat no butter; and the rest they sell to the Dutch, without clearing it from the hairs and dirt it contracts in the knapsack. The Hollanders, when they have it indeed, endeavour to separate the nastiness from it, and sell it to the shipping, that arrives there, frequently for butter of their own making; and some they eat themselves (but surely none but a Dutchman could eat Hottentot butter) and the dregs and dirt that is left they give to their slaves; which having been found to create diseases, the governor of the cape

sometimes prohibits their giving their slaves this stuff by public edict; which is not, however, much regarded. The butter-milk, without any manner of cleaning or straining, the Hottentots drink themselves; giving what they have to spare to their lambs and calves. Their usual drink is cow's milk or water, and the women sometimes drink ewe's milk; but this the men never touch: and it is observed, that the women are never suffered to eat with the men, or come near them, during the time of their menses.

Since the arrival of the Dutch among them, it appears that the Hottentots are very fond of wine, brandy, and other spirituous liquors: these, and the baubles already mentioned, the Hollanders truck for their cattle; and though a Hottentot will turn spit for a Dutchman half a day for a draught or two of four wine, yet do they never attempt to plant vineyards (as they see the Dutch often do) or think of making wine themselves.

We shall proceed, in the next place, to give an account of their towns and houses, or rather, their camps and tents.

Like the Tartars and Arabs, they remove their dwellings frequently for the convenience of water and fresh pasture: they encamp in a circle formed by twenty or thirty tents, and sometimes twice the number, contiguous to each other; within the area whereof they keep their lesser cattle in the night, and the larger on the outside of their camp: their tents, or, as some call them, houses, are made with slender poles, bent like an arch, and covered with mats or skins, and sometimes both: they are of an oval figure, the middle of the tent being about the height of a man, and decreasing gradually (the poles being shorter) towards each end, the lowest arch, which is the door or entrance, being about three feet high, as is the opposite arch at the other end; the longest diameter of the tent being about twelve or fourteen feet, and the shortest ten; and in the middle of the tent is a shallow hole about a yard diameter, in which they make their fire, and round which the whole family, consisting of nine or ten people of all ages and sexes, sit or lie night and day in such a smoak (when it is cold, or they are dressing of victuals) that it is impossible for an European to bear it, there being usually no vent for the smoak but the door, though some have seen a hole in the top of some of their huts, to let out the smoak, and give them light. Such a circle of tents or huts as has been described, is called by the Hottentots a kraal, and sometimes by the Europeans a town or village; but seems to be more properly a camp: for a town consists of more substantial buildings, and is seldom capable of being removed from one place to another; whereas these dwellings consist of nothing more than small tent-poles, covered with skins or mats, which are moveable, and carried away upon their baggage oxen whenever they remove with their herds to a distant pasture. As to the furniture of their tents; they consist of little more than their mantles which they lie on, some other skins of wild beasts they have killed or purchased, an earthen pot they boil their meat in, their arms, and perhaps some other trivial utensils. The only domestick animals they keep, are dogs, as ugly in their kind as their masters, but exceeding useful to them in driving and defending their cattle.

The Hottentots are agreed by all to be the laziest generation under the sun: they will rather starve, or eat dried skins, or shoe soles at home, than hunt for their food; and yet, when they apply themselves to the chase, or any other exercise, no people are more active and dexterous than the Hottentots; and they serve the Europeans often with the greatest fidelity and application, when they contract to serve them for wages: they are also exceeding generous and hospitable; they will scarce eat a piece of venison, or a dish of fish they have caught, or drink their beloved drams alone, but call in their neighbours to partake with them as far as it will go.

Concerning their government, people agree, that every nation has its king or chief, called konquer, whose authority devolves upon him by hereditary succession; and that they do not pretend to elect their respective

sovereigns. That this chief has the power of making peace and war, and presides in all their councils and courts of justice: but then his authority is said to be limited; and that he can determine nothing without the consent of the captains of the several kraals, who seem to be the Hottentot senate. The captain of every kraal, whose office is hereditary also, is their leader in time of war, and chief magistrate of his kraal in time of peace; and, with the head of every family, determines all civil and criminal causes within the kraal; only such differences as happen between one kraal and another, and matters of state, are determined by the king and senate. The Dutch, since their arrival at the cape, have presented the king, or chief of every nation of the Hottentots in alliance with them, with a brass crown; and the captains of each kraal with a brass-headed cane, which are now the badges of their respective offices; formerly they were distinguished only by finer skins, and a greater variety of beads and glittering trifles. In their councils their king sits on his heels in the center, and the captains of the kraals sit in like manner round about him. At his accession, it is said, he promises to observe their national customs; and gives them an entertainment, killing an ox, and two or three sheep, upon the occasion; on which he feasts his captains, but their wives are only entertained with the broth: but then the next day, we are told, her Hottentot majesty treats the ladies, and their husbands are put off in like manner with the soup.

The captain of each kraal also, at his accession, engages to observe the customs of his kraal, and makes an entertainment for the men, as his lady does the next day for the women; and, though these people shew their chiefs great respect, they allow neither their king or inferior magistrates any revenue; they subsist, as other families do, upon their stock of cattle, and what they take in hunting.

Having no notion of writing or letters, they can have no written laws; but there are some antient customs, from which they scarce ever deviate. Murder, adultery and robbery, they constantly punish with death; and, if a person is suspected of any of these crimes, the whole kraal join in seizing and securing him; but the guilty person sometimes makes his escape to the mountains, where robbers and criminals like himself, secure themselves from justice, and frequently plunder the neighbouring country; for no other kraal or nation of Hottentots will entertain a stranger, unless he is known to them, and can give a good reason for leaving his own kraal. If the offender is apprehended, the captain assembles the people of his kraal in a day or two; who, making a ring, and sitting down upon their heels, the criminal is placed in the center of them: the witnesses on both sides are heard, and the party suffered to make his defence: after which, the case being considered, the captain collects the suffrages of the judges; and, if a majority condemn him, the prisoner is executed on the spot. The captain first strikes him with a truncheon he carries in his hand, and then the rest of the judges fall upon him and drub him to death: then wrapping up the corpse in his krossie or mantle, it is carried to some place distant from the kraal, where they bury it. In civil cases also, the cause is determined by a majority of voices, and satisfaction immediately ordered to the injured person, out of the goods of the person that appears to be in the wrong. There is no appeal to any other court: the king and his council, consisting of the captains of the kraals, never interpose unless in matters that concern the public, or where the kraals are at variance. To which we may add, that the Hottentot's cattle and personal estate descend to his eldest son: he cannot disinherit him, or give his effects to his other children; but, as for property in lands, or any certain real estate, no man has any; the whole country is but one common, where they feed their cattle promiscuously, moving from place to place, to find water or fresh pasture as necessity requires. Even the several nations have no stated bounds; but use such tracts of land as their ancestors did before them: it is true, their respective limits sometimes create great differences

ferences between the several nations, and occasion bloody wars; which brings us now to treat of their arms, and the arts and stratagems they use in war.

The arms of a Hottentot are, 1. His lance, which resembles a half-pike, sometimes thrown, and used as a missile weapon; and at others, serves to push with in close fight, the head or spear whereof is poisoned. 2. His bow and arrows, the arrows bearded and poisoned likewise, when they engage an enemy or wild beast they do not intend for food. Their bows are made of iron, or olive-wood; the string, of the sinews or guts of some animal: the quiver is a long narrow case, made of the skin of an elephant, elk, or ox, and slung at their backs, as soldiers sling their knapsacks. 3. A dart of a foot long, which they throw exceeding true, scarce ever missing the mark they aim at, though it is not above the breadth of half a crown; these also are poisoned, when they engage an enemy or a wild beast that is not to be eaten: and lastly, when they have spent the rest of their missile weapons, they have recourse to stones, seldom making a discharge in vain; and, what is most remarkable in their shooting or throwing arrows, darts, or stones, they never stand still, but are all the while skipping and jumping from one side to the other, possibly to avoid the stones and darts of the enemy. They are all foot, and never engage on horseback; but have disciplined bulls or oxen taught to run upon the enemy, and to toss and disorder them; which these creatures will do with the utmost fury on the word of command, not regarding the weapons that are thrown at them: for though the Hottentots have numbers of large elephants in their country, they have not yet learned the art of taming them, or training them up to war, as the military men in the East Indies do. Every able bodied man is a soldier, and possessed of a set of such arms as has been described; and on the summons of his prince, appears at the rendezvous with all imaginable alacrity and contempt of danger, and every man maintains himself while the expedition lasts. As their officers, civil and military, have no pay, so neither do the private men expect any; a sense of honour, and the public good, are the sole motives for hazarding their lives in their country's service.

The Hottentots, in war, have very little conception of discipline, nor indeed is it possible they should; for the only method of raising an army, is, for the kraal captains to order the people to follow them; the only method of maintaining one, is by hunting as they march: and the only way of deciding a dispute between two nations, is, by fighting one battle; the success of which determines the whole affair. In an engagement, they attack with an hideous yell, fight in great confusion, and put more confidence in their war oxen than their own skill: for, as we have hinted above, these animals, when trained to the business, are better disciplined and much more formidable, than the Hottentots themselves. The principal inducements to their entering into a war at any time, is the preservation of their territories. As they have no land marks or written treaties to adjust the exact bounds of every nation, they frequently disagree about the limits of their respective countries; and, when any neighbouring nation grazes their cattle upon a spot of ground another claims, satisfaction is immediately demanded; and, if it be not given, they make reprisals, and have recourse to arms. But this is not the only occasion of wars amongst the Hottentots: they are not always that chaste and virtuous people Mr. Kolben has represented them; some tempting Helen (for Hottentots possibly may appear amiable in one another's eyes, with all the greafe and carrion they are clothed with) has snitten a neighbouring chief, perhaps, who prevails on his people to assist him in the rape of the desired female; and this frequently sets their tribes together by the ears. The stealing each others cattle is another cause of deadly strife; for though each kraal punishes theft among themselves with death, yet it is looked upon as an heroic act to rob those of another nation; at least the body of the people are so backward in giving up the offender, that they frequently come to blows upon it.

When they march into the field, every man follows his particular captain, the chief of his kraal: they observe little order; neither do they take the precaution of throwing up trenches to defend themselves: and what is still more surprising, have no fields to defend themselves against missile weapons, though some say they will ward off a lance or dart, and even a stone, with a little truncheon about a foot long, which they carry in their hand. The several companies advance to the charge, at the command of their chief; and, when those in the front have shot one flight of arrows, they retreat and make room for those in the rear; and, when they have discharged, the former advance again, and thus alternately they continue till they have spent all their missile weapons, and then they have recourse to stones, unless they are first broken and dispersed by a troop of bulls; for the wise chiefs and generals of each side, according to the European practice, remaining on an eminence in the rear, to observe the fortune of the day, when they observe their people are hard pressed, give the word of command to their corps de reserve of bulls, who break into the body of the enemy, and generally bring all into confusion; and that side that preserves their order best, on this furious attack of these bulls of Basan, are sure to be victorious. The skill of the general seems to be chiefly in managing his bulls; who never charge each other, but spend their whole rage upon the men, who have, it seems, no dogs of English breed to play against them, or this stratagem would be of little service: but we should have observed, that as the battle always begins with horrid cries and noise, which perhaps supplies the place of drums and trumpets; so the victors insult with no less noise over the conquered enemy, killing all that fall into their hands: but they seldom fight more than one battle, some neighbouring power usually interposing to make up the quarrel; and of late the Dutch perform this good office, between such nations as lie near their settlements. From their wars with each other, we naturally proceed to their wars with wild beasts, with which their country abounds more than any other; these people, it seems, esteem it a much greater honour to have killed one of these foes to mankind, than an enemy of their own species.

Instances are not wanting of a Hottentot's engaging singly with the fiercest wild beasts, and killing them; but usually the whole kraal or village assemble, when a wild beast is discovered in their neighbourhood, and, dividing themselves in small parties, endeavour to surround him. Having found their enemy, they usually set up a great cry, at which the frightened animal endeavours to break through and escape them: if it prove to be a rhinoceros, an elk, or elephant, they throw their lances at him, darts and arrows being too weak to pierce through their thick hides: if the beast be not killed at the first discharge, they repeat the attack, and load him with their spears; and, as he runs with all his rage at the persons who wound him, those in his rear follow him close, and ply him with their spears, on whom he turns again, but is overpowered by his enemies, who constantly return to the charge, when his back is towards them, and scarce ever fail of bringing the creature down, before he has taken his revenge on any of them. How hazardous soever such an engagement may appear to an European, these people make it their sport; and have this advantage, that they are exceeding swift of foot, and scarce ever miss the mark they aim at with their spears: if one of them is hard pressed by the brute, he is sure to be relieved by his companions, who never quit the field till the beast is killed, or makes his escape: though they sometimes dexterously avoid the adversary, they immediately return to the charge, subduing the fiercest either by stratagem or force. When attacking a lion, a leopard, or a tyger, their darts and arrows are of service to them; and therefore they begin the engagement at a greater distance, than when they charge an elephant or rhinoceros; and the creature has a wood of darts and arrows upon his back, before he can approach his enemies, which make him fret and rage and fly at them with

with the greatest fury; but those he attacks, nimbly avoid his paws, while others pursue him, and finish the conquest with their spears. Sometimes a lion takes to his heels, with abundance of poisoned darts and arrows in his flesh: but, the poison beginning to operate, he soon falls, and becomes a prey to those he would have preyed upon. The elephant, the rhinoceros, and the elk, are frequently taken in traps and pitfalls, without any manner of hazard. The elephants are observed to go in great companies to water, following in a file one after another, and usually take the same road till they are disturbed: the Hottentots therefore dig pits in their paths, about eight feet deep, and four and five over; in which they fix sharp stakes pointed with iron, and then cover the pit with small sticks and turf, so as it is not discernable: and as these animals usually keep in one track, frequently one or other of them falls in with his fore feet into the pit, and the stake pierces his body; the more he struggles, the deeper the weight of his monstrous body fixes him on the stake. When the rest of the herd observe the misfortune of their companion, and find he cannot disengage himself, they immediately abandon him: whereupon the Hottentots, who lie concealed, in expectation of the success of their stratagem, approach the wounded beast, stab him with their spears, and cut his largest veins, so that he soon expires; whereupon they cut him to pieces, and, carrying the flesh home, feast upon it as long as it lasts. His teeth they make into rings for their arms, and, when they have any ivory to spare, dispose of it to the Europeans. The rhinoceros and elk are frequently taken in pitfalls, as the elephants are. The Hottentot, who kills any of these, or a lion, leopard, or tyger, singly, has the highest honour conferred upon him, and several privileges, which belong only to such intrepid heroes. At his return from this hazardous and important service, the men of the kraal depute one of the seniors to congratulate him on his victory, and desire that he will honour them with his presence; whereupon he follows the old deputy to the assembly, whom he finds, according to custom, sitting upon their heels in a circle; and, a mat of distinction being laid for him in the center, he sets himself down upon it: after which the old deputy urines plentifully upon him, which the hero rubs in with great eagerness, having first scratched the grease off his skin with his nails; the deputy all this while pronouncing some words unintelligible to any but themselves. After this, they light a pipe of tobacco, which they smoke and hand one to another till there remain nothing but ashes in the pipe, and these the old deputy strews over the gallant man, who rubs them in as they fall upon him, not suffering the least dust to be lost. After which the neighbours having severally congratulated him on his advancement to the high honour, they disperse, and go to their respective tents. The conqueror, afterwards, fastens the bladder of the furious beast he has killed to his hair, which he ever after wears as a badge of his knight-hood; and is from that time esteemed by every one a brave man, and a benefactor to his country. When retired to his tent, his neighbours seem to vie which of them shall oblige him most, and are, for the next three days, continually sending him one delicious morsel or other; nor do they call upon him to perform duty during that time, but suffer him to indulge his ease: but, what is still more unaccountable, his wife, or wives, (for he may have more than one) are not allowed to come near him for three days after this honour is conferred on him; but they are forced to ramble about the fields, and to keep to a spare diet, lest they should, as Mr. Kolben surmises, tempt the husbands to their embraces: but on the third day in the evening, we are told the women return to the tent, are received with the utmost joy and tenderness; mutual congratulations pass between them; a fat sheep is killed, and their neighbours invited to the feast, where the prowess of the hero, and the honour he has obtained, are the chief subject of their conversation.

There is scarce any wild beast, but the flesh is good eating, if it be not killed with poisonous weapons; but

the tyger is the most delicious morsel; and as the whole kraal partake of the feast, the person who kills him meets with a double share of praise, as he both rids the country of an enemy, and pleases their palates. But to return to the field sports of the Hottentots: when they hunt a deer, a wild goat, or a hare, they go singly, or but two or three in company, armed only with a dart or two, and seldom miss the game they throw at: yet, as has been observed already, so long as they have any manner of food left, if it be but the raw hides of cattle, or shoe soles, they will hardly be persuaded to stir to get more; though it is true, when they apprehend their cattle in danger from wild beasts, no people are more active, or pursue the chase of them with greater alacrity and bravery. From hunting, we proceed to treat of their fishing; at which they are very expert; taking fish with angles, nets, and spears; and they get a certain fish, called rock-fish, particularly by groping the holes of the rocks near the shore, when the tide is out: these are mightily admired by the Europeans; but having no scales, the Hottentots will not eat them.

The manner of the Hottentot's swimming, is as particular as of his fishing; for he stands upright in the sea, and rather walks and treads the water, than swims upon it, his head, neck, and shoulders being quite above the waves, as well as his arms, and yet they move faster in the water than any European can; even in a storm, when the waves run high they will venture into the sea, rising and falling with the waves like a cork.

The next thing we shall notice, is the marriages of the Hottentots: and it seems, every young fellow has such regard to the advice of his father, (or rather the laws and customs of the country require it) that he always consults the old man before he enters into a treaty with his mistress, and if he approves the match, the father and son, in the first place, pay a visit to the father of the damsel, with whom having smoked, and talked of indifferent things for some time, the father of the lover opens the matter to the virgin's father, who having consulted his wife, returns an answer immediately to the proposal: if it be rejected, the lover and his father retire without more words; but if the offer be approved by the old folks, the damsel is called, and acquainted, that they have provided a husband for her; as she must submit to their determination, unless she can hold her lover at arms end, after a night's struggling; for we are told, that when the parents are agreed, the two young people are put together, and if the virgin loses her maidenhead, she must have the young fellow, though she be never so averse to the match: but then she is permitted to pinch and scratch, and defend herself as well as she can; and if she holds out till morning, the lover returns without his mistress, and makes no further attempts; but if he subdues her, she is his wife to all intents and purposes, without further ceremony; and the next day the man kills a fat ox, or more, according to his circumstances, for the wedding dinner, and the entertainment of their friends, who resort to them upon the occasion, bringing abundance of good wishes for the happiness of the married couple, as is usual among politer people. The ox is no sooner killed, but the company get each some of the fat, and grease themselves with it from head to foot, powdering themselves afterwards with buchu, and the women, to add to their charms, make red spots with oker, or red chalk, on their black faces. The entertainment being ready, the men form a circle in the area of the kraal (for a large company cannot fit within doors) and the women form another; the bridegroom sitting in the middle of the men's circle, and the bride in the center of her own sex. Then the priest enters the men's circle, and urines upon the bridegroom, which the young man rubs in very joyfully. He then goes to the ladies circle, where he does the bride the same favour. Then the old man goes from the bride to the bridegroom, till he has exhausted all his store. The priest then pronounces his benediction in these words: "That they may live long and happily together; that they may have a son before the end of the year; and that he may prove

prove a brave man, and an expert huntsman, and the like." After which, the meat is served up in earthen pots glazed with grease; and some of them having knives since the Europeans came amongst them, they divide their meat pretty decently; but more of them make use of their teeth and claws, pulling it to pieces, and eating it as voraciously as so many dogs, having no other plates or napkins than the stinking corners of the napkins they wear; and sea shells without handles usually serve them for spoons. When they have dined, a pipe is filled with tobacco, which they smoke all round, every one taking two or three whiffs, and then handing it to the next. It is singular, that though the Hottentots are immoderately fond of spirituous liquors, music and dancing, yet they do not drink the first, nor practise the latter at weddings.

The Hottentots allow of polygamy; but seldom have more than three wives at a time; and it seems it is death to marry or lie with a first or second cousin, or any near relation. A father seldom gives his son more than two or three cows, and as many sheep, upon his marriage, and with these he must make his way in the world; and we do not find they give more with their daughters than a cow, or a couple of sheep; but the latter are to be returned to the father, if the bride dies without having had any children: on the contrary, if she ever bore any children to her husband, the portion becomes his, even though the children are defunct. They do not leave their daughters, or younger sons, any thing when they die; but all the children depend upon the eldest brother, and are his servants, or rather slaves, when the father is dead, unless the elder brother infranchise them; nor has the mother any thing to subsist on, but what the eldest son allows her. There being no great fortunes among them, they match purely for love; an agreeable companion is all their greatest men aim at: their chiefs intermarry frequently with the poorest man's daughter; and a brave fellow, who has no fortune, does not despair of matching with the daughter of a prince. A widow, who marries a second time, is obliged to cut off a joint of one of her fingers; and so for every husband she marries after the first. Either man or woman may be divorced, on shewing sufficient cause before the captain and the rest of the kraal; the woman, however, must not marry again, though the man is allowed to marry, and have as many wives as he pleases at the same time. A young Hottentot never is master of a hut or tent till he marries, unless his father dies and leaves him one: therefore the first business the bride and bridegroom apply themselves to, after their marriage feast, is to erect a tent or hut of all new materials, in which work the woman has as great a share as the man; and this taking them up about a week's time, the new married couple are entertained in the mean time in the tents of some of their relations. When they resort to their new apartment, and come to keep house together, the wife seems to have much the greatest share of the trouble of it: she fodder the cattle, milks them, cuts out the firing, searches every morning for roots for their food, brings them home, and boils or broils them, while the drone of a husband lies indolently at home, and will scarce give himself the trouble of getting up to eat when the food is provided for him by the drudge his wife. The more wives he has, still the more indolent life he leads, the care of making provision for the family being thrown upon them. It is said he will, in his turn, attend his cattle in the field; but expects every one of his wives should do, at least, as much towards taking care of them as he does. He will also, sometimes, but very rarely go a hunting with the men of his kraal, and bring home a piece of venison, or a dish of fish; but this is not often; and if he is of any handicraft trade, he may work at it two or three hours in a week, and instruct his children in the art. He also takes upon him to sell his cattle, and purchase tobacco, and strong liquors of the Dutch, with necessary tools, beads and other ornaments, for which the Hottentots barter away their cattle: their wives are not permitted to intermeddle in the business of buying and selling, this being the sole pre-

No. 12.

prerogative of the man. When a woman brings a living son into the world, there is great rejoicing; but the first thing they do with the child, is to daub it all over with cow-dung; then they lay it before the fire, or in the sun, till the dung is dried; after which they rub it off, and wash the child with the juice of certain herbs, laying it in the sun, or before the fire again, till the liquor is dried in, after which they anoint the child from head to foot with butter, or sheep's fat melted, which is dried in as the juice was: and this custom of anointing their bodies with fat, they retain afterwards as long as they live. After the child has been thus smeared and greased, the mother gives it what name she thinks proper, which is usually the name of some wild beast, or domestic animal. When the woman is well again, and able to leave her hut, she rubs herself all over with cow-dung; and this filthy daubing is by these delicate people termed a purification. Being thus delightfully perfumed, and elegantly decorated with sheep's guts, she is permitted to go abroad, or to see company at home.

If the woman has twins, and they are girls, the man proposes it to the kraal, that he may expose one of them, either upon pretence of poverty, or that his wife has not milk for them both; and this they usually indulge one another in; they do the same when they have a boy or girl; but always preserve the boys, though they happen to have two at a birth. The exposed child is carried to a distance from the kraal; and if they can find a cave or hole in the earth, that some wild beast has made, they put the child alive into it; and then having stopped up the mouth of the den with stones or earth, leave it there to starve: if they cannot meet such a cavity, they tie the infant to the lower bough of a tree, or leave it in some thicket of bushes, where it is frequently destroyed by wild beasts. They do not deal thus, however, as has been observed, by their male children: on the birth of a boy, they kill a bullock; and if they have twins, two bullocks; and make an entertainment for all the neighbourhood, who congratulate the parents on their good fortune; and, as with us, the greatest rejoicings are on the birth of the first son.

The males, at about ten years of age, are always deprived of their left testicle; the operation is performed with a dexterity that would surprize an European surgeon, and bad consequences are seldom or never known to ensue. A sheep is killed, and great rejoicings are made upon the occasion; but it is to be observed, that the men devour all the meat, and allow the women nothing but the broth. The reason of this absurd custom of mutilating their male youth is unknown: some of the Hottentots say, it is to make them run swift; but the greatest part of these people give their general reason, which they use upon all occasions, when they are unable to account for any of their absurd practices; namely, That it is the Hottentot custom; and has been practised by their ancestors time immemorial. At the age of eighteen, the male Hottentots, being deemed men, are admitted into male society: the men of the village (if it may be so called) squat down, and form a circle, as is usual upon most public occasions, the youth squats down without the circle, at some distance. The oldest man of the kraal then rises from the circle, and, having obtained the general consent for the admission of a new member, he goes to the youth, acquaints him with the determination of the men of the kraal, and concludes his harangue with some verses, which admonish him to behave like a man for the future. The youth being then daubed with foot and fat, and well sprinkled with urine, is congratulated by the company in general in a kind of chorus, which contains the following wishes: that good fortune may attend him, that he may live long, and thrive daily; that he may soon have a beard, and many children; till it is universally allowed he is a useful man to the nation. A feast concludes the ceremony; but the youth himself is not permitted to participate of any part thereof till all the rest are served. Having been thus admitted into male society, it is expected that he should behave ill to

2 C

women

women in general, and to his mother in particular, in order to evince his contempt of every thing feminine. Indeed it is usual for a youth as soon as admitted, to go to his mother's hut, and cudgel her heartily, for which he is highly applauded by the whole kraal; and even the suffering parent herself admires him for his spirit, and protests that the blows do not give her so much pain, as the thoughts of having brought such a mettlesome son into the world afford her pleasure. The more ill treatment he gives his mother, the more esteem he obtains; and every time he strikes her she is in the highest raptures, and thanks providence for having blessed her with such a spirited child. So egregiously will custom counteract the very dictates of nature, and impose upon the understanding of the ignorant.

It may be proper now to say something of those officers amongst them, which the Europeans generally denominate their priests. These persons are called *surri* or master, and are elected by every kraal: they are the men who perform the ceremony of making water at their weddings, and other festivals; the *surri* also is the person who extracts the left testicle from the young males at eight years of age; for all which he has no stated revenue, but a present now and then of a calf or a lamb, and makes one at all their entertainments. Every kraal also has its physician, as well as its priest, who are persons that have some skill in physic and surgery, and particularly in the virtues of salutary herbs: these also are chosen by a majority of voices, and make it their business to look after the people's health: but have no other reward neither for their pains, than voluntary presents. And such is the opinion of the Hottentots of these physicians, that, if they cannot effect a cure, they conclude they are certainly bewitched; as the doctor himself also never fails to give out: whereupon application is made to some pretended conjurer for relief; and if the patient happens to recover, it gives the cunning man, as we call him, a mighty reputation. The physician and surgeon, as has been hinted, is the same person; and though these gentlemen scarce ever saw a body dissected, it is said, they have pretty good notions of anatomy: they cup, bleed, make amputations, and restore dislocated limbs, with great dexterity: cholicks and pains in the stomach they relieve by cupping. Their cup is an horn of an ox, the edges cut very smooth: the doctor, having sucked the part where the pain lies, claps on the cup; and, after it has remained some time, till he thinks the part is insensible, he pulls off the horn-cup, and makes two or three incisions, half an inch in length, with a common knife, having no other instrument: after which, he applies the cup again, which falls off when it is full of blood, but the patient, it is said, suffers great pain in the operation. If the pain removes to another part, they rub it with hot fat; and, if that does not ease the pain, they use the cup again on the part last affected; and, if the second cupping does not relieve the patient, they give him inward medicines, being infusions or powders of certain dried roots and herbs. They let blood in plethories and indispositions of that kind, having no other instrument than a common knife; and, if bleeding will not effect the cure, they give the patient physic. For head-achs, which they are pretty much subject to in calm weather, they shave their heads in furrows, as they do when they are in mourning; but a brisk gale of wind usually carries off the head-ach, without any other application; and this they do not often want at the cape. They seldom make any other amputations, than of the fingers of such women as marry a second time, or oftner: and, in this case, they bind the joint below that which is to be cut off very tight, with a dried sinew, and then cut off the joint at once with a knife, stopping the blood with the juice of myrrh-leaves; after which, they wrap up the finger in some healing herbs, and never any part of the finger receives any hurt beyond the amputation. They have little or no skill in setting fractured limbs; but are pretty dexterous at restoring of dislocations.

The Hottentot physician, in case he meets with a foul stomach, gives the juice of aloe leaves; and, if one dose

will not do, repeats it two or three days; and, for any inward ail, they give chiefly the powders, or infusions of wild sage, wild figs and fig leaves, buchu, garlic or fennel: but, whatever the disease be, it seems the patient never fails to sacrifice a bullock, or a sheep, upon his recovery.

The Hottentots are exceedingly superstitious, and fond of divination. In order to know the fate of a sick person, they slay a sheep alive; after having its skin intirely taken off, if the poor animal is able to get up and run away, it is deemed a propitious omen; but, on the contrary, if the excruciating pain kills it, they imagine that the patient will certainly die, and accordingly give him up intirely to nature, without taking any further care of him.

Whatever they believe of departed souls, they have no notion either of heaven or hell, or of a state of rewards or punishments; this is evident from the behaviour of a dying Hottentot, and those about him; neither he nor his friends offer up any prayers to their gods for the salvation of his soul; or even mention the state of departed souls, or their apprehensions of his being happy or miserable after death: however, they, set up terrible howlings and shriekings, when the sick man is in his last agonies; and yet these very people are frequently guilty of murdering their antient parents, as well as their innocent children; for when the father of a family, is become perfectly useless and superannuated he is obliged to assign over his stock of cattle, and every thing else he has in the world, to his eldest son; and in default of sons, to his next heir male: after which, the heir erects a tent or hut in some unfrequented place, a good distance from the kraal or camp he belongs to; and, having assembled the men of the kraal, acquaints them with the condition of his superannuated relation, and desires their consent to expose him in the distant hut; to which the kraal scarce ever refuse their consent. Whereupon a day being appointed to carry the old man to the solitary tent, the heir kills an ox, and two or three sheep, and invites the whole village to feast and be merry with him; and at the end of the entertainment, all the neighbourhood come and take a formal leave of the old wretch, thus condemned to be starved or devoured by wild beasts: then the unfortunate creature is laid upon one of their carriage oxen, and carried to his last home, attended to the place, where he is to be buried alive by most of his neighbours. The old man being taken down, and set in the middle of the hut provided for him, the company return to their kraal, and he never sees the face of a human creature afterwards; they never so much as enquire whether he was starved to death, or devoured by wild beasts: he is no more thought of, than if he had never been. In the same manner they deal with a superannuated mother; only as she has nothing she can call her own, she has not the trouble of assigning her effects to her son. Whenever the Hottentots are upbraided with this unparalleled piece of barbarity, they reply, it would be a much greater cruelty to suffer an old creature to languish out a miserable life, and to be many years a dying, than to make this quick dispatch with them; and that it is out of their extreme tenderness they put an end to the lives of these old wretches; all the arguments in the world against the inhumanity of the custom, can make no impression on them; and, indeed, as long as the Dutch have resided at the cape, they have not been able to break them of one single custom, or prevail with them to alter any part of their conduct, how barbarous or absurd soever: and, it seems, the captain of a kraal is not exempted from seeing his funeral solemnized in this manner, while he is alive, if he happens to become useless. And this leads us to treat of such funerals as are solemnized after the person is really dead.

The sick man, having resigned his breath, is immediately bundled up, neck and heels together, in his sheep-skin mantle, exceeding close, so that no part of the corpse appears: then the captain of the kraal with some of the seniors, search the neighbouring country for some cavity in a rock, or the den of a wild beast, to bury it in, never digging a grave, if they can find

one of these within a moderate distance. After which, the whole kraal, men and women, prepare to attend the corpse, seldom permitting it to remain above ground more than six hours. When all things are ready, all the neighbourhood assemble before the door of the deceased, the men sitting down on their heels in one circle, and resting their elbows on their knees (their usual posture) as the women do in another: here they clap their hands, and howl, crying, Bo, bo, bo! (i. e. father) lamenting their loss. The corpse being then brought out on that side the tent, where the person died, and not at the door, the bearers carry him in their arms to the grave, the men and women follow it in different parties, but without any manner of order, crying all the way, Bo, bo, bo! and wringing their hands, and performing a thousand ridiculous gestures and grimaces, which is frequently the subject of the Dutchmen's mirth; it being impossible, it is said, to forbear laughing at the antic tricks they shew on such an occasion. Having put the corpse into the cavity prepared for it, they stop up the mouth of it with ant hills, stones, and pieces of wood, believing the ants will feed on the corpse, and soon consume it. The grave being stopped up, the men and women rendezvous again before the tent of the deceased, where they repeat their howling, and frequently call upon the name of their departed friend: after which two of the oldest men get up; and one of them going into the circle of the men, and the other into the circle of the women, urine upon every one of the company; and, where the kraals are so very large, that two cannot find water enough for this ceremony, they double or treble the number. Then the old men go into the tent of the deceased; and, having taken up some ashes from the fire-place, they sprinkle them upon the bodies of the people, blessing them as they go: and, if the deceased was a person of distinction, this is acted over again several days. But we should have remembered, that the ceremony always concludes with an entertainment. If the deceased had any cattle, a sheep is killed on the occasion; and the caul being powdered with buchu, is tied about the heir's neck, who is forced to wear it while it rots off, which is no great penance, all stinks being perfumes to a Hottentot. All the relations also wear the cauls of sheep about their necks; which it seems is their mourning, unless the children of the deceased are so poor, that they cannot kill a sheep; and then they shave their heads in furrows of about an inch broad, leaving the hair on of the same breadth between every furrow.

It is not an easy matter to come at a Hottentot's religious notions; he is sparing of his words, and laconic in his answers upon all occasions; but when religious topics are introduced, he generally conceals his sentiments in silence. Some on this account have doubted whether the Hottentots have any religion at all: but the most intelligent among the Dutch at the cape positively affirm, that they believe in a Supreme Being, whom they stile Gounya Tequoa, or God of gods, and fancy that his place of residence is beyond the moon. They allow that Gounya Taquoa is a humane benevolent being, yet they have no mode of worshipping him; for which they give this reason, "That he cursed their first parents for having greatly offended him, on which account their posterity have never from that time paid him adoration." They believe that the moon is an inferior visible god, and the representative of the high and invisible: that she has the direction of the weather; and therefore they pray to her when it is unreasonable. They never fail to assemble and worship this planet at the new and full moon, let the weather be never so bad; and though they distort their bodies, grin and put on very frightful looks, crying and howling in a terrible manner, yet they have some expressions that shew their veneration and dependance on this inferior deity; as, 'Mutshi Atze, I salute you; you are welcome: Cheraqua kaka chozi Ounqua, grant us pasture for our cattle and plenty of milk.' These and other prayers to the moon they repeat, frequently dancing and clapping their hands all the while; and, at the end of every dance, crying, Ho, ho, ho, ho! raising and falling their voices, and using

abundance of odd gestures, that appear ridiculous to European spectators; and which no doubt, made them at first, before they knew any thing of their language, conclude, that this could not be the effect of devotion, especially when the people themselves told them, it was not an act of religion, but only intended for their diversion. They continue thus shouting, singing and dancing, with prostrations on the earth, the whole night, and even part of the next day, with some short intervals, never resting, unless they are quite spent with the violence of the action; and then they squat down upon their heels, holding their heads between their hands, and resting their elbows on their knees; and, after a little time, they start up again, and falling to singing and dancing in a circle as before, with all their might.

The Hottentots also adore a fly about the bigness of a hornet, called by some the gold beetle: whenever they see this insect approach their kraal, they all assemble about it, and sing and dance round it while it remains there, strewing over it the powder of buchu, by botanists called spiræam; which when it is dried and pulverized, they always powder themselves with it at festivals. They strew the same powder also over the tops of their tents, and over the whole area of the kraal, as a testimony of their veneration for the adored fly. They sacrifice also two sheep as a thanksgiving for the favour shewn their kraal, believing they shall certainly prosper after such a visit: and, if this insect happens to light upon a tent, they look upon the owner of it for the future as a saint, and pay him more than usual respect. The best ox of the kraal also is immediately sacrificed, to testify their gratitude to the little winged deity, and to honour the saint he has been pleased thus to distinguish: to whom the entrails of the beast, the choicest morsel in their opinion, with the fat and the caul is presented; and the caul being twitted like a rope, the saint ever after wears it like a collar about his neck day and night, till it putrifies and rots off; and the saint only feasts upon the entrails of the beast, while the rest of the kraal feed upon the joints, that are not in so high esteem among them: with the fat of the sacrifice also the saint anoints his body from time to time, till it is all spent; and, if the fly lights upon a woman she is no less revered by the neighbourhood, and entitled to the like privileges. It is scarce possible to express the agonies the Hottentots are in, if any European attempts to take or kill one of these insects, as the Dutch will sometimes seem to attempt, to put them in a fright: they will beg and pray, and fall prostrate on the ground, to procure the liberty of this little creature, if it falls into a Dutchman's hands; they are on such an occasion, in no less consternation than the Indians near fort St. George, when the kite, with a white head, which they worship, is in danger. If a soldier takes one of these alive, and threatens to wring the neck of it off, the Indians will gather in crowds about him, and immediately collect the value of a shilling or two, to purchase the liberty of the captive bird they adore. But to return to the Hottentots: they imagine if this little deity should be killed, all the cattle would die of diseases, or be destroyed by wild beasts; and they themselves should be the most miserable of men, and look upon that kraal to be doomed to some imminent misfortune, where this animal seldom appears.

The Hollanders have sent several reverend divines to the cape as missionaries, who have spared no pains to bring the Hottentots off from their idolatry, and induce them to embrace Christianity; even their covetousness and ambition have been applied to, and temporal rewards offered them, on condition of their being instructed in the principles of Christianity. But no motives whatever, whether those relating to this or another state, have yet been able to make the least impression on any one of them: they hold fast and hug their ancient superstitions, and will hear of no other religion. The reason that they neither imitate the Europeans in their building, planting or cloathing, is because they imagine themselves to be religiously obliged to follow the customs of their ancestors; and that, if they should deviate from them in the least of these matters, it might

make way for a total change of their religion and manners, which they cannot think of without abhorrence. One of the Dutch governors at the cape bred up an Hottentot from his infancy, obliging him to follow the fashions and customs of the Europeans, to be taught several languages, and to be fully instructed in the principles of the Christian religion, cloathing him handsomely, and treating him, in all respects, as a person for whom he had a high esteem; and let him know, that he designed him for some beneficial and honourable employment. The governor afterwards sent him a voyage to Batavia, where he was employed, under the commissary his friend, for some time, till that gentleman died; and then he returned to the cape of Good Hope: but, having paid a visit to the Hottentots of his relations and acquaintance, he threw off all his fine cloaths, bundled them up, and laid them at the governor's feet, and desired he would give him leave to renounce his Christianity, and live and die in the religion and customs of his ancestors; only begged the governor would give him leave to keep the hanger and collar he wore for his sake; which while the governor was deliberating with himself upon, scarce believing the fellow to be in earnest, the young Hottentot took the opportunity of running away, and never came near the cape afterwards, thinking himself extremely happy that he had exchanged his European cloaths for a sheep skin and the rest of the Hottentots dress and ornaments: the English East India company, we are informed, made the like experiment, bringing over two of that nation hither, whom they cloathed decently after the European manner, and used them, in all respects, with the greatest goodness and gentleness, hoping, by that means, to be better informed of the condition of their country, and whether it might be worth the while to make a settlement there: but the two Hottentots only learnt English enough to bewail their misfortune in being brought from their country and their friends; and, after two years trial of them, being again set on shore at the cape, they immediately stripped off their European cloaths, and, having taken up the sheep skin mantle again, rejoiced beyond measure for their happy escape from the English.

The poor Hottentots sometimes employ themselves in making arms, viz. bows and arrows, lances and darts, bartering them with the rich for cattle, to begin the world with: others get elephants teeth, and what they do not use in making rings and ornaments for themselves, are generally disposed of, it is thought, to the Portuguese and other Europeans, who touch at Terra de Natal, and other parts of the eastern or western coast. The Hottentots sell very few teeth to the Dutch; though it is manifest they kill abundance of elephants: they supply the Hollanders however with cattle, and take wine, brandy or tobacco, in return; and an ox may be purchased of them for a pound of tobacco, and a large sheep for half a pound. As to coin, the reader will conclude they have none; nor do they ever see any, unless some small pieces of money the Dutch sometimes give them for their wages at the cape; and it must not be forgot, that the Hottentots and abundance of ostrich's eggs in the sand, which they barter with the sea-faring men, that touch at the cape, for brandy and tobacco; every sailor almost being proud of bringing home one of these egg shells to his friends, after he has fried and eaten the yolk, which makes a large pancake, and is pretty good food, but rather of the strongest.

Their butchers are said to be great artists in their way, and to handle a knife as dexterously as an anatomist: having tied the hind and fore legs of a sheep, they throw the creature on his back, and with cords, two of them extend it to its full stretch, while a third rips it up; so that all the entrails appear: then, with one hand, he tears the guts from the carcase, and, with the other, stirs the blood, avoiding as much as he can the breaking any of the blood-vessels about the heart; so that the sheep is a long time a dying: in the mean time he gives the guts to another, who just rids them of the filth, and rinses them in water, and part of them are broiled and

eaten amongst them, before the sheep is well dead: having scooped the blood out of the body of the animal with their hands or sea shells, they cut the rest of the guts in small pieces, and stew them in the blood, which is the Hottentots favourite dish. An ox also is killed in the same barbarous manner; being thrown upon his back, and his legs extended with cords, he is ripped up, and his guts taken out first; in which cruel operation the beast is half an hour a dying: they separate the parts with great exactness, dividing the flesh, the bones, the membranes, muscles, veins, and arteries, and laying them in several parcels every thing entire. The bones also are taken out of the flesh, and laid together in such order, that they might be easily formed into an exact skeleton: these they boil by themselves, and get the marrow out of them, with which they anoint their bodies. Of the sheep skin, as has been observed already, they make a mantle, if it be large; but, if it is small, they cut it into thongs, to adorn their women's legs: and the hide of an ox serves either to cover their tents, or to make girts and straps of, with which they bind their baggage on their carriage oxen when they decamp; and, if they have no other use for their ox-hides, they lay them by, and eat them when they want other food.

They have another artificer, who is both selmonger and taylor: that is, he dresses skins after their way, and then makes them into mantles: he takes a sheep skin just flayed off, and, rubbing it well with fat, the skin becomes tough and smooth; and, if it be for one of his countrymen, he rubs it over also with fresh cow-dung, and lays it in the sun till it is dry: then he rubs it with fat and cow dung again; which he repeats several times, till it becomes perfectly black, and stinks so, that no European can bear it; and then, with a little shaping and sewing, it is a compleat mantle for a Hottentot: but, if it be dressed for a Dutchman, he only rubs the skin well with fat, which secures the wool from coming off. If he be to dress an ox's hide, he rubs the hairy side with wood ashes; then sprinkling it with water, rolls it up, and lays it a day or two in the sun; which expedients effectually bring off the hair; this skin is then well greased, stretched out, and dried again, when it is deemed good leather.

Their smiths do not only fashion their iron, but melt it from the ore: they find plenty of iron stones in several parts of their country; and having got a heap of these, they put them into a hole in the ground, heated and prepared for their purpose: then they make a fire over the stones, which they supply with fuel, and keep up till the iron melts; and then it runs into another hole, which they make for a receiver, a little lower than the first: as soon as the iron in the receiver is cold they break it to pieces with stones; and, heating the pieces again in other fires, beat them with stones, till they shape them into the heads of lances, darts, arrows, and bows, and such weapons as they use; for they scarce ever form any other utensils, but arms of this metal: they get the hardest flat stone, according to monsieur Vogel, and, laying the iron upon it, as upon an anvil, beat it with another round stone, which serves them for a hammer; then they grind it upon the flat stone, and polish it as nicely as any European artificer could do with all his tools: they have some copper ore too, which they melt in like manner; but they make only toys and ornaments for their dress of this metal: nor, indeed, do they ever work in iron, but when they want weapons. They would never labour, if their necessities did not sometimes compel them to it: but, when they do, no people work harder, or more indefatigably; for they never leave a piece of work, till they have finished it.

The ivory-turner makes the ivory rings that are worn ornamentally about the arms; and considering that his only tool is a common clasp knife, which he procures from the Dutch, the workmanship has great merit.

The potter or maker of earthen vessels is another art; but this, it seems, they are all dexterous at, every family making the pots and pans they want. For these
they

they use only the earth of ant-hills, clearing them of all sand and gravel; after which, they work it together with the bruised ant eggs, that are said to constitute an extraordinary cement. When they have moulded these materials into a kind of paste, they take as much of them as will make one of their pots, and fashion it by hand upon a flat stone, making it of the form of a Roman urn; then they smooth it within and without very carefully, not leaving the least roughness upon the surface; and, having dried it in the sun two or three days, they put the pot into a hole in the ground, and burn it, by making a fire over it; and, when they take it out, it appears perfectly black: every family also make their own mats, with which they cover their tents or huts; but this is chiefly the business of the women: they gather the flags and rushes by the river side, or weave or plat them into mats so closely, it is said, that neither the weather or light can penetrate them.

The last artificer we shall mention is the rope-maker, who has no better materials, than such flags and rushes as the mats are made of; and yet they appear almost as strong as those made of hemp: the Dutch, at the cape, buy and use them in ploughing, and in draught-carriages.

As to the way of travelling here, the natives all travel on foot, except the aged and infirm; and these are carried on their baggage oxen. As there are no inns or places for refreshment, the travelling Hottentot calls at the kraals in his way, where he meets with a hearty welcome from his countrymen, who endeavour to shew their hospitality to strangers, whether of their own country or of Europe. Such indeed is the general urbanity of these people, and their strict integrity when any confidence is placed in them, that when the Hollanders travel either on foot or horseback, if they cannot reach a European settlement, they also call at the kraals of the Hottentots, where they are complimented with a hut, and such provision as they have, or they may lie in the area of the kraal, in the open air, if they please, and the weather be good; and here they are secure, both from robbers and wild beasts; for the bushy banditti on the mountains are dangerous, as they give no quarter; but the Hottentot nations in general hold them in abhorrence, and unanimously concur in seizing and punishing them upon all occasions.

Their language is very inarticulate and defective; one word signifies several things, the definitive meaning being determined by the manner of pronouncing; and the pronunciation is so harsh and confused, that they seem to stammer in all they speak. Hence, though they are easily taught to understand other languages, they can seldom be brought to speak them with any degree of intelligibility.

We shall here subjoin a small Hottentot vocabulary, for the satisfaction of the curious; *khauna*, signifies a lamb; *kgou*, a goose; *bunqvaa*, trees; *knomm*, to hear; *quaqua*, a pheasant; *tkaka*, a whale; *horri*, beasts in general; *knabou*, a fowling piece; *qua-ara-ho*, a wild ox; *ounequa*, the arms; *quienkha*, to fall; *likhance*, a dog; *konkequa*, a captain; *quas*, the neck; *quan*, the heart; *kgoyes*, a buck or doe; *tikquoa*, a god; *komma*, a house; *khoa*, a cat, *kowkuri*, iron; *konkekerey*, a hen; *thoukou*, a dark night; *tkoume*, rice; *ghoudie*, a sheep; *toya*, the wind; *tkaa*, a valley; *tkaonoklau*, gunpowder; *kamkamma*, the earth; *quaouw*, thunder; *duckatere*, a duck; *kamma*, water; *quayha*, an ass; *naew*, the ears; *kirri*, a stick; *nombha*, the beard; *ka-a*, to drink; *duriesla*, an ox; *hek-kaa*, an ox of burden; *ounvie*, butter; *houteo*, a sea dog; *bikgua*, the head; *kamma*, a stag; *kouquil*, a pigeon; *anthuri*, to-morrow; *kou*, a tooth; *kha-mouna*, the devil; *hakqua*, a horse; *koo*, a son; *kammo*, a stream; *tika*, grass; *toqua*, a wolf; *koanqua*, the mouth; *khou*, a peacock; *gona*, a boy; *gois*, a girl; *khoakamma*, a baboon; *kerhanchou*, a star; *mu*, an eye; *tquassouw*, a tyger.

The Hottentots have only ten numerical terms, which they repeat twice to express the multiplication of the first term, and three times to express the re-multiplication of the latter. Their terms are: *q'kui*, one;

No. 12.

k'kam, two; *kouna*, three; *kakka*, four; *koo*, five; *nanni*, six; *houunko*, seven; *khifli*, eight; *khaffi*, nine; *ghifli*, ten.

Thus have we given a circumstantial and full account of the cape, its inhabitants, productions, and adjacent country; from whence the French, at Mauritius, are supplied by the Dutch with salted beef, biscuit, flour, and wine: the provisions for which the French contracted this year were five hundred thousand lb. weight of salt beef, four hundred thousand lb. of flour; four hundred thousand lb. of biscuit, and one thousand two hundred leaguers of wine. We have only to add to this account a few observations on the bay, and garrison. The former is large, safe, and exceeding convenient. It is indeed open to the N. W. winds, but they seldom blow hard; yet as they sometimes occasion a great sea, the ships moor N. E. and S. W. The S. E. winds blow frequently with great fury, but their direction being right out of the bay prevents them from being dangerous. For the convenience of landing and shipping goods, a wharf of wood is run out near the town, to a proper distance. Water is conveyed in pipes to this wharf, and many large boats and hoys are kept by the Company to carry stores and provisions to and from the shipping in the harbour. This bay is covered by a small fort on the E. side of the town, and close to the beach; and is also defended by several outworks and batteries extending along the shore, as well on this side of the town as the other; nevertheless they are by their situation exposed to the shipping, and in a manner defenceless against an enemy of any force by land. As to the garrison, this consists of eight hundred regular troops, besides militia of the country, in which last is comprehended every man able to bear arms. By signals they can alarm the country in a very short time, and when these are made, the militia is to repair immediately to their place of rendezvous in the town.

On Sunday, the 14th of April in the morning, we weighed, stood out of the bay, and anchored at five in the evening under Penguin, or Robin Island. Here we lay all night, and being prevented from sailing by the wind, the Captain dispatched a boat to the island for a few trifling articles, which we had omitted to take in at the Cape: when our people drew near the shore, they were warned by the Dutch not to land at their peril. At the same time six men, armed with muskets, paraded upon the beach. The commanding officer in the boat did not think it prudent to risk the lives of his men, on account of a few cabbages, and therefore returned without them to the ship. To this island the Dutch at the Cape banish such criminals as are not thought worthy of death, for a certain number of years, according to the nature of their crimes. They are employed as slaves in digging lime-stone, which though scarce upon the continent is here in great abundance. A Danish ship touched at this island, having been refused assistance at the Cape, and sending her boat on shore, overpowered the guard, and then took as many of the criminals as were necessary to navigate her home; for she had lost great part of her crew by sickness. To this incident we attributed our repulse; concluding, that the Dutch to prevent a similar rescue of their prisoners, had ordered their garrison at this place, not to suffer any boat of foreign nations to land the crew, and come ashore.

On Thursday the 25th, we put to sea, and about four o'clock in the afternoon died our master, Mr. Robert Molineux, a youth of good parts, but unhappily for his own self preservation too much addicted to intemperance, a habit we would caution all those who undertake long voyages to avoid, if they have any regard to their personal safety. We now continued our voyage without any other remarkable incident; and on Monday the 29th, we crossed our first meridian, having circumnavigated the globe from E. to W. and consequently lost a day, for which upon correcting our reckoning at Batavia, we made an allowance. On Monday the 1st of May, we came to anchor at break of day, before James's fort in the island of St. Helena; and as we

to refresh here, Mr. Banks employed his time in visiting the most remarkable places, and in surveying every object worthy of notice.

St. Helena is situated in the Atlantic ocean, in six degrees W. longitude, and sixteen S. latitude, almost in the midway between Africa and America, being twelve hundred miles distant from the former, and eighteen hundred from the latter. It was so named by the Portuguese, who discovered it on St. Helen's-day. This island is 36 miles long, 18 broad, and about 61 in circumference. It is the summit of an immense mountain rising out of the sea, and of a depth unfathomable at a small distance round it. It may be discerned at sea, at above twenty leagues distance, and looks like a castle in the middle of the ocean, whose natural walls are of that height, that there is no scaling them. The small valley called Chapel-valley, in a bay on the east side of it, is defended by a battery of forty or fifty great guns, planted even with the water; and the waves dashing perpetually on the shore, make it difficult landing even here. There is also one little creek besides, where two or three men may land at a time; but this is now defended by a battery of five or six guns, and rendered inaccessible. No anchorage is to be found any where about the island, but at Chapel-valley bay, and as the wind always sets from the S. E. if a ship overshoots the island ever so little, she cannot recover it again. The feat of volcanoes has been found to be the highest part of the countries in which they are found. Hecla is the highest hill in Iceland; and the pike of Teneriffe is known to be the covering of subterraneous fire. These are still burning: but there are other mountains which bear evident marks of fire that is now extinct: among these is St. Helena, where the inequalities of the ground, and its external surface, are evidently the effects of the sinking of the earth; and that this was caused by subterraneous fire, is equally manifest from the stones, for some of them, especially those in the bottom of the valleys, are burnt almost to cinders. This island, as the Endeavour approached it on the windward side, appeared like a rude heap of rocks, bounded by precipices of an amazing height, and consisting of a kind of stone, which shows not the least sign of vegetation: nor is it more promising upon a nearer view. Sailing along shore, we came near the huge cliffs, that seemed to overhang the ship. At length we opened Chapel-valley, which resemble a trench, and in this valley we discovered the town. The sides of it are as naked as the cliffs next the sea; but the bottom is slightly clothed with herbage. In its present cultivated state, such appeared the island to us; and the first hills must be passed, before the country displays its verdure, or any other marks of fertility.

In Chapel-valley, a little beyond the landing place, is a fort where the governor resides with the garrison; and the town stands just by the sea-side. The greater part of the houses are ill built. The church, which was originally a mean structure, is in ruins; and the market-place nearly in the same condition. The town consists of about forty or fifty buildings, constructed after the English fashion, whither the people of the island resort when any shipping appears, as well to assist in the defence of the island, as to entertain the seamen if they are friends: for the governor has always sentinels, on the highest part of the island, to the windward, who give notice of the approach of all shipping, and guns are thereupon fired, that every man may resort to his post. It is impossible for an enemy to approach by sea in the night time, and if discovered the day before, preparations are speedily made for his reception.

Notwithstanding the island appears a barren rock on every side, yet on the top it is covered with a fine layer of earth, producing grain, fruits, and herbs of various kinds; and the country after we ascended the rock, is diversified with rising hills and plains, plantations of fruit trees and kitchen gardens, among which the houses of the natives are interspersed, and in the open fields are herds of cattle grazing, some of which are fattened to supply the shipping, and the rest furnish the dairies

with milk, butter, and cheese. Hogs, goats, turkeys, and all manner of poultry also abound, and the seas are well stored with fish. But amidst all this affluence, the people have neither bread nor wine of their own growth; for though the soil is proper for wheat, yet the rats that harbour in the rocks, and cannot be destroyed, eat up all the seed, before the grain is well out of the ground; and though their vines flourish and produce them grapes enough, yet the latitude is too hot for making wine. This they have therefore from the Canaries, the Madeiras, or the Cape, as well as their flour and malt. Their very houses are some of them brought from Europe ready framed, there being no timber on the island, trees not taking deep root here on account of the rock that lies so near the surface; however, they have underwood enough for necessary uses. Besides grapes, they have plantains, bananas, figs, lemons, and such other fruits as hot countries usually produce. They also raise kidney beans, and some other kinds of pulse in their gardens; and the want of bread they supply with potatoes and yams.

In the year 1701, there were upon the island about two hundred families, most of them English, or descended from English parents. Every family has a house and plantation on the higher part of the island, where they look after their cattle, fruits, and kitchen garden. They scarce ever come down to the town, unless it be to church, or when the shipping arrives, when most of the houses in the valley are converted into punch-houses, or lodgings for their guests, to whom they sell their poultry, and other commodities; but they are not suffered to purchase any merchandize of the ships that touch here. Whatever they want of foreign growth or manufacture, they are obliged to buy at the company's warehouse, where twice every month, they may furnish themselves with brandy, European or Cape wines, Batavia arrack, malt, beer, sugar, tea, coffee, china, and japan-ware, linen, calicoes, chintz, muslins, ribbands, woollen-cloth and stuffs, and all manner of cloathing, for which they are allowed six months credit. Among the very few native productions of this island must be reckoned ebony, though the trees are now nearly extinct. Pieces of this wood are frequently found in the valleys of a fine black colour, and a hardness almost equal to iron; these pieces, however, are so short and crooked, that no use can be made of them. There are few insects here, but upon the tops of the highest ridges a species of snail is found, which has probably been there since the original creation of their kind. It is indeed very difficult to conceive how any thing not formed here, or brought hither by the diligence of man, could find its way to a place so severed from the rest of the world, by seas of immense extent.

The Portuguese, who discovered this island in 1502, stored it with hogs, goats, and poultry, and used to touch at it for water and fresh provisions in their return from India; but we do not find they ever planted a colony here; or, if they did, having deserted it afterwards, the English East-India Company took possession of the island A. D. 1600, and held it till 1673, without interruption, when the Dutch took it by surprise. However, the English, commanded by Capt. Munden, recovered it again within the space of a year, and took three Dutch East India ships that lay in the road at the same time. The Hollanders had fortified the landing place, and planted batteries of great guns to prevent a descent; but the English being acquainted with a small creek where only two men could go abreast, climbed up to the top of the rocks in the night time, and appearing next morning at the backs of the Dutch, they threw down their arms, and surrendered the island without striking a stroke: but, as we have before observed, this creek has been since fortified: so that there is now no place where an enemy can make a descent with any probability of success.

The affairs of the East-India Company are managed here by a governor, deputy-governor, and storehouse-keeper, who have certain settled salaries allowed, besides a public table, well furnished, to which all commanders,

manders, masters of ships, and eminent passengers are welcome. The natives sometimes call the result of their deliberations severe impositions; and though relief might perhaps be had from the company in England, yet the unavoidable delays in returning answers to addresses at that distance puts the aggrieved under great hardships; and on the other hand, was not the situation of this island very serviceable to our homeward-bound East-India ships, the constant trouble and expence would induce the company to abandon the island; for though it is furnished with the conveniences of life, the merchants find no other profitable commodities there. The masters of the plantations keep a great many blacks, who, upon severe treatment, hide themselves for two or three months together, keeping among the rocks by day, and roving at night for provisions: but they are generally discovered and taken.

The children and descendants of white people have not the least red in their cheeks, in all other places near the tropics; but the natives of St. Helena are remarkable for their ruddy complexions and robust constitutions. Their healthfulness may, in general, be ascribed to the following causes. They live on the top of a mountain always open to the sea breezes that constantly blow here: they are usually employed in the most healthful exercises of gardening and husbandry; the island is frequently refreshed with moderate cooling showers; and no noxious fens, nor salt marshes annoy them. They are used also to climb the steep hill between the town in Chapel-valley and their plantation; which hill is so steep, that, having a ladder in the middle of it, they call it Ladder-hill; and this cannot be avoided without going three or four miles about; so that they seldom want air or exercise, the great preservers of health. As to the genius and temper of these people, they seemed to us the most honest, the most inoffensive, and the most hospitable people we ever met with of English extraction, having scarce any tincture of avarice or ambition. We asked some of them, if they had no curiosity to see the rest of the world, and how they could confine themselves to so small a spot of earth, separated at such a distance from the rest of mankind? They replied, that they enjoyed the necessities of life in great plenty: they were neither parched with excessive heat, or pinched with cold: they lived in perfect security; in no danger of enemies, of robbers, wild beasts, or rigorous seasons; and were happy in the enjoyment of a continued state of health: that as there were no rich men among them (scarce any planter being worth more than a thousand dollars) so there were no poor in the island, no man being worth less than four hundred dollars, and consequently not obliged to undergo more labour than was necessary to keep him in health.

Our thoughts were now employed on returning to our native shore; and having sufficiently recruited our stores, on Saturday the 4th of May, we weighed, and sailed out of the road in company with the Portland man of war, and his convoy, consisting of twelve sail of East Indiamen. With this fleet we continued our course for England until Friday the 10th, when perceiving they out-sailed us, and consequently might make their port before us, Capt. Cook, for this reason, made the signal to speak with the Portland, upon which Capt. Elliot came on board the Endeavour; to whom a letter for the Admiralty was delivered, with a box, containing the common log books of the ship, and the journals of some of the officers. We did not lose sight of the fleet till Thursday the 23d, when they parted from us; and about one o'clock in the afternoon, we lost our first lieutenant, Mr. Hicks, an active, skilful, judicious, and useful officer. He died of a consumption, of which lingering disorder he discovered some symptoms when he left England; so that it may be truly

said, that he was dying the whole voyage; and his decline was very gradual till we arrived at Batavia, from whence to the time of his dissolution, the slow consuming disease gained strength daily. The whole ship's company attended the funeral rites, and in the evening we committed his body to the sea with the usual ceremonies. The next day the Captain appointed Mr. Charles Clerk, a young man, to act in the room of Mr. Hicks.

We now every day drew nearer our desired haven; but what must be the condition of our once good ship, the Endeavour, may easily be imagined, from a slight recollection of the hardships she had surmounted, and the dangers she had providentially escaped. At this time our rigging and sails were so weather-beaten, that every day something was giving way. However, we held on our course, without any material occurrence that might endanger our safety, till Monday the 10th of June, when, to our great joy, Nicholas Young, the boy who first discovered New Zealand, called out land from the mast head, which proved to be the Lizard. The next day, being Tuesday, the eleventh, we proceeded up the channel. On Wednesday the 12th, with the pleasing hopes of seeing our relatives and friends, exciting sensations not to be described by the pen of the most able writer, we passed Beachy Head. At noon, to our inexpressible joy we were a-breast of Dover; and about three o'clock, P. M. we came to an anchor in the Downs. When we landed at Deal, our ship's company indulged freely that mirth, and sociable jollity, common to all English sailors upon their return from a long voyage, who as readily forget hardships and dangers, as with alacrity and bravery they encounter them.

We cannot close this book without joining in that general censure, which has been justly bestowed on Dr. Hawkesworth, the late compiler of a former account of this voyage of the Endeavour. An infidel may imbibe what deistical chimeras may be best adapted to the gloomy temper of his mind; but we cannot but think him highly culpable in forcing them into a work of this kind; for though it may be said, that, with respect to efficient and final causes, the opinion of a general and particular Providence will form one and the same conclusion, yet we think it is of great comfort to all men, particularly to those who can trace the wonders of an almighty hand in the deep, to be sensible of a merciful interposition, concerned, and ever attentive to their support, preservation, and deliverance in times of danger. Besides, this sentiment of a divine agent superintending, and correcting the disorders introduced by natural and moral evil, is, undoubtedly, a scripture-doctrine; and from the deductions of the mere light of nature, it must appear unreasonable to suppose, that the first Great Cause who planned the whole grand scheme of creation, should not be allowed to interfere with respect to particular parts, or individuals, as occasion, circumstances, or times may require. And whoever has duly considered the wonderful protection of the Endeavour in cases of danger the most imminent, particularly when encircled, in the wide ocean, with rocks of coral, her sheathing beaten off, and her false-keel floating by her side, a hole in her bottom, and the men by turns fainting at the pumps, cannot but acknowledge the existence of a Particular Providence. The history of Joseph can only afford a more striking instance of the interposition of a divine invisible hand. This our countrymen experienced; and we have good authority to assert, that our company in the Endeavour do acknowledge, notwithstanding the private opinion of the above mentioned compiler, that the hand of superior power was particularly concerned in their protection and deliverance. This omniscient and omnipotent power it is the incumbent duty of every christian to believe, confide in, and adore.

Capt. C O O K's
SECOND VOYAGE

TOWARDS THE
South Pole and Round the World,
UNDERTAKEN and PERFORMED
By Order of his Present M A J E S T Y,
In his Majesty's Ships the Resolution and Adventure;
With the View principally of Discovering the supposed SOUTHERN CONTINENT, &c.

Begun the 9th of April 1772, and concluded on the 31st of July 1775.

Including an Account of Capt. FURNEAUX's Narrative of his Proceedings in the Adventure after the Separation of the two Ships, during which Period several of his People were destroyed by the Natives of QUEEN CHARLOTTE'S SOUND.

I N T R O D U C T I O N.

THE king's expectations were not wholly answered by former discoveries, which were so highly blazoned both at home and abroad, and therefore his majesty projected this Second Voyage of Capt. Cook, and the Navy-board was ordered to equip two such ships as were most suitable to the service. Accordingly two vessels were purchased of Capt. William Hammond, of Hull, being about fourteen or sixteen months old. They were both built at Whitby, by the same person who built the Endeavour. The largest of the two, named the Resolution, burthen four hundred and sixty-two tons, was sent to Deptford to be fitted out; and the Adventure, three hundred and thirty-six tons, was equipped at Woolwich. On the 28th of November, 1771, Capt. Cook was appointed to the command of the Resolution; and Tobias Furneaux, who had been second lieutenant with Capt. Wallis, was promoted to the command of the Adventure. The Resolution had one hundred and twelve hands on board, officers included: and the Adventure eighty-one. In the former, James Cook was captain, Robert P. Cooper, Charles Clerke, and Richard Pickersgill, were appointed lieutenants. Joseph Giffert was master; James Grey, boatswain; James Wallis, carpenter; Robert Anderson, gunner; and James Patten, surgeon. John Edgcumbe was lieutenant of the marines, under whom were one serjeant, two corporals, one drummer and fifteen privates. The rest of the crew consisted of three master's mates, six midshipmen, two surgeon's mates, one captain's clerk, one master at arms, one corporal, one armourer, his mate, one sail-maker, his mate, three boatswain's mates, carpenter's three, gunner's two, four carpenter's crew, one cook, his mate, six quarter masters, and forty-five able seamen. In the Adventure, Tobias Furneaux was captain, Joseph Shank, and Arthur Kempe, lieutenants; Peter Fannin was appointed master, Edward Johns boatswain, William Offerd carpenter, Andrew Gloag gunner, Thomas Andrews surgeon: of master's mates, midshipmen, &c. as above, the number was twenty-eight, and thirty-three able bodied seamen.

James Scott was lieutenant of the marines, under whose command were one serjeant, one corporal, one drummer, and eight privates.

The two ships were ordered to be got in readiness with the utmost expedition, and both the Navy and Victualling boards paid an uncommon attention to their equipment; even the first lord of the Admiralty visited them from time to time; in consequence of which they were not restrained by ordinary establishments, every extra article thought necessary being allowed, in order that they might be fitted completely, and in every respect to the satisfaction of those who were to embark in them. Indeed Capt. Cook sailed with greater advantages in this expedition, than any of his predecessors who had gone out before on discoveries; and we may venture to say, no future commander will ever have a commission of a more liberal kind, nor be furnished with a greater profusion of the very best stores and provisions. He had the frame of a vessel of twenty tons, one for each ship, to serve occasionally, or upon any emergency, as tenders: he had on board fishing-nets, lines and hooks of every kind; he was supplied with innumerable articles of small value, adapted to the commerce of the tropical islands: he had on board additional cloathing for the seamen, particularly suited to a cold climate, to all which were added the best instruments for astronomical and nautical observations; in which were included four time-pieces on Mr. Harrison's principles, constructed by Mess. Arnold and Kendal. And that nothing might be wanting to procure information, and that could tend to the success of the voyage, a landscape painter, Mr. William Hodges, was engaged for this important undertaking, accompanied by Mr. (now Dr.) John Reinhold Foster and Son, who were thought the most proper persons for the line of Natural History, to which they were appointed with parliamentary encouragement. Mr. William Wales, and Mr. William Bayley, were likewise engaged to make astronomical observations; the former being placed by the board of longitude, in the Resolution, and Mr. Bayley

Payley in the Adventure. Nor must we omit to mention the number of medals struck by order of the Lords of the Admiralty, and intended to be left both as presents and testimonies in new discovered countries.

The two ships were victualled and provided with all manner of necessaries for a three years voyage; among which were the following extra articles: 1. Malt, for sweet wort, designed for those whose habit of body might engender the scurvy, and as a remedy for such who might be afflicted with that disorder. The quantity prescribed for each patient, from one to six pints a day, at the discretion of the surgeon. 2. Sour KROUT, of which each seaman was to be allowed two pounds a week. This is cabbage salted down, and close packed in casks, after having been properly fermented. It is esteemed by our navigators an excellent antiscorbutic. 3. Cabbage cut small and salted down, to which is added juniper berries, and anniseeds, which are likewise put to the sour kROUT. 4. Portable soup, very nourishing, and of great utility both for invalids, and those that are in good health. 5. Oranges, rob of lemons, and saloup, for the use of the surgeons, to be administered to the sick and scorbutic only. 6. Marmalade of Carrots, recommended by Baron Storch of Berlin, as a very great antiscorbutic; but it did not as such answer our expectation. This syrup is extracted from yellow carrots, by evaporating the finer parts, till it is brought to a consistence of treacle, which it much resembles both in taste and colour. 7. Juice of wort and beer, inspissated, as the foregoing article, and intended to supply at times the place of beer, by mixing it with water. For this we were indebted to Mr. Pelham, Secretary of the Victualling-office; the commissioners of which ordered thirty-one half barrels of this juice to be prepared for trial; nine-

teen whereof were stowed in the Resolution, and twelve on board the Adventure. Thus all the conveniences necessary for the preservation of health during a long voyage, were provided in abundance; and even some alterations were made in the customary articles of provisions; wheat being substituted in the room of a quantity of oatmeal, and sugar instead of oil.

A proposed voyage attended with such extraordinary preparations, patronized by parliament, as well as royal bounty, and the execution of which being superintended by the first officers of the admiralty, the navy, and by Capt. Cook himself, we do not hesitate to pronounce one of the most important that was ever performed in any age, or by any country; and we may also with truth assert, that the able navigator made choice of by his majesty, was equal to the task in which he was embarked. Every thinking person cannot but admire his skill, his fortitude, his care of his men, his vigilance in attending to the minutest intimations of former navigators, his perseverance amidst the dangers and hardships of rigorous seasons, his prowess in leading his company just so far as they were capable of proceeding; in short, his conduct throughout, which, while he kept every man singly in strict obedience to his duty, he conciliated the affections of all, and secured their esteem. The History of his Second Voyage, which we are now about to submit to the judgement of our numerous Subscribers, will, we are persuaded, confirm the truth of this opinion; and we are happy in having received their unanimous approbation of the maps, charts, portraits, and views, which have been hitherto introduced, and which are all engraved from the originals by our most eminent artists. We hope for a continuance of their good opinion, which, in the execution of this work, we shall endeavour by all laudable means to merit and preserve.

B O O K II.

C H A P. I.

The Endeavour takes her departure from Deptford—Touches at the Island of St. Jago, one of the Cape de Verdes—Pursues her voyage to the Cape of Good Hope—Account of transactions there, and incidents that happened in her passage—Her departure from the Cape—Continues her voyage in search of a Southern Continent—Sequel of this search, between the meridian of the Cape of Good Hope and that of New Zealand—Separation of the two ships, and the arrival of the Resolution in Dusky Bay.

A. D. 1772. **T**HE Resolution and Adventure being equipped in the most complete manner, as already related, the former on the 9th of April, dropped down the river as far as Woolwich, at which place she was detained by contrary winds; but on the 22d sailed from thence to Long Reach, where she was joined by her companion the Adventure, and both ships took in their marines, guns, and ammunition. May the 10th we sailed for Plymouth, but before we got out of the river, the Resolution was found to be very crank, on which account we put into Sheerness. While some alterations were making in her upper works, Lord Sandwich and Sir Hugh Palliser paid us a visit, in order to see they were executed in a proper manner. The Resolution being again ready for sea, we departed from Sheerness. On the 2d of July we met Lord Sandwich, in the Augusta Yacht, whom we saluted with seventeen guns, and his lordship, accompanied with Sir Hugh Palliser, honoured us with their presence on board, which was the last instance of that very great attention they had paid to a variety of particulars that might tend to promote the success of our undertaking.

About this time Capt. Cook received from the board of Admiralty his instructions, dated the 25th of June, the tenor and substance of which were, that the Adventure was to be under his command: that the two ships

No. 13.

were to proceed to the island of Madeira, from thence to the Cape of Good Hope: that having at this place refreshed the ships companies, and supplied them with provisions and other necessaries, they were to make the best of their way to the southward, in search of Cape Circumcision, which, by M. Bouvet, is said to be in latitude 54 deg. S. and in about 11 deg. 20 min. E. longitude, from the Royal Observatory in the Park at Greenwich; that if they fell in with this Cape, Capt. Cook was to endeavour, by all means in his power, to discover whether the same was part of the supposed continent which had so much employed the national attention of different European powers, or only the promontory of an island: that, in either case, the gentlemen on board the two ships were diligently to explore the same, to the utmost extent possible; and to make such observations of various kinds, as might correspond with the grand object in view, and be in any respect useful to either navigation or commerce; not omitting at the same time proper remarks on the genius and temper of the inhabitants, whose friendship and alliance they were directed to conciliate, by all probable motives, and prudential means in their power: that they were to proceed on new discoveries to the eastward or westward, as the captains might judge most eligible, endeavouring only to run into as high a latitude, and as near the south pole as possible: that whatever might be

2 E

the

the result of their investigations with respect to Cape Circumcision, they were to continue their surveys to the southward, and then to the eastward, either in search of the said continent, should it not have been ascertained, or to make discoveries of such islands as might be seated in the hitherto unexplored and unknown parts of the southern latitudes: that, having circumnavigated the globe, they were to return to Spithead by the way of the Cape of Good Hope: and that to answer the intentions of government in this voyage as fully as possible, when the season of the year rendered it unsafe to continue in high latitudes, they were to repair to some known port to the northward; and after having refitted, &c. they were to return again, at the proper season, to the southward, in prosecution of new discoveries there. It may not be amiss here to observe, that these orders were not intended in any respect to cramp Capt. Cook, who was allowed, in case the *Resolution* should be lost, to continue his voyage in the *Adventure*: he had to this end assistants out of number: his stay was not even hinted at: he was not obliged to return at any limited time; in short he had ample power, full authority, and, in all unforeseen cases, he was to proceed according to his own discretion, and act entirely as he pleased. We beg leave further to observe, that in the history of this voyage, Greenwich is made our first meridian, and from hence the longitude is reckoned E. and W. to 180 deg. each way. And our readers will also take notice, that whenever the initial letters, A. M. and P. M. of ante-meridianum, and post-meridianum, are used, the former signifies the forenoon, and the latter the afternoon of the same day.

A copy of the above instructions were transmitted to Captain Furneaux, inclosed with Capt. Cook's orders, in which he appointed, should the two ships be separated, the island of Madeira for the first place of rendezvous; Port Praya for the second; the Cape of Good Hope for the third; and new Zealand for the fourth.

While we remained at Plymouth, our astronomers, Mr. Wales, and Mr. Bayley, made observations on Drake's Island; when the latitude was found to be 50 deg. 21 min. 30 sec. N. and the longitude 4 deg. 20 min. W. of Greenwich; whereby the true time for putting the time-pieces and watches in motion was ascertained. This was done on the 13th of July, and they were set a-going, in the presence of the two astronomers, Capt. Furneaux, Capt. Cook, and the two first lieutenants of the ships. These had each of them keys of the boxes which contained the watches, and were always to be present at the winding them up, and comparing the one with the other, unless prevented by indisposition. This day, the ships crews, according to the custom of the navy, received two months wages in advance. As a further encouragement, and that they might provide necessaries for the voyage, they were likewise paid the wages due to them to the 28th of the preceding May.

On Sunday the 12th of July, the *Resolution* broke from her moorings in the Sound, and was adrift together with the transport buoy to which she was fastened. All hands were on deck instantly, the cables were cleared, and the sails spread. We passed the *Adventure*, and came to an anchor, after having escaped the very apparent danger of being dashed against the rocks which are under the fort. This favourable event was looked upon by our seamen as an omen to the success of the voyage. It was undoubtedly an instance of the care of Divine Providence, exerted for our protection in so critical a moment. Indeed the whole of our voyage, equally with this circumstance, demonstrates, that a divine power was absolutely necessary to protect us in times of danger, and to give us a safe return.

On Monday the 13th at six o'clock, A. M. the two ships sailed from Plymouth Sound, in company, and passed the Eddystone, which is a lofty, well contrived tower, of the utmost advantage to navigation and commerce. As we stood off shore, the wind increased, and the billows rolled higher and higher. Most of the seamen both old and young were affected with sickness. On the 20th, we fell in with Cape Ortegal on the coast

of Galicia. The country appears hilly, and the tops of the hills are covered with wood. The sea now grew perfectly calm, and the prospect which surrounded us was very delightful. When in sight of Cape Finisterre, bearing W. S. W. seven or eight leagues, we were met by a small French Tartan from Marseilles, freighted with flour from Ferrol and Corunna. We obtained from them a small supply of fresh water, which we much wanted, having been obliged to subsist on bread and our wine. On the 22d, in the afternoon, we passed two Spanish men of war, one of which fired a shot at the *Adventure* to bring her to; but on hailing her, and being told we were king's ships, made a proper apology, and very politely took leave, wishing us a good voyage. On Wednesday, the 29th, about nine at night, we anchored in Funchiale road, in the island of Madeira. After having saluted the garrison with eleven guns, and they had returned the compliment, we went on shore, accompanied by the two Forsters, and were conducted by Mr. Sills, a gentleman from the vice-consul, to the house of Mr. Loughmans, a considerable English merchant, who assisted us with every accommodation the island and his house afforded, during our stay. Here the officers and private men furnished themselves with such stocks of wine as they could conveniently purchase.

The Madeira, or Madera islands are only three in number; namely, Madeira, properly so called; the island of Puerto, or Porto Santo; and *Illa Deserta*, or the Desolate Isle. They are situated to the N. of the Salvages, and in the Atlantic ocean, between thirty-two and thirty-three deg. and seventeen and eighteen deg. W. longitude, two hundred and fifty miles N. by E. from Teneriff, three hundred and sixty from Cape Cantin on the coast of Africa, and three hundred N. of the island of Farro. They were thus named from the principal of them, which was called by the Portuguese Madeira, signifying a wood or forest, from its being overgrown with trees. They were first discovered by an English gentleman, and many years after by the Portuguese; and as there is something extremely singular in both these occurrences, but more particularly the first, we shall, for the entertainment of our readers, relate the circumstances attending it.

In the reign of Edward III. king of England, a young gentleman, named Robert Machin, conceived a violent passion for Ann D'Arfet, a beautiful and accomplished lady of a noble family. Machin, with respect to birth and fortune, was inferior to the lady; but his personal qualifications overcame every scruple on that account, and she rewarded his attachment with a reciprocal affection. Their friends, however, beheld the young gentleman in a different light; they fancied their blood would be contaminated by an alliance with one of a lower rank, and therefore determined to sacrifice the happiness of the young lady, to the hereditary pride of blood, and their own mercenary and interested motives. In consequence of these ideas, a warrant was procured from the king, under the sanction of which Machin was apprehended, and kept in close confinement, till the object of his affections was married to a nobleman, whose chief merit lay in his honorary title and large possessions; and immediately after the nuptial ceremony was over, the peer took his beautiful bride with him to a strong castle which he had in the neighbourhood of Bristol, and then the unfortunate lover was set at liberty.

After being released from his cruel confinement, Machin was acquainted that his mistress had been compelled to give her hand to another. This rendered him almost frantic, and he vowed to revenge the violence done to the lady, and the injury which he himself had sustained; and with this view, imparted his design to some of his friends and companions, who engaged to accompany him to Bristol, and assist him in whatever enterprise he undertook. Accordingly one of his comrades contrived to get himself hired by the nobleman as a servant, and by that means being introduced into the family, he soon found an opportunity to let the lady know the sentiments and intentions of her lover; when

when she fully entered into all his projects, and promised to comply with whatever he should propose. To facilitate their designs, the lady appeared more cheerful than usual, which lulled asleep every suspicion that her lord might otherwise have entertained; the also entreated permission to ride out daily to take the air for the benefit of her health, which request her consort easily granted. This point being gained, she did not fail to take advantage of it, by riding out every morning accompanied by one servant only, which was her lover's companion, he having been previously pitched upon always to attend her by her own contrivance.

Matters being thus prepared, she one day rode out as usual, when her attendant conducted her to his friend, who waited at the sea side to receive her. They all three immediately entered a boat, and soon reached a ship that lay at some distance ready to receive them on board; and Machin, having the object of his wishes on board, immediately, with the assistance of his associates, set sail, intending to proceed to France; but all on board being ignorant of maritime affairs, and the wind blowing a hard gale, they missed their port, and the next morning, to their astonishment, found themselves driven into the main ocean. In this miserable condition, they abandoned themselves to despair, and committed their fates to the mercy of the waves. Without a pilot, almost destitute of provisions, and quite devoid of hope, they were tossed about for the space of thirteen days. At length, when the morning of the fourteenth day began to dawn, they fancied they could descry something very near them, that had the appearance of land; and when the sun rose, to their great joy they could distinctly perceive it was such. Their pleasure, however, was in some measure lessened by the reflection, that it was a strange country; for they plainly perceived it was covered with a variety of trees, whose nature and appearance they had not the least knowledge of. Soon after this, some of them landed from the sloop, in order to make their observations on the country; when, returning soon after to the ship, they highly commended the place, but at the same time believed there were no inhabitants in it.

The lover and his mistress, with some of his friends, then landed, leaving the rest to take care of the ship. The country appeared beautifully diversified with hills and dales, shaded with various trees, and watered by many clear meandering streams. The most beautiful birds of different species perched upon their heads, arms, and hands, unapprehensive of danger; and several kinds of wild beasts approached, without offering any violence to them. After having penetrated through several woody recesses, they entered a fine meadow admirably incircled with a border of laurels, finely enamelled with various flowers, and happily watered with a meandering crystal rivulet. Upon an eminence in the midst of this meadow, they saw a lofty spreading tree, the beauty of which invited them to repose under its shade, and partake of the shelter it would afford them from the piercing rays of the sun. They at length attempted to make a temporary residence beneath this tree; and, providing themselves with boughs from the neighbouring woods, they built several small huts, or arbours. They passed their time very agreeably in this place, from whence they made frequent excursions into the neighbouring country, admiring its strange productions and various beauties. Their happiness, however, was of no very long continuance; for one night a terrible storm arose from the N. E. which tore the ship from her anchor, and drove her to sea. The crew were obliged to submit to the mercy of the elements, when they were driven to the coast of Morocco, where the ship being stranded, the whole crew was made captives by the Moors.

Machin and his companions, having missed the ship the next morning, they concluded she had foundered, and was gone to the bottom. This new calamity plunged them into the deepest melancholy, and so greatly affected the lady, that she could not support herself under it. She had indeed before continually fed her grief, by sad prefiges of the enterprize's ending in some

fatal catastrophe to all concerned; but the shock of the late disaster struck her dumb; so that she expired in three days afterwards, in the most bitter agonies. The death of the lady affected Machin to such a degree, that he survived her but four days, notwithstanding the utmost endeavours of his companions to afford him consolation. Previous to his death, he begged them to place his body in the same grave with her's, which they had made at the foot of an altar, erected under the beautiful lofty tree before-mentioned. They afterwards placed upon it a large wooden cross; and near that an inscription, drawn up by Machin himself, containing a succinct account of the whole adventure; and concluded with a request, that if any Christians should come thither to settle, that they would build and dedicate a church to Jesus Christ upon that spot. The remaining companions of Machin, after his death, determined to attempt returning to England in the sloop, which had been so well secured near the shore, as not to be in the least damaged by the storm which had driven away the ship. But, happening to take the same course the others had been forced upon, they unfortunately arrived in like manner upon some part of the coast of Morocco, where they met with exactly the same fate, being seized in a similar manner, and carried to the same prison. Here they met with several other Christian slaves, besides their own companions; particularly one John de Morales, a Spaniard of Seville. This man was an excellent sailor, and took a peculiar delight in hearing the English captives rehearse their adventures, by which means he learnt the situation and particular marks of this new discovered country, which he took care to retain in his memory.

In process of time, John I. king of Portugal, having entered into a war with the Moors, passed over into Africa with a formidable army; and in the year 1415 laid siege to and took Ceuta. In this expedition, he was accompanied by his sons, one of whom, prince Henry, took great delight in the study of the mathematics, particularly geography and navigation. Upon this occasion, they had a great opportunity of conversing with the Moors and African Jews; and informing himself, by their means, of the situation of several foreign countries, the seas about them, their coasts, &c. Hence grew an insatiable thirst for making new conquests; and from this time he was determined to devote his attention to the discovery of unknown countries. In consequence of which resolution, he retired, after the reduction of Ceuta, to the Algarves, where he found a new town within a league of Cape St. Vincent, erected a fort to defend it, and determined to send out ships from thence upon discoveries. The person he intended to employ as chief commander, upon these occasions, was a gentleman of extraordinary abilities, named Juan Goncalvo Zarco, who became famous not only for his maritime discoveries, but for being the first person who introduced the use of artillery on board ships. In 1418 he discovered Puerto Santo, one of the Madeiras; and in 1420 he passed the straits, and surveyed a considerable extent of the coast of Africa. In the mean time, a Spanish prince dying, left by his will a large sum of money for the purpose of redeeming Spanish Christians, who were kept as slaves in Morocco. Terms being agreed upon between the emperor of Morocco and the commissioners, for the redemption of those captives, a Spanish ship was sent to Morocco to fetch home the redeemed Christians, among whom was John de Morales before-mentioned. On the return of this ship to Spain, it happened to fall in with the squadron commanded by Juan Goncalvo Zarco, who was, as we have just noticed, then passing the straits to make observations on the coast of Africa. Spain and Portugal being at this time at war, Juan Goncalvo Zarco made prize of the Spanish ship; but finding it contained only redeemed captives, he was touched with compassion at the miseries they had already suffered during their slavery, and generously dismissed them, taking out only John de Morales, whom he found to be a very intelligent person, an able sailor, and an expert pilot.

When

When Morales was informed of the reason of his detention, and the discoveries that the Portuguese were upon, he was mightily rejoiced, and offered voluntarily to enter into the service of prince Henry. He then told the Portuguese commander of the island which had been lately discovered by the English, related the story of the two unfortunate lovers, and every other circumstance, which, during his captivity, he had heard from Machin's companions. Gonfálvo was so delighted with his relation, that he tacked about, and returned to the new town which prince Henry had built, called Terra Nabal. On his arrival, he introduced Morales to the prince, when the Spaniard again repeated all that he had before told to Juan Gonfálvo. The prince thought this worthy of becoming a national affair; and therefore, communicating the whole to the king his father, and the Portuguese ministry, they determined to pursue the discovery; and for that purpose fitted out a good ship, well manned and provided, and a sloop to go with oars, when occasion required: and Juan Gonfálvo was appointed to the whole command. Some Portuguese, on the discovery of Puerto Santo a short time before, had been left by Gonfálvo on that island; and judging by the account of Morales, concerning the situation of the island they were in quest of, that it could not be far from Puerto Santo, he determined to sail thither; where when he arrived, the Portuguese whom he had left behind, informed him, that they had observed to the north-east a thick impenetrable darkness, which constantly hung upon the sea, and extended itself upward to the heavens. That they never knew it to be diminished; but a strange noise which they could not account for, was often heard from thence.

John de Morales appeared to be convinced that this was the island they were in search of; and Juan Gonfálvo was inclined to coincide with him; but all the rest were terrified at the accounts they had heard. It was therefore concluded to remain at Puerto Santo till the change of the moon, to see what effect that would have upon the shade, or whether the noise would cease. But perceiving no alteration of any kind, the panic increased among the generality of the adventurers. Morales, however, stood firm to his opinion of that being the island they were looking for; and very sensibly observed, that, according to the accounts he had received from the English, the ground was covered over with lofty shady trees; it was no wonder, therefore, that it should be exceeding damp, and that the humid vapours might exhale from it by the power of the sun, which, spreading themselves to the sky, occasioned the dark clouds they saw; and with respect to the noise, that might be occasioned by certain currents dashing against the rocks on the coast of the island.

Notwithstanding these obstacles, Juan Gonfálvo determined to proceed; and, setting sail the next day, he at length made land; and the fear of those who had been all along terrified, now vanished. The first point they saw, they named St. Lawrence's Point: doubling this, they found to the southward, rising land, whither Morales and others were sent in a sloop to reconnoitre the coast; and came to a bay which seemed to answer the description given by the English. Here they landed; and finding the cross and inscription over the grave of the two lovers, they returned to Juan Gonfálvo with an account of their success; whereupon he immediately landed, and took possession of the place, in the name of John I. king of Portugal, and prince Henry his son. Having built an altar near the grave, they searched about the island, in order to discover if it contained any cattle; but not finding any, they coasted westward, till they came to a place where four fine rivers ran into the sea, of the waters of which Juan Gonfálvo filled some bottles, to carry as a present to prince Henry. Proceeding farther, they came to a fine valley, which was intersected by a beautiful river, and after that to a pleasant spot covered with trees, some of which being fallen down, Juan Gonfálvo ordered a cross to be erected of the timber, and called the place Santa Cruz, or Holy Cross. After this, they began to

look out for a place proper to fix their residence in while they stayed: and at length found a fine tract of land, not so woody as the rest of the country, but covered over with fennel, which, in the Portuguese language, is called Funcho; from thence the town of Funchal, or Funchiale, took its name, which was afterwards built on the same spot.

Juan Gonfálvo, after having viewed other parts of the island, and finding daily cause for new admiration of the beauties continually discovered, returned to Portugal, and arrived at Lisbon in the end of August 1420, without having lost a single man in the whole enterprise: and a day of audience being appointed for him to make his report of his voyage, the king gave the name of Madeira to the new discovered island, on account of the great quantity of excellent wood found upon it. Soon after an order was made for Juan Gonfálvo to return to Madeira in the ensuing spring, with the title of captain-governor of Madeira, to which title the heir of his family at present adds that of count. He accordingly set sail on his second voyage in May 1421, taking with him the greatest part of his family, and arriving at Madeira he cast anchor in the road, till then called the English Port; but Gonfálvo, in honour of the first discoverer, then called it Puerto de Machino, from which name it was corrupted to Machico, which it now bears. He then ordered the large spreading beautiful tree before-mentioned (under which Machin and his companions had taken up their residence) to be cut down, and a small church to be erected with the timber; which, agreeable to Machin's request, he dedicated to Jesus Christ, and intersected the pavement of the choir with the bones of the two unfortunate lovers. He soon after laid the foundation of the town of Funchal, which afterwards became famous; and the altar of the new wooden church was dedicated to St. Catharine, by his wife Constanza, who was with him.

John I. king of Portugal, dying, his eldest son and successor Duarte, in consideration of the great sums of money expended in peopling this island, by prince Henry his brother, gave him the revenues of it for life. He likewise gave the spiritualities of it to the order of Christ, which endowment Alonzo XV. afterwards confirmed.

The island of Madeira, properly so called, is composed of one continued hill of a wonderful height, extending from east to west: the declivity of which, on the south side, is cultivated and interspersed with vineyards; and in the midst of this slope, the merchants have fixed their country-seats, which help to render the prospect very agreeable. The air is more moderate than that in the Canary Islands, and the soil more fertile in corn, wine, sugar, and fruits. Fine springs abound almost in every part, besides which there are eight good rivers. The great plenty of water first suggested the hint to prince Henry of sending sugar canes to Madeira from Italy, which greatly improved through the increase of heat, and produced more than in their native soil.

This island affords plenty of citrons, bananas, peaches, apricots, plums, cherries, figs and walnuts; with oranges of all sorts, and lemons of a prodigious size. Fruit-trees from Europe thrive here in perfection; and the natives are said to make the best sweatmeats of any in the world, and particularly greatly excel in preserving citrons and oranges, and in making marmalade and perfumed pastes, which greatly excel those of Genoa. The sugar made here is very fine, and has the smell of violets; this, indeed, is said to be the first place in the West where this manufacture was set on foot, and from thence was carried to America: but afterwards the sugar-plantations at Brazil prospering extremely, the greatest part of the sugar-canes in this island were pulled up, and vineyards planted in their stead, that produce excellent wines, which, the author of Lord Anson's voyage observes, seems to be designed by Providence to exhilarate and comfort the inhabitants of the torrid zone. The cedar-tree here is very strait, tall, and thick, and has a rich scent. The wood of the mastic tree is of a red rose colour; here are also the mastic and

and gum-dragon trees; and besides fruit-trees there are a variety of other trees, which are common both to Europe and Africa. The everlasting-flower is a great curiosity; for when it is plucked it cannot be perceived to fade; it grows like sage, flowers like camomile, and always appears fresh and blooming. Vines are in abundance; and from the grapes which they produce a vast quantity of the most delicious wines are made. Indeed the soil is so well adapted for the cultivation of vines, that the grapes exceed the leaves in number, and some of the bunches are sixteen or eighteen inches in length. Here are several sorts of these wines; one is of the colour of champagne, but is not much valued: another sort is a white wine, much stronger than the former. A third sort is excellent, and resembles malmsey, it being of the same nature with that which grows in Teneriff: and another resembles Alicant wine, but is much inferior to it in taste, and is never drank alone, but mixed with the other sorts, to which it gives a colour and strength to keep. It is observable of the Madeira wines, that they are greatly improved by the heat of the sun, when exposed to it in the barrel, after the bung is taken out. In the whole island they annually make about twenty-eight thousand pipes, eight thousand of which are drank there, and the rest exported, the greatest part being sent to the West-Indies. The wines that are brought directly to England, are not equal in goodness to such as are first carried to the West-Indies; and their flavour is exceedingly heightened, if they remain some time in Barbadoes. The product of each vineyard is usually divided equally between the proprietor, and the person who gathers and presses the grapes; it commonly happens, however, that while the merchant is rich, the gatherer is poor. The people here trade among themselves, or barter.

The principal town in the whole island is Funchal, or Funchiale, and is seated in the south part of the island at the bottom of a large bay, in latitude 32 deg. 33 min. 34 sec. N. and in 17 deg. 12 min. W. longitude. We deduced the longitude from lunar observations, and Mr. Wales reduced the same for the town by Mr. Kendall's watch, which makes the longitude of Funchiale, 17 deg. 10 min. 14 sec. W. Towards the sea it is fortified by a high wall, with a battery of cannon, besides a castle on the Loo, which is a rock standing in the water at a small distance from the shore. This town is the only place of trade, and indeed the only place where it is possible for a boat to land: and even here the beach is covered with large stones, and a violent surf continually beats upon it. The only good time for landing is before the sea-breeze comes on. The town is very populous, but the majority of the inhabitants are not natural-born Portuguese; for a great number of English and French Roman catholics settled there, who live after the Portuguese manner; some English protestants, and a prodigious number of negroes and mulattoes, both freemen and slaves. The streets are straight, and drawn by a line, and their houses are pretty well built; their churches are well-built beautiful structures, enriched with gilding, fine pictures, and plate, and people are said to meet in them upon business that has little relation to devotion.

Those women who have no domestic chapels, never go to church but on Sundays and holidays; when, if there be several daughters, they walk two and two before the mother, each having a large thin veil over her face; but their breasts and shoulders are quite bare. By their side walks a venerable old man, with a string of beads in his hand, and armed with a sword and dagger. This town is the see of a bishop, who has the whole island under his spiritual jurisdiction, and is suffragan to the archbishop of Lisbon. The governor of the island also resides here.

In the island are two other towns; one called Man-chico, which has a church named Santa Cruz, or the Holy Cross, and a convent of Bernardine-friars; the other town is named Moncerito. In short, the island lately contained thirty-six parishes, a college, and a monastery of jesuits, five other monasteries, eighty-two

No. 13.

hermitages, and five hospitals. There are several fine seats and castles about the country, in which the merchants chiefly reside.

The ordinary food of the poorer people, in the time of vintage, is little else than bread and rich grapes; and were it not for their abstemiousness, fevers in the hot seasons would be frequent; therefore even the rich, in the hot months, are very moderate in their diet and drinking. The generality of the people affect great gravity in their deportment, and usually dress in black; but they cannot dispense with the spado and dagger, which even servants wear; so that you may see a footman waiting at table with a sword at least a yard long, and a great basket hilt to it. The houses in general are plain, as the inhabitants put themselves at no great expence in furnishing them. The windows are secured by wooden shutters at night, and instead of being glazed, are latticed. With respect to their marriages, affection is never considered, the principle enquiries are into family descent and circumstances; the women are prohibited from marrying Englishmen, unless the latter consent to embrace the Roman catholic religion. Murders are very frequent, on account of the great numbers of places deemed sanctuaries, and the ease with which a murderer can thereby screen himself from justice. But if the criminal is taken before he can reach the sanctuary, the punishment is only either banishment or imprisonment, both which, by a pecuniary composition, may be evaded.

Here are a great number of clergy, who are generally rich; but none who are descended from Moors or Jews are admitted to take orders. The churches are made repositories for the dead, and the corpse is curiously dressed and adorned: yet in the interment, store of lime is used, in order to consume the body as speedily as possible, which usually happens in a fortnight; so that there is then room for another corpse. The bodies of protestants are not allowed to be buried, but must be thrown into the sea; nevertheless they are permitted to be interred in consecrated ground, provided a handsome sum of money is paid to the clergy.

Puerto Santo is generally termed one of the Madeira islands, and lies to the north-east of Madeira, in 32 deg. 30 min. N. latitude, and in 16 deg. 5 min. W. longitude from London, and is only about 15 miles in circumference. It was discovered in the year 1412, by two Portuguese gentlemen, one of whom was Don Juan Goncalvo, sent by prince Henry, son to John I. king of Portugal, to double Cape Bajador, in order to make farther discoveries; but being surprised by a violent storm, were driven out to sea, and, when they gave themselves over for lost, had the happiness to find this island, which proving a safe asylum to them, they called it Puerto Santo, or the Holy Port.

This island produces wheat and other corn, just sufficient for the support of the inhabitants: here also are plenty of oxen, wild hogs, and a vast number of rabbits. There are trees which produce the gum called dragon's blood, and likewise a little honey and wax, which are extremely good. It has properly no harbour, but there is good mooring in the road, which affords a convenient retreat for ships going to Africa, or coming from the Indies; so that merchantmen often stop there, which affords considerable profit to the inhabitants, who are descended from the Portuguese, to whom the island is subject. The inhabitants are all Roman catholics, being under the spiritual jurisdiction of the bishop of Funchal in Madeira. They would live a very quiet life, were it not for the pirates, who often pay them troublesome visits. In the year 1617, they landed here, and carried off six hundred and sixty-three prisoners, besides plundering the place.

There is a little island called the Defart, which produces only orchilla-weed, and some goats are on it: it lies on the east-side of Madeira, at about six leagues distance.

On Saturday the 1st of August, having stowed on board a supply of water, wine, and other necessaries, we set sail, lost sight of Madeira, and stood to the southward,

southward, with a gentle gale at N. E. On Tuesday the 4th, we saw the pleasant island of Palma, bearing S. S. W. distant about three or four leagues. This is one of the Canary isles. It may be seen, on account of its height, twelve or fourteen leagues at sea, and lies in latitude 28 deg. 38 min. N. and in 17 deg. 58 min. W. longitude. On Wednesday, the 5th, we passed the isle of Ferro, at the distance of fourteen leagues.

The island of Palma lies about fifty miles to the W. of Teneriffe, and two hundred W. of the continent of Africa. It is about thirty miles long, twenty broad, and seventy in circuit. On the N. E. part of the island, within land, is a high and spacious mountain, steep on all sides. This is called La Caldera, or the cauldron, from a hollow like that on the pike of Teneriffe. The summit is about two leagues in circumference, and on the inside the cauldron descends gradually from thence to the bottom, which is a space of about thirty acres. On the declivity of the inside spring several rivulets, which joining together at the bottom, issue in one stream through a passage to the outside of the mountain from which this brook descends; and having run some distance from thence, turns two sugar-mills. The water of this stream is unwholesome, on account of its being mixed with some water of a pernicious quality in the cauldron; all the inside of which abounds with herbage, and is covered with palms, pitch-pine, laurel, lignum-rhodium, and retamas; which last have in this island a yellow bark, and grow to the size of large trees; but in the others they are only shrubs. The people here take great care not to let the he goats feed on the leaves of the retama, on account of their breeding a stone in the bladder, which is mortal. Two rivulets spring on the outside of the cauldron; one of these runs northward to the village of St. Andrew, and turns two sugar-mills, and the other runs to the town of Palmas, which lies to the eastward. These are the only rivulets or streams of any consequence in the island: on which account the natives build tanks, or square reservoirs with planks of pitch-pine, which they make tight with caulking. These they fill with the torrents of rain-water that in the winter season rush down from the mountains, and preserve it for themselves and cattle: but the sheep, goats, and hogs, in places at a distance from the rivulets, feed almost all the year round on the roots of fern and asphodil, and therefore have little or no need of water, there being moisture enough in those roots to supply the want of that element. Though the fourth quarter of the island is most destitute of water, yet there is a medicinal well of hot water so close to the sea-shore, that the tide flows into it at full sea.

At Uguer is a cave, that has a long narrow entrance, so straight that people pass through it backwards, with their face to the mouth of the cave; but after they have got through this passage, they enter a spacious grotto, where water distils from between the large flakes of slate stones that hang from the roof; the least blow given to these, resounds with a noise like thunder through the cave. In the district of Tifuya is a mountain, which appears to have been removed by an earthquake from its original situation. The natives have a tradition, that the spot on which it now stands was a plain, and the most fertile spot in the whole island, till it was destroyed by the burning lava, and the fall of the mountain. Indeed, the effects of volcanos are to be seen in almost every part of the island; for the channels where the burning matter, melted ores, and calcined stones and ashes ran, may be easily distinguished by a curious observer. Nunno de Penna, in his Historical Memoirs, relates, that on the 13th of November 1677, a little after sun-set, the earth shook for thirteen leagues with a dreadful noise, that continued five days, during which it opened in several places; but the greatest gap was upon the mountain of La Caldera, a mile and a half from the sea, from whence proceeded a great fire, which cast up stones and pieces of rock. The like happened in several places thereabouts, and in less than a quarter of an hour were twenty-eight gaps about the foot of the mountain, which cast forth abundance of flames and burning stones. The

same person adds, that on the 20th of November following, there was a second eruption of the same mount, from whence came forth stones and fire, with great earthquakes and thunders for several days, so that black cinders were taken up at seven leagues distance: the adjacent ground was entirely wasted, and the inhabitants forced to quit their dwellings. The last volcano that happened in this island was in 1750, when one of these rivers of fire ran, with great rapidity, from the mountains towards the town of Palmas, and discharged itself about a mile to the northward of the town, but we have not learnt that any considerable eruption hath happened since that time.

If we take a view of Palma at the distance of three leagues off at sea, the mountains seem full of gutters or beds formed by torrents of rain water; but these only appear little from their height and distance; for we find them to be large vallies, abounding with woods, on a nearer approach. In many places on the shore of this and the other islands, is found the black shining sand used to throw upon writing, to prevent its blotting. It appears to have been cast out of volcanos, for the load-stone, when held near it, will draw up every grain of it.

The air, weather, and winds are nearly the same as at Teneriff and Canaria, except that the westerly winds and rain are more frequent at Palma, on account of its lying more to the westward and northward, and on that account is not so far within the verge of the N. E. trade winds as those islands; whence it is particularly exposed to the S. wind, which mostly prevails in the latitudes adjacent to those of the N. E. trade-winds, as well as to variable winds from other quarters.

The climate here, and in Teneriffe, Canaria, and Gomera, differs greatly, according as a person lives in the mountains, or near the sea shore. During a calm, the heat seems almost intolerable near the shore, in the months of July, August and September; but the air is at the same time quite fresh and pleasant on the mountains. In the middle of winter the houses upon these, some of which are near the clouds, must be extremely cold, and the natives keep fires burning in their habitations all day long; but this is far from being the case near the sea, where they use fires only in their kitchens. The summits of all the Canary isles, except Lancerota and Fuerteventura, are generally covered with snow for eight months in the year. The summit of Palma formerly abounded with trees, but a great drought in 1545 destroyed them all; and though others began to spring up some time after, they were destroyed by the rabbits and other animals, which finding no pasture below, went up there, and destroyed all the young shrubs and trees, so that the upper part of the island is at present quite bare and desolate. Before the trees and shrubs were destroyed, a great deal of manna fell there, which the natives gathered and sent to Spain. The rabbits were first brought to Palma by Don Pedro Fernandez de Lago, the learned lieutenant-general of Teneriffe, and have since increased in a surprising manner.

Palma affords nearly the same productions as Canaria, but a great quantity of sugar is made here, particularly on the S. W. side of the island. The principal port is called by the same name, and is situated on the south side of the island. The road is about a quarter of a mile from the shore, where vessels generally ride in fifteen or twenty fathoms water; and with good anchors and cables, notwithstanding the easterly winds, they may ride with great safety in all the winds that blow in this part of the world. The town is large, containing two parish churches, several convents, with many private buildings, though they are neither so good nor so large as those in the city of Palmas in Canaria, or of the towns in Teneriffe. Near the mole is a castle or battery, mounted with some pieces of cannon, for the defence of the ships in the bay, and to prevent the landing of an enemy. There are no other towns of note in Palma; but many villages, the chief of which is called St. Andrew, where there are four engines for the making of sugar; but the land hereabouts

abouts is very poor, so that the inhabitants are supplied from the island of Teneriffe with grain and other necessary articles.

For the amusement of uninformed readers, we shall here add an account of the island of Ferro, and also a particular description of the present natives of the islands of Canaria, Teneriffe, Palma, Gomera, and Ferro; their persons, habit, diet, buildings, manners, customs, &c.

The Spaniards call the island of Ferro, Hierro, and the French the *île de Fer*, or the island of Iron: it is the most westerly of all the Canaries, and is about thirty miles long, fifteen broad, and seventy-five in circumference. The French navigators formerly placed in the center of this island their first meridian for reckoning the longitude, as the Dutch did theirs at the pike of Teneriffe; but at present most geographers reckon their first meridian from the capital of their own country, as the English from London, the French from Paris, &c. It being more convenient, and conveying a more distinct idea to say, that such a place is so many leagues distant E. or W. from the capital of his own country, than to reckon the longitude from a distant land.

This island of Ferro rises on all sides steep and craggy from the sea-shore above a league, so as to render the ascent extremely difficult and fatiguing; but after travelling thus far, the rest of the island will be found to be tolerably level and fruitful, abounding with many kinds of trees and shrubs, and producing better grass, herbs, and flowers, than any of the other islands, whence bees thrive and multiply here in a very extraordinary manner, and excellent honey is made by them. There are but few springs in the whole island; and on account of the scarcity of water, the sheep, goats, and swine, do not drink in summer, but quench their thirst at that season, by digging up and chewing the roots of fern. The great cattle are watered at a place where water distils from the leaves of a tree. Many authors have made mention of this tree, some of whom represent it as miraculous; while others deny its very existence: but the author of the history of the Discovery and Conquest of the Canary Islands, gives a particular account of it, which we shall here insert for the satisfaction of the curious.

In the cliff or steep rocky ascent by which the whole island is surrounded, is a narrow gutter which commences at the sea, and is continued to the summit of the cliff, where it joins, or coincides, with a valley terminated by the steep front of a rock, on the top of which grows a tree called in the language of the ancient inhabitants *garfe*, or *sacred*, which for many years has been preserved entire, sound, and fresh. Its leaves constantly distil so great a quantity of water, that it is sufficient to furnish drink to every living creature in Hierro, nature having provided this remedy for the drought of the island. It is distinct from other trees, and stands by itself: its trunk is about twelve spans in circumference; its height from the ground to the top of the highest branch is forty spans, and the circumference of all the branches together is one hundred and twenty feet. The branches are thick and extended, and the lowest begin about the height of an ell from the ground. Its fruit resembles an acorn, but tastes like the kernel of a pine apple, only it is softer, and more aromatic; and the leaves resemble those of the laurel, but are larger, wider, and more curved. These come forth in a perpetual succession, whence the tree always remains green. Near it grows a thorn, which fastens on many of its branches, with which it is interwoven, and some beech trees, *brefos*, and thorns, are at a small distance from it. On the north side of the trunk are two large tanks or cisterns of rough stone, or rather one cistern divided; each half being twenty feet square, and sixteen spans deep. One of these contains water for the drinking of the inhabitants, and the other that which they use for their cattle, washing, and the like purposes.

A cloud or mist rises from the sea every morning, which the south and easterly winds force against the above-mentioned steep cliff; when the cloud having

no vent but by the gutter, gradually ascends it, and advances slowly from thence to the extremity of the valley, and then rests upon the wide-spreading branches of the tree, from whence it distils in drops during the remainder of the day, in the same manner as water drips from the leaves of trees after a heavy shower of rain. This distillation is not peculiar to the tree, for the *brefos* which grow near it also drop water; but their leaves being only few and narrow, the quantity is so trifling, that though the natives save some of it, yet they make little account of any but what distils from the tree; which, together with the water of some springs, is sufficient to serve the natives and their cattle. It has been remarked, that this tree yields most water in those years when the easterly winds have most prevailed; for by them alone the clouds or mists are drawn hither from the sea. A person lives near the spot on which the tree grows, who is appointed by the council to take care of it and its water, and is allowed a certain salary, with a house to live in. He daily distributes to each family of the district seven vessels filled with water, besides what he gives to the principal persons of the island.

Mr. Glas says, he is unable to determine whether the tree which yields water at present be the same here described, but justly observes, that it is probable there have been a succession of them. He himself did not see this tree, for this is the only island of all the Canaries which he did not visit; but he observes, that he has sailed with the natives of Hierro, who, when questioned about the existence of this tree, answered in the affirmative; and takes notice, that trees yielding water are not peculiar to this island, since one of the same kind in the island of St. Thomas, in the gulf of Guiney, is mentioned by some travellers.

By reason of a scarcity of water, the soil, in some parts of this island, is very barren; but in others it is fertile, and produces all the necessary articles for the support of the inhabitants. The sheep, goats, and hogs, that are brought up in those parts distant from the rivulets, feed almost all the year round on the roots of fern and *aphodil*, and therefore have little occasion for water, as the want of that element is supplied by the great moisture that is naturally in those roots.

There is only one small town in this island, and the most distinguished building in it is a parish church. Many small villages are dispersed about the town, but there are not any of them that deserve a particular description.

Small cattle, brandy, honey, and orchilla weed, are the chief articles of the trade carried on by the inhabitants of this island.

As to the original natives of the island of Ferro, we are told by travellers, that before it was rendered subject to Spain they were of a middle stature, and clothed with the skins of beasts. The men wore a cloak of three sheep-skins sewed together, with the woolly side outwards in summer, and next their bodies in winter. The women also wore the same kind of cloak, besides which they had a petticoat, which reached down to the middle of their legs. They sewed their skins with thongs cut as fine as thread, and for needles used small bones sharpened. They wore nothing on their heads, and their long hair was made up into a number of small plaits. They had shoes made of the raw skins of sheep, hogs, or goats. These people had a grave turn of mind, for all their songs were on serious subjects, and set to slow plaintive tunes, to which they danced in a ring, joining hands, and sometimes jumping up in pairs, so regularly that they seemed to be united; they still practise in Ferro this manner of dancing. Their dwellings consisted of circular inclosures, formed by a stone wall without cement, each having one narrow entrance. On the inside they placed poles or spars against the wall, one end resting on the top, and the other extending a considerable distance to the ground; and these they covered with fern, or branches of trees. Each of these inclosures contained about twenty families. A bundle of fern, with goat-skin spread over it, served them for a bed, and for bed-cloaths and coverings.

ings they used dressed goat skins to keep them warm. Before they offered the breast to a new-born child, they gave it fern roots roasted, bruised, and mixed with butter; and at present they give them flour and barley-meal roasted, and mixed with bruised cheese.

The natives usually bake the flesh of sheep, goats, and hogs; and as they had no kind of grain, their bread was made of fern roots, of which, with milk and butter, the principal part of their diet was composed.

One king governed them all; and having never any occasion to go to war, had no warlike weapons: they indeed carried long staves; but these were only to assist them in travelling; for the country being so rocky, as to make it necessary frequently to leap from one stone to another, this they performed by means of these poles.

Polygamy was not allowed; but they had no restrictions with respect to their marriages, except a man's not being allowed to marry his mother or sister; for every man might take the woman he liked best, and whose consent he could obtain, without the least regard to rank or nobility. Indeed all, except the king, were in this respect upon an equality: the only distinction among them consisted in the number of their flocks. It was usual for the man, when he chose a wife, to make a present of cattle to her father, according to his ability, in return for the favour of letting him have his daughter. The king received no particular tribute from his subjects; and every one made him a present of cattle; for they were not obliged to give him any thing, but according to their pleasure or circumstances. At a feast, they killed one or two fat lambs, according to the number of their guests: these they placed in a vessel on the ground, sitting round it in a circle, and never rising till they had eaten the whole. These feasts are still continued among their descendants. If a person fell sick, they rubbed his body all over with butter and sheep's marrow, covering him well up to keep him warm; but when a man happened to be wounded, they burned the part affected, and afterwards anointed it with butter. They buried their dead in caves; and if the deceased was a man of wealth, they interred him in his cloaths, and put a board at his feet, and the pole he used to travel with at his side; and, in order to prevent his being devoured by ravens, they closed the mouth of the cave with stones.

Murder and theft were the only crimes for which they inflicted corporal punishment. The murderer was put to death in the same manner as he had killed the deceased; and the thief, for the first offence, was punished with the loss of one of his eyes, and for the second, of the other. This was done that he might not see to steal any more. The office of executioner on these occasions, was performed by a particular person set apart for that purpose.

As to their religion, they worshipped two deities, one of whom was male, the other female; the male was named Eraoranzan, and was the object of the men's adoration; the other, worshipped by the women, was called Moneyba. They had no images, or visible representations of these deities; nor did they ever sacrifice to them, but only prayed to them in their necessities, as when they wanted rain to bring up the grass for the subsistence of their cattle, &c. The natives pretended, that when the gods were inclined to do them good, they came to the island, and alighted on two great rocks, which are in a place to which they gave the name of Ventayca, where they received the petitions of the people; and afterwards returned to their celestial abode; these rocks are now called by the Spaniards Los Antillos de los Antiquos, or the hills of the antients.

We shall now give a particular description of the present natives of Canaria, Teneriffe, Palma, Gomera, and Ferro, with an account of their persons, dress, &c. previous to which it will be necessary to observe, that the descendants of this mixed nation are at present denominated Spaniards, whose language is that of the Castilian, which the gentry speak in perfection; but the peasants, in the remote parts of the islands, in an

almost unintelligible manner, so that they are scarcely understood by strangers.

The greatest part of the natives are small of stature, well made, and have good features; but they are more swarthy than the inhabitants of the southern parts of Spain; their eyes, however, are fine, large, and sparkling, and their countenances exceedingly expressive; but the old people have a very disagreeable aspect. People of distinction wore in common a camblet cloak of a dark red or black colour, a linen night-cap, bordered with lace; and a broad flouched hat. When they pay visits, a coat, sword, and white peruke are added, the latter of which forms a very odd contrast to their dusky complexions, and what is still more singular, they keep their large flouched hat upon their heads always in the house; but when they are out of doors, they carry them under their arm. Neither do they put on their perukes, upper coats, or swords, but when they walk in procession, pay formal visits, or go to church, on high festivals. The lower class of people wear their own black, bushy hair, and tuck some of it behind the right ear; and their principal garment is a white loose coat with a friar's cape, and girded round the middle with a sash. This garment is long and narrow, and made of the wool of their own sheep.

Women of inferior rank wear a piece of gauze on their heads, which falls down the shoulders, is pinned under the chin, and covers the neck and breast. A part of their dress is a broad-brimmed flouched hat, but they use this with more propriety than the men; for abroad they wear it upon their heads, whereby their faces are screened from the scorching beams of the sun. They throw a mantle over their shoulders, the goodness of which is in proportion to the condition of the wearer. They wear jackets instead of stays, and are all very fond of a great number of petticoats. The principal ladies of Grand Canaria and Teneriffe dress after the fashion of France and England, and pay visits in chariots; but none walk the streets without being veiled, though some are so careless in the use of their veils, that they take care to let their faces and necks be seen. Some ladies have their hair curiously plaited, and fastened to the crown of their head with a gold comb. Their mantles are very rich, and they wear a profusion of jewels; but they render their appearance ridiculous to strangers, from that clumsiness of dress, and awkwardness of gait, which is observable in both sexes.

The poorer sort of people are afflicted with many loathsome disorders, and are naturally very filthy; the gentry, however, affect great delicacy. Both sexes go every morning to hear mass; and most of them go before they take any refreshment. Their breakfast is usually chocolate: they dine at noon: and shut up the doors till three o'clock. People in good circumstances have four courses brought to table. The first dish consists of soup made of beef, mutton, pork, bacon, potatoes, turnips, carrots, onions, and saffron, stewed together, with thin slices of bread put into the dish. The second course consists of roasted meat, fowls, &c. The third is the olio, or ingredients of which the soup was made. After which, comes the desert, consisting of fruit and sweet-meats. The company drink freely of wine, or wine and water, while at dinner; but have no wine after the cloth is removed. While drinking, their toasts are much like ours. When dinner is over, a large silver dish, filled with water, is set upon the table; when the whole company, all at once, wash in it; and then a servant, who stands at the lower end of the table, cries, "Blessed and praised be the most holy sacrament of the altar, and the clear and pure conception of the most holy virgin, conceived in grace from the first instant of her natural existence. Ladies and gentlemen, much good may it do you!" After which, making a low bow to the company, he retires. They then rise, and each goes to his apartment, to take a nap for about an hour; which proves a great refreshment in this warm climate. Those of higher stations have generally a friar for one of their guests, who we may suppose is the confessor to some of the family, and frequently behaves with great rudeness; yet neither the

master of the house, nor any of the company, chuse to take much notice of it. Mr. Glas was once invited to dine with a gentleman, where a Franciscan friar made one of the company; but no sooner had they begun to eat, than the friar asked him if he was a christian? He answered, that he hoped so. He was then desired to rehearse the Apostle's creed; but answering, that he knew nothing about it, the reverend father stared full in his face, and exclaimed, "O thou black ass!" Offended at this piece of ill manners, our author asked, What he meant by treating him in that manner? When the friar only answered by repeating the abuse; the master of the house endeavoured in vain to persuade him to give over; but as the person did not at that time understand Spanish so well as to express himself fluently, he arose and left the house, after telling the gentleman, that he saw he was unable to protect him from insults at his own table. They treat with chocolate and sweet-meats in the morning and evening visits; but in the summer evenings with snow-water. People sup between eight and nine, and retire to rest soon after. The diet of the common people consists of gossio, fruit, and wine, with salt-fish brought from the coast of Barbary. Some think their being subject to the itch, is owing to their eating so much of this last food. In the summer season fresh fish is pretty plentiful, but more scarce and dear at other times of the year.

People of rank here have houses two stories high, which are handsome square buildings, of stone and mortar, with an open court in the middle like our public inns in England, and like them have balconies running round, which are on a level with the floor of the second story. The street-door is placed in the middle of the front of the house, and within that door is a second, the space between them being the breadth of the rooms of the house. The court-yard, which is on the inside, is large or small according to the size of the building, and is usually paved with flags, pebbles, or other stones. In the centre of the court is a square or circular stone-wall about four feet high, filled with earth, in which are commonly planted orange, banana, or other trees common in these parts. The lower story of each quarter of the house consists entirely of store-rooms, or cellars. The stairs leading to the second story usually begin at the right or left hand corner of the entrance of the court, and consist of two flights of steps, which lead into the gallery, from which one may enter any room on the second story. The principal apartments are generally in that quarter of the house facing the street, which contains a hall with an apartment at each end. These rooms are the whole breadth of the quarter, and the hall is twice the length of any of the apartments at its extremities. The windows of these rooms are formed of wooden lattices, curiously wrought; none of them looking inwards to the court; but they are all in the outside wall. Some great houses have balconies in the middle of the front, on the outside above the gate, equal with the floor of the second story; and some have a gallery which runs from one end of the front to the other, but the outside of the house has seldom any. They white wash all the apartments; and those at the extremities of the great halls, with some of the rest, are lined with fine mats about five feet high, and the floor is sometimes covered with the same. The sides of the windows of all the rooms are lined with boards to prevent people's cloaths being whitened; for they commonly sit in the window, there being benches on each side of it for that purpose; and when the master of the house intends to shew a stranger respect, he always conducts him to the window, to converse with him. The great hall, and the walls of some of the apartments, are hung with paintings, representing the virgin, the twelve apostles, saints, and martyrs, usually drawn as large as life, and distinguished by some circumstance of their history. Thus St. Peter is usually represented looking at a cock and weeping, and a great bunch of keys always hangs at his girdle. St. Anthony preaching to the fishes, is one of their favourite paintings. Their beds have seldom any curtains, for these they consider as receptacles for fleas and bugs, which

abound here extremely. They chiefly use mattresses spread on the floor upon fine mats; besides the sheets, there is a blanket and above that a silk quilt. The sheets, pillows, and quilt are frequently fringed or pinked, like the shrouds used for the dead with us. There is a place, in a particular apartment, raised a step higher than the floor, covered with mats or carpets; and there the women generally sit together upon cushions, both to receive visits from their own sex, and give directions concerning their household affairs. The houses of the peasants and lower sort of people, though only one story high, are built of stone and lime, and the roofs either thatched or tiled. These are generally neat, clean, and commodious. Indeed there is but little dirt or dust in these islands to makethem uncleanly; for the ground is mostly rocky, and seldom wet, from the almost continual fine weather.

The deportment of the natives is grave, but at the same time tempered with great quickness and sensibility; the women, in particular, are remarkable for their sprightliness, and vivacity of their conversation, which is said greatly to exceed that of the English, French, or northern nations. The great families in these islands would be highly offended should any one tell them, they are descended from the Moors, or even from the ancient inhabitants of these islands; yet it would not perhaps be difficult to prove, that most of their customs have been handed down to them from those people. The gentry boast much of their birth, and indeed that they are descended from the best families in Spain, there is no reason to doubt.

They have the utmost contempt for the employment of a butcher, taylor, miller, or porter. It is not indeed very surprising, that they should not have any great esteem for the profession of a butcher, or that the employment of a taylor should be considered as somewhat too effeminate for a man; but it is difficult to imagine why millers and porters should be despised, especially the former; but it must be considered, that the millers here are generally esteemed great thieves; and as the master of every family sends his own corn to be ground, unless it be narrowly watched, the miller will take too much toll. It is said that when any criminal is to suffer death, and the executioner happens to be out of the way, the officers of justice have the power of seizing the first butcher, miller, or porter they can find, and of obliging him to discharge that office; such is their dislike to persons of these occupations. Mr. Glas, once touching at the island of Gomera to procure fresh water, hired some poor ragged fishermen to fill the water casks, and bring them on board; but some time after, going to the watering place to see what progress they had made, he found the casks full, and all ready for rolling down to the beach, with the fishermen standing by, and talking together, as if they had nothing farther to do. He reprimanded them for their laziness in not dispatching the business in which he had employed them; when one of them, with a disdainful air, replied, "What do you take us to be, Sir?" "Do you imagine we are porters? No, Sir, we are sea-men." Notwithstanding all his intreaties and promises of reward, he was unable to prevail upon any of them to roll the cask to the water side; but was at last obliged to hire porters, to do the business. But the gentry of these islands, though for the most part poor, yet are extremely polite and well bred, the very peasants and labouring people have a considerable share of good manners, with little of that surly rusticity which is too common among the lower class of people in England; yet they do not seem to be abashed in the presence of their superiors. A beggar asks charity of a gentleman, by saying, "For the love of God, Sir, please to give me half a rial;" and if the other gives him nothing, he returns, "For the love of God, I beg your worship's pardon," and then departs.

The common people and servants here are much addicted to private pilfering, for which they are usually punished by being discharged the service, beaten, or imprisoned for a short time. Highway robberies are seldom or ever known; but murder is more common than

than in England; and they have no notion of duels, for they cannot imagine that because a man has the courage to fight, he thereby atones for the injury done to another, or that it ought to give him a right to do him a greater. When the murderer has killed a man, he flies to a church for refuge, till he can find an opportunity to escape to another island; and if he had been greatly provoked or injured by the deceased, and did not kill him designedly, every body will be ready to assist him to escape, except the near relations of the person who has lost his life; yet quarrels are far from being frequent here, which may be owing to the want of taverns and other public houses, their polite behaviour, the little intercourse there is between them, and their temperance in drinking. Persons of the lower class fight in public, but if one person puts another into a violent passion, the injured party, if able, takes his revenge in the best manner he can, till he thinks he has had satisfaction, without any regard to the equity of the method he uses for this purpose.

The inhabitants of the Canary islands are in general extremely temperate; or at least, if they are otherwise, it is in private only; for nothing can be a greater disgrace there, than to be seen drunk; and a man who can be proved a drunkard, is not permitted to give evidence, or take his oath, in a court of judicature. Hence those that are fond of liquor, intoxicate themselves in their chambers, and then lie down, in order to sleep till they are sober. Those of all ranks in these islands are extremely amorous; but their notions of love are pretty singular; which may perhaps be attributed to the want of innocent freedom between the sexes. However, they do not seem to be inclined to jealousy, any more than the English or French. It is usual for young people here to fall in love at sight; and if the parties agree to marry, but find their parents averse to their union, they complain to the curate of the parish, who goes to the house where the girl lives, and endeavours to persuade them to agree to her marriage; but if they refuse to consent to their union, he takes her away before their faces, without their being able to hinder him, and either places her in a convent, or with some of her relations, where she must remain till they consent to her marriage. We have been informed that a lady will sometimes send a man an offer of her person in an honourable way; if he declines it, he keeps the matter secret till death, should he do otherwise, he would be looked upon by all people in the most despicable light. Young men are not allowed to court the youth of the other sex without an intention to marry them; for if a woman can prove that a man has, in any instance, endeavoured to engage her affections, she can oblige him to marry her. This, like many other good laws, is abused; for loose women taking advantage of it, frequently lay snares to entrap the simple and unwary; and sometimes worthless young men, form designs upon the fortunes of ladies, without having the least regard for their persons: there are not, however, many mercenary lovers in this part of the world, their notions in general being too refined and romantic to admit the idea of that passion being made subservient to their ambition or interest; and yet there are more unhappy marriages here than in the countries where innocent freedoms being allowed between the sexes, lovers are not so blinded by their passions, as not to perceive the frailty and imperfections of their mistresses. On the death of a man's wife, it is usual for some of his relations to come to his house, and reside with him for some time, in order to divert his grief, and do not leave him till another relation comes to relieve the first, the second is relieved by a third, and thus they succeed each other for the space of a year.

Each of the Canary islands, as well as every town and family, hath a peculiar tutelary saint for its patron, whose day is celebrated as a festival, by a sermon preached in honour of the saint, and a service suited to the occasion. On these days, the street near the church is strewn with flowers and leaves, a multitude of wax candles are lighted, and a considerable number of fireworks played off.

A kind of fair is generally held on the eve of these festivals, to which the people of the adjacent country resort, and spend the greatest part of the night in mirth and dancing to the sound of the guitar, accompanied with the voices not only of those who play on that instrument, but by those of the dancers. The dances practised here are farabands and folias, which are slow dances; those which are quick are the canario, first used by the Canarians; the fandango, which is chiefly practised by the vulgar; and the rapetes, which nearly resembles our hornpipe. Some of these dancers may be termed dramatic, as the men sing verses to their partners, who answer them in the same manner. Most of the natives of these islands can play on the guitar, and they have in general excellent voices.

For the entertainment of the populace, plays are acted in the streets, at the feasts of the tutelary saints of Teneriffe, Canaria, and Palma; but the performers cannot be supposed to rise to any degree of perfection, as they are not professed actors, and only some of the inhabitants of the place seem to have a natural turn for acting.

The gentry frequently take the air on horseback; but when the ladies are obliged to travel, they ride on asses, and instead of a saddle, they use a kind of chair, in which they sit very commodiously. The principal roads are paved with pebble-stones, like those used in the streets of London. There are a few chariots in Canaria, the town of Santa Cruz, and the city of Laguna in Teneriffe; these are all drawn by mules, but they are kept rather for show than use; for the roads are not proper for wheel carriages, being steep and rocky. The lower class of people divert themselves with dancing, singing, and playing on the guitar; likewise with throwing a ball through a ring placed at a great distance, cards, wrestling, and quoits. The peasants, particularly those of Gomera, have the art of leaping from rock to rock when they travel, which is thus performed: the long staff or pole used on these occasions, has an iron spike at the end of it, and when a man wants to descend from one rock to another, he aims the point of the pole at the place where he intends to alight, and then throws himself towards it, pitching the end of the pole so as to bring it to a perpendicular, and then slides down it to the rock on which he fixed it.

In the convents, children are taught reading, writing, Latin, arithmetic, logic, and other branches of philosophy. The scholars read the classics; but the Greek is never taught here, and is entirely unknown even to the students in divinity. They are particularly fond of civil law and logic, but the latter is chiefly preferred.

The people belonging to these islands have a genius for poetry, and compose verses of different measures, which they set to music. Some of their songs, and other poetical pieces, would be greatly esteemed in a country where taste for poetry prevails. Few of those books called profane (to distinguish them from those of a religious kind) are read here, since they cannot be imported into the island without being first examined by the inquisition; a court which nobody cares to have any concern with. The history of the wars in Granada is in every body's hands, and is read by people of all ranks; they have also some plays, most of which are very good. Thomas a Kempis, and the Devout Pilgrim, are in every library, and much admired. But the books most read by the laity are the Lives of the Saints and Martyrs, which may be considered as a kind of religious romances, stuffed with legends, and the most absurd and improbable stories.

With respect to the civil government of the islands of Canaria, Teneriffe, and Palma, which are called the king's islands, it will be proper to observe, in the first place, that the natives, on their submitting to the crown of Spain, were so far from being deprived of their liberty, that they were put on an equality with their conquerors, in which the Spaniards shewed great wisdom and policy; but how they came afterwards to act in a quite contrary manner in America, is hard to determine; perhaps they might be apprehensive, that if they

proceeded with too much rigour against them at first, they might in time be induced to shake off the yoke, and dispossess their tyrannical masters, which we are informed, by late events, has proved to be the case in South America, as the following piece of intelligence, published in September 1782, announces: "You have repeatedly heard it reported, that there was a rebellion in Chili and Peru, in South America; and though the Spaniards do all they can to keep it a secret, I can assure you, from undoubted authority, that all the mines in Peru and the city of *Pez*, which is situated in the interior part of the country, where they lodged their bars of gold and silver, and other valuables, are taken from them, and there were one hundred and fifty millions of *piastres* taken out of the strong chests. The natives will very soon have the whole country in their possession, for they destroy every white man, woman, and child, and even kill every one begot between a Spaniard and a native." But to return. After the conquest of the Canary Islands, the Spaniards incorporated with the natives in such a manner as to become one people with them, and in consequence of this political union, the king of Spain is able to raise in these islands more soldiers and seamen than in any other part of his dominions of three times their extent. The *alcade*, who is a justice of peace, is the lowest officer except the *alguazils*; there is one of them in every town or village of note. These magistrates are appointed by the royal audience of the city of *Palmas*, in *Canaria*; they hold their places only for a certain time, and, in cases of property, can take cognizance of no disputes where the value of what is contended for exceeds seventeen *rials*, or seven shillings sterling. Over these magistrates is the *alcade mayor*, who is appointed in the same manner as the other, and cannot decide any case relating to property, that exceeds the sum of two hundred dollars. From the decision of those magistrates, appeals lie to the *tiniente* and *corregidor*: the first of whom is a lawyer, and nominated by the royal audience; but the latter, who is appointed by the king, is not obliged to be a lawyer, yet must have a secretary, clerk, or assistant bred to the law. The *corregidor* generally holds his place five years, and sometimes longer. Few of the natives enjoy this honourable office, which is commonly filled by Spaniards. The proceedings of the *corregidor's* court, and in that of the *tiniente*, are the same; these courts seeming to have been originally intended as a check upon each other. Appeals are made from the *corregidor* and *tiniente* to the royal audience of *Grand Canaria*; a tribunal composed of three *oidores*, or judges, a regent, and fiscal, who are usually natives of Spain, and are always appointed by the king. The governor-general is president of this court, though he resides in *Teneriffe*. In criminal causes there is no appeal from their determination; but appeals are carried to the council or audience of *Seville* in Spain, in matters respecting property.

In the Canary Islands, the standing forces amount only to about an hundred and fifty men; but there is a militia of which the governor-general of the island is always commander in chief, and the officers, as colonels, captains, and subalterns, are appointed by the king. There are also governors of forts and castles, some of which are appointed by the king, and others by the twelve *regidores* of the islands, called the *cavildo*; some of the forts belong to the king, and the rest are under the direction of the *regidores*, or sub-governors, who also take care of the repair of the highways, prevent nuisances, and the plague from being brought into the island by shipping; for no man is allowed to land in these islands from any ship, till the master produces a bill of health from the last port, or till the crew have been examined by the proper officers. The royal revenue arises from the following articles: a third of the tithes, which scarcely amounts to a tenth part of them, the clergy appropriating almost the whole to themselves. This third part was given by the pope to the king of Spain, in consideration of his maintaining a perpetual war against the infidels. The second branch

consists in the monopoly of tobacco and snuff, which the king's officers sell on his account, no other persons being allowed to deal in those articles. Another branch of the revenue arises from the *orchilla-weed*, all of which in the islands of *Teneriffe*, *Canaria*, and *Palma*, belong to the king, and is part of his revenue; but the *orchilla* of the other islands belongs to their respective proprietors. The fourth branch consists of the acknowledgment annually paid by the nobility to the king for their titles, which amounts to a mere trifle. The fifth branch is a duty of seven per cent. on imports and exports: and the sixth duty on the *Canary West India* commerce. All these branches, the sixth excepted, are said not to bring into the king's treasury above fifty thousand pounds per annum, clear of the expences of government, and all charges relating thereto.

Having departed from *Madeira* on the 1st of August, on the 9th we crossed the Tropic of Cancer, and at nine in the morning came in sight of *Bonavista*, bearing S. W. by W. about two leagues. This day Capt. Cook made from the inspissated juice of malt three puncheons of beer. The proportion of water to juice was ten of the former to one of the latter. We had on board nineteen half barrels of inspissated juice, fifteen of which were made from wort that had been hopped before it was inspissated. This you may mix with cold water, in a proportion of one part of juice to eight of water, or one part to twelve; then stop it down, and in a few days it will be brisk and fit to drink; but the first sort, after having been mixed as above directed, will require to be fermented with yeast, in the manner as is done in making beer; however, we found this not always necessary, as we at first imagined. This juice would be a most valuable article at sea, could it be kept from fermenting, which it did at this time by the heat of the weather, and the agitation of the ship, that all our endeavours to stop it were in vain.

On Monday the 10th we passed the island of *Mayo*, on our starboard side, and at two P. M. came to an anchor, eighteen fathom water, in *Port Praya*, in the isle of *St. Jago*, one of the *Cape de Verdes*. An officer was sent on shore for leave to procure what refreshments we wanted, which was readily granted; and on his return we saluted the fort with eleven guns. Here both ships were supplied with plenty of good water. We also recruited our live stock, such as hogs, goats and poultry, some of which continued alive during the remainder of the voyage.

The *Cape de Verd* islands are situated in 14 deg. 10 min. N. latitude, and 16 deg. 30 min. W longitude. They were so called from a cape of the same name opposite to them, and were discovered by *Anthony Noel*, a *Genoese*, in the service of *Portugal*, in the year 1640, and are about twenty in number; but some of them are only barren uninhabited rocks. The cape took its name from the perpetual verdure with which it is covered. The *Portuguese* give them the name of *Les Ilhas de Verdes*, either from the verdure of the cape, or else from an herb called *sargasso*, which is green, and floats on the water all round them. His *Portuguese* majesty appoints a viceroy to govern them, who constantly resides in the island of *St. Jago*. The Dutch call them the *Salt Islands*, from the great quantities of that commodity produced in several of them. The principal of these are, 1. *May*, or *Mayo*; 2. *San Jago*, or *Saint James's*; 3. *Sal* or *Salt*; 4. *Buena*, or *Bono Vista*, or *Good Sight*; 5. *St. Philip's*, otherwise called *Fuego*, or the island of *Fire*; 6. *St. John*, or *San Juan*; 7. *St. Nicholas*; 8. *St. Vincent*; 9. *St. Anthony*; 10. *St. Lucia*; 11. *Brava*. Their soil is very stony and barren; the climate exceeding hot, and in some of them very unwholesome; however, the principal part of them are fertile, and produce various sorts of grain and fruits, particularly rice, maize, or *Indian wheat*, bananas, lemons, citrons, oranges, pomegranates, coconuts, and figs. They have also calavanes, a sort of pulse like French beans, and great quantities of pumpkins, on which the inhabitants chiefly subsist. They produce also two other fruits of a remarkable nature, viz.

viz. the custard apple, and the papah. The former of these is as large as a pomegranate, and nearly of the same colour. The outside husk, shell, or rind, is in substance and thickness between the shell of a pomegranate and the peel of a Seville orange, softer than the former, yet more brittle than the latter. The coat or rind is also remarkable for being covered with small regular knobs or risings; and the inside of the fruit is full of a white soft pulp, which in its form, colour and taste, greatly resembles a custard, from whence it received its name, which was probably first given it by the Europeans. It has in the middle a few small black stones, but no core, for the whole of it is entire pulp. The tree that bears this fruit is about the size of a quince-tree, and has long slender branches that spread a considerable way from the trunk. Only some of the branches bear fruit, for though these trees are large, yet in general such trees do not produce above twenty or thirty apples. The fruit grows at the extremity of these branches, upon a stalk about nine or ten inches long. The other fruit, called the papah, is about the size of a musk melon, and resembles it in shape and colour both within and without; only in the middle, instead of flat kernels, which the melons have, these have a quantity of small blackish seeds, about the size of pepper-corns, the taste of which is much the same as that spice. The tree on which this fruit grows, is about ten or twelve feet high; the trunk is thickest at the bottom, from whence it gradually decreases to the top, where it is very thin and taper. It has not any small branches, but only large leaves, that grow immediately on the stalks from the body. The leaves are of a roundish form, and jagged about the edges, having their stalks or stumps longer or smaller, as they grow nearer or farther from the top: they begin to spring out of the body of the tree at about six or seven feet high from the ground, the trunk being below that entirely bare, and the leaves grow thick all the way from thence to the top, where they are very close and broad. The fruit grow only among the leaves, and most plentiful where the leaves are thickest; so that towards the top of the tree the papahs spring forth from it in clusters. It is, however, to be observed, that where they grow so thick, they are but small, being no bigger than ordinary turneps; whereas those nearer the middle of the trunk, where the leaves are not so thick, grow to the first-mentioned size.

Various sorts of poultry abound in these islands, particularly curlews, Guiney hens, and flamingoes, the latter of which are very numerous. The flamingo is a large bird, much like a heron in shape, but bigger, and of a reddish colour; they go in flocks, but are so shy, that it is very difficult to catch them: they build their nests in shallow ponds, where there is much mud, which they scrape together, making little hillocks, like small islands, that appear about a foot and a half above the surface of the water. They make the foundations of these hillocks broad, bringing them up taper to the top, where they leave a small hollow pit to lay their eggs in: they never lay more than two eggs, and seldom less. The young ones cannot fly till they are almost full grown, but they run with surprising swiftness: their tongues are broad and long, having a large lump of fat at the root, which is delicious in its taste, and so greatly admired, that a dish of them will produce a very considerable sum of money. Their flesh is lean, and of a dingy colour, but it neither tastes fishy, nor any ways unpleasing. Here are also several other sorts of fowls, as pigeons and turtle doves; miniotas, a sort of land fowl, as big as crows, of a grey colour, and the flesh well tasted; crusias, another sort of grey-coloured fowl, almost as large as the former; these are only seen in the night, and their flesh is said to be exceeding salutary to people in a decline, by whom they are used. They have likewise great plenty of partridges, quails, and other small birds, and rabbits in prodigious numbers.

Many wild animals abound here, particularly lions, tigers and camels, the latter of which are remarkably large. There are also great numbers of monkeys, baboons, and civet-cats, and various kinds of reptiles.

The tame animals are horses, asses, sheep, mules, cows, goats and hogs; and here the European ships bound for the East Indies, usually stop to take in fresh water and provisions, with which they are always plentifully supplied.

Fish of various sorts abound in the sea, particularly dolphins, bonettas, mullets, snappers, silver fish, &c. and here is such plenty of turtle, that several foreign ships come yearly to catch them. In the wet season the turtles go ashore to lay their eggs in the sand, which they leave to be hatched by the heat of the sun. The flesh of the turtles, well cured, is as great a supply to the American plantations, as cod-fish is to Europe. The inhabitants go out by night and catch the turtles, by turning them on their backs with poles; for they are so large that they cannot do it with their hands.

In these islands are many European families, all of whom profess the Roman Catholic religion. The natives are all negroes, and much like their African neighbours, from whom they are supposed to be descended; though, as they are subject to the Portuguese, their own religion and language prevail among them. Both men and women are stout, and well limbed, and they are in general of a civil and quiet disposition. Their dress (particularly in the island of St. John) is very trifling, consisting only of a piece of cotton cloth wound round the waist. The women sometimes throw it over the head, and the men across the shoulders. Neither sex wear shoes or stockings, except on certain festivals. The men are particularly fond of wearing breeches, if they can get them, and are very happy if they have but a waistband and flap before, be they ever so ragged.

The island of Mayo, or May, obtained its name from its being discovered on the first of that month. It is situated in 15 deg. 5 min. N. latitude, near 300 miles from Cape Verd, and is about 17 miles in circumference. The soil is in general very barren, and water scarce: however, here are plenty of cows, goats, and asses; and also some corn, yams, potatoes and plantains. The trees are situated on the sides of the hills, and the natives have some water-melons and figs. The sea likewise abounds with wild fowl, fish and turtle. There grows on this island, as well as on most of the others, a kind of vegetable stone, extremely porous, of a greyish colour, which shoots up in stems, and forms something like the head of a cauliflower.

On the west side of the island is a sand-bank that runs two or three miles along the shore, within which is a large salina, or salt-pond, encompassed by the sand-bank, and the hills beyond it. The whole salt-pond is about two miles in length, and half a mile wide; but the greater part of it is generally dry. The north end, which is always supplied with water, produces salt from November till May, those months being the dry season of the year. The waters yield this salt out of the sea, through a hole in the sand-bank, and the quantity that flows into it is in proportion to the height of the tides: in the common course it is very gentle, but when the spring tides arise, it is supplied in abundance. If there is any salt in the pond, when the flush of water comes in, it soon dissolves; but in two or three days after it begins to congeal, and so continues till a fresh supply of water from the sea comes in again. A considerable trade for salt is carried on by the English, and the armed ships destined to secure the African commerce, afford the vessels thus engaged their protection. The inhabitants of the island are principally employed in this business during the season: they rake it together, and wheel it out of the pond in barrows, from whence they convey it to the sea-side on the backs of asses, which animals are very numerous here. The pond is not above half a mile from the landing-place; so that they go backwards and forwards many times in the day; but they restrain themselves to a certain number, which they seldom exceed.

There are several sorts of fowl, particularly flamingoes, curlews, and Guiney hens. Their chief cattle are cows, goats, and hogs, which are reckoned the best in all the Cape de Verd islands. Besides the fruits above-mentioned, they have calavanes and pumpkins, which are the common food of the inhabitants.

The

The inhabitants of this island live in three small towns, the principal of which is called Pimont, and contains two churches, with as many priests; the other is called St. John, and has one church; and the third, which has a church also, is called Lagos. The houses are very mean, small, and low; they are built with the wood of the fig tree (that being the only one fit for the purpose that grows on the island) and the rafters are made of a sort of wild cane which grows here.

The Portuguese governor of St. Jago grants the patent to the negro governor of this island, whose situation is tolerably advantageous, as every commander that lades salt here is obliged to compliment him with a present. He spends most of his time with the English in the salting season, which is his harvest, and a very busy time with all the natives. These people have not any vessels of their own, nor do any Portuguese ships come hither, so that the English are the chief on whom they depend for trade; and though they are subjects of Portugal, they have a particular esteem for the English nation. Asses are also a great commodity of trade here; and are so plentiful, that several European ships from Barbadoes and other plantations, come annually to freight with them to carry thither.

The island of St. Jago, or St. James's island, is situated about four leagues to the westward of Mayo, between the 15th and 16th deg. N. lat. and in the 23d of W. long. This island is the most fruitful and best inhabited of all the Cape de Verd islands, notwithstanding it is very mountainous, and has a great deal of barren land in it. The principal town is called after the name of the island, and is situated in 15 deg. N. latitude. It stands against the sides of two mountains, between which there is a deep valley two hundred yards wide, that runs within a small space of the sea. In that part of the valley next the sea is a straggling street, with houses on each side, and a rivulet of water in the bottom, which empties itself into a fine cove or sandy bay, where the sea is generally very smooth, so that ships ride there with great safety. A small fort stands near the landing place from this bay, where a guard is constantly kept, and near it is a battery mounted with a few small cannon.

The town of St. John contains about three hundred houses, all built of rough stone, and it has one small church and a convent. The inhabitants of the town are in general very poor, having but little trade. Their chief manufacture is striped cotton cloth, which the Portuguese ships purchase of them, in their way to Brasil, and supply them with several European commodities in return.

A tolerable large town is on the east side of the island, called Praya, where there is a good port, which is seldom without ships, especially in peaceable times. Most of the European ships bound to the East Indies touch at this port to take in water and provisions, but they seldom stop here on their return to Europe. The town of Praya does not contain any remarkable building, except a fort, situated on the top of a hill, which commands the harbour. When the European ships are here, the country people bring down their commodities to sell to the seamen and passengers; these articles generally consist of bullocks, hogs, goats, fowls, eggs, plantains, and cocoa-nuts, which they exchange for shirts, drawers, handkerchiefs, hats, waistcoats, breeches, and linen of any kind.

The port of Praya, a small bay, is situated about the middle of the south side of the island of St. Jago, in the latitude of 14 deg. 53 min. 30 sec. N. and 23 deg. 30 min. W. longitude. It is discovered, especially in coming in from the east, by the southernmost hill on the island, and which lies west from the port. The entrance of the bay is formed by two points, rather low, being W. S. W. and E. N. E. half a league from each other. Near the west point are sunken rocks, whereon the sea continually breaks. The bay lies in N. W. about half a league. We watered at a well, behind the beach, at the head of the bay. The water is scarce, but it is difficult to get it aboard, on account of a great surf on the beach. The refreshments to be procured here will

No. 14.

be found in the course of our account of the islands. Other articles may be purchased of the natives in exchange for old cloaths, &c. Bullocks can only be bought with money; the price twelve Spanish dollars per head, weighing between 250 and 300 pounds; but the sale of them is confined to a company of merchants, to whom this privilege is granted, and who keep an agent residing on the spot. The bay is protected by a fort well situated for the purpose of defence.

The complexion of the natives of this town and St. Jago inclines to black, or is at least of a mixed colour, except some few of the better sort that reside in the latter, among whom are the governor, the bishop, and some of the padres (fathers) or priests. The people of St. Jago town, as they live under the governor's eye, are pretty orderly, though generally very poor, having little trade; but those about Praya are naturally of a thievish disposition, so that strangers who deal with them must be very careful, for if they see an opportunity, they will steal their goods, and run away.

Sal, or Salt, is the windwardmost of all the Cape de Verd islands, and is situated in the 17th deg. of N. lat. and 5 deg. 18 min. W. long. from the Cape. It received this name from the great quantity of salt naturally produced here from salt water, that from time to time overflows part of the land, which is mostly low, having only five hills, and stretches from north to south about eight or nine leagues, but it does not exceed one league and a half in breadth. In this island are only a few people. These live in wretched huts near the sea-side, and are chiefly employed in gathering salt for those ships that occasionally call here for that article. The best account of this barren island is given us by Capt. Roberts, who landed here, and relates the following story, which he says he was told by one of the blacks that resided in it. "About the year 1705, not long before I went ashore, the island was entirely deserted for want of rain by all its inhabitants except one old man, who resolved to die on it, which he did the same year. The drought had been so extreme for some time, that most of the cows and goats died for want of sustenance, but rain following, they increased apace, till about three years after they were again reduced by a remarkable event. A French ship coming to fish for turtle, was obliged, by stress of weather, or from some other cause, to leave behind her thirty blacks, which she had brought from St. Antonio to carry on the fishing. These people, finding nothing else, fed mostly on wild goats, till they had destroyed them all but two, one male and the other female; these were then on the island, and kept generally upon one mountain. A short time after an English ship (bound for the island of St. Mayo) perceiving the smoke of several fires, sent their boat on shore, and thinking they might be some ship's company wrecked on the island, put in there; when they understood the situation of the people, they commiserated their case, took them all in, and landed them on the island from whence they were brought."

The island of Buena Vista, or Bona Vista, thus named from its being the first of the Cape de Verd islands discovered by the Portuguese, is situated in the 16th degree of N. lat. two hundred miles W. of the coast of Africa, and is twenty miles long, and twelve broad, mostly consisting of low land, with some sandy hills, and rocky mountains. It produces great quantities of indigo, and more cotton than all the other Cape de Verd islands; yet there is not one of them where there are fewer cotton cloths to be sold: for the natives will not even gather the cotton before a ship arrives to buy it; nor will the women spin till they want it. They have, in general, the same animals as in the other islands, with plenty of turtle, and many sorts of fish. When the English land to take in a lading of salt, they hire men and asses to bring it down to the sea; for which they pay them in biscuits, flour, and old cloaths. This island had also formerly a pretty good trade for horses and asses, which are the best of all that are upon these islands. The people are very fond of silk, with which they work the bosoms of their shirts, shifts, caps, women's waistcoats, &c.

2 H

The

The people of this island prefer the English dress to their own; for most of them have suits of cloaths bought of the English, and have learned to make cotton cloth to imitate the European fashion. The women have one, two, or three cotton cloths wrapped about them like petticoats, tied on with a girdle about the hips, and sometimes without a girdle. Their shifts are made like a man's shirt, but so short, as scarcely to reach to the girdle; the collar, neck, and waistbands, of the young people of some rank, are wrought in figures with silk in various colours in needlework; but the old and the poor have theirs worked with blue cotton thread. Over their shifts they wear a waistcoat, with sleeves to button at the arms, not above four inches deep in the back part, but long enough before to tie with strings under their breasts. Over all they have a cotton cloth in the manner of a mantle; those of the married women are generally blue, and the darker the colour the richer it is reckoned; but the maidens, and gay young wives, and widows, wear blue and white, some spotted and some figured. They, however, rather choose, if they can get them, linen handkerchiefs wrought on the edges, and sometimes only on the corners, with red, green, and blue silk; the first being the colour they most admire. They wear neither shoes nor stockings, except in holidays; and, indeed, at other times the women have generally only a small cotton cloth wrapped round their waist, and the men a ragged pair of breeches; to which, if there be but a waistband, and a piece hanging to it before to hide what modesty teaches them to conceal, they think it sufficient. The people of Bona Vista are fond of the English, and most of them can speak a little of their language.

St. Philip, called also Fuego, or the Isle of Fire, received this latter name from a very large mountain, which frequently emits great quantities of fire and sulphur. It is situated in fifteen deg. twenty min. N. lat. and six deg. fifty-four min. W. from the Cape; is the highest of all the Cape de Verd islands, and appears at a distance like one continued mountain. On the west side of it there is a road for shipping, near a small castle situated at the foot of a mountain, but the harbour is not safe, on account of the violent beating of the waves. The wind blows very strong round this island, and the shore being on a slant, the water is very deep, so that, except very near the castle, no ground is to be found within the lines. In this island water is very scarce, there not being a single running brook throughout it; notwithstanding which it is tolerably fertile, and produces great quantities of pumpions, water-melons, festroons, and maiz, but no bananas or plantains, and scarce any fruit trees except wild figs; however, in some of their gardens, they have guava-trees, oranges, lemons, and limes. They have likewise some good vineyards, but they make no more wine than just what they use themselves. Most of the inhabitants are negroes, there being an hundred blacks to one white; they are all Roman Catholics, though some of them introduce many pagan superstitions into that religion. They breed great numbers of mules, which they sell to other nations, and make cotton cloths for their own use.

The Portuguese, on their first peopling this island, brought with them negro-slaves, and a stock of cows, horses, asses, and hogs; but the king himself furnished the place with goats, which ran wild in the mountains. There are many of the latter animals here at this time, and the profits of their skins is reserved to the crown of Portugal. An officer, called captain of the mountains, has the management of this revenue, and no person dares, without his licence, kill any one of them.

St. John's is situated in fifteen degrees twenty-five min. N. lat. and seven deg. two min. W. of Cape Verd, and is very high and rocky. It has more salt-petre than any of these islands; this is found in several caves, covering the sides like a hoar-frost, and in some hollow rocks, like icicles, as thick as a man's thumb. This island abounds with pumpions, bananas, water-melons, and other fruit, and also with fowls, goats, asses, hogs,

&c. There are plenty of fish in the seas about St. John's, and most of the fish here have remarkable sharp teeth; and they generally use crabs and insects for baits. Fishing is the principal employment of the natives; hence they miss no opportunities of wrecks, or, when ships touch here, to procure all the bits of iron they can.

In this island, the salt is made by the heat of the sun, which shining on the water in the holes of the rocks, is thereby turned, and sometimes lies two feet thick. The natives usually go and get a quantity of salt early in the morning, fish the greatest part of the day, dry, split, and salt their fish in the evening, and, having heaped them up let them lie in the salt all night. On the ensuing morning they spread them out to dry in the sun, and they are fit to use when wanted.

The baleas, a sort of whale or grampus, is very common near this island; and some affirm, that ambergris is the sperm of this creature. A great quantity of ambergris was formerly found about this island, but it is less plentiful at present. Some years before Capt. Roberts was here, Juan Carneira, a Portuguese, who was banished from Lisbon for some crime, having procured a little ship or shallop, traded among these islands: meeting at length with a piece of ambergris of an uncommon bigness, he not only procured his liberty, and leave to return before the term of his exile was expired, but had sufficient left, after defraying all charges, to put himself into a comfortable way of living, and a rock near to which he found the ambergris, is called by his name to this day.

The natives of this island do not amount to above two hundred souls, and are quite black. They are the most ignorant and superstitious of any of the inhabitants of these islands. But in their disposition they are simple and harmless, humble, charitable, humane, and friendly; pay a particular respect to their equals, reverence their elders, are submissive to their superiors, and dutiful to their parents. People wear in common only a slip of cotton fastened to a string before, which passing between the thighs, is tied to the same string behind; but when full dressed they also wear a piece of cotton cloth, (spun and wove by themselves) which the men hang over their shoulders, and wrap round their waists, while the women put it over their heads, and then wrap it about their bodies; and on both of them it extends to the calf of the leg, or lower. They use in fishing, long canes for rods, cotton lines, and bent nails for hooks. As to their hunting, the governor having the sole privilege of killing the wild goats, none dare hunt without his consent. This was a law made by the Portuguese when they peopled these islands from the coast of Africa, in order to prevent the entire loss of the breed.

When a general hunt is appointed by the governor, all the inhabitants are assembled, and the dogs, which are between a beagle and a greyhound, are called. At night, or when the governor thinks proper to put an end to the sport, they all meet together, and he parts the goats flesh between them as he pleases, sending what he thinks proper to his own house, with all the skins; and after he comes home, he sends pieces to those who are old, or were not out a hunting; and the skins he distributes amongst them as he thinks their necessities require, reserving the remainder of them for the lord of the soil. This is one of the principal privileges enjoyed by the governor; who is also the only magistrate, and decides the little differences that sometimes happen among the people. Upon their not submitting to this decision, he confines them till they do, in an open place walled round like a pound: but, instead of a gate, they generally lay only a stick across the entrance, and those innocent people will stay there without attempting to escape, except when overcome by passion, and then they rush out in a rage; but these are soon caught again, tied hand and foot, and a centinel set to watch them, till they agree with their antagonist, ask the governor's pardon for breaking out of his prison, and have remained there as long as he thinks they have deserved. Nay, if one kills another, which hardly happens in an age,

age, the governor can only confine him till he has pacified the relations of the deceased, by the mediation of his friends, who are bound for the criminal's appearance, in case a judge should be ever sent from Portugal to execute justice; but imprisonment is here reckoned such a scandal, that it is as much dreaded as Tyburn was by criminals here.

About forty-five miles from the island of Salt is St. Nicholas Island, the N. W. point of which is in 17 deg. 10 min. N. latitude, and 6 deg. 52 min. W. longitude from Cape de Verd. It is the largest of all the Cape de Verd islands, except St. Jago. The land is high, and rises like a sugar-loaf, but the summit of the most elevated part is flat. The coast of this island is entirely clear from rocks and shoals. The bay of Paraghi is very safe, but the other roads are insecure till the trade winds are settled. Here is a valley which has a fine spring of water in it, and many persons employ themselves in supplying different parts with that useful article, with which they load asses, and carry it a considerable way at a cheap rate. Water may likewise be obtained in almost any part of the island, by digging a well.

The town of St. Nicholas is the chief place in the island; it is close built and populous, but all the houses, and even the church, are covered with thatch. Capt. Avery, the celebrated pirate, having once received some offence from the inhabitants, burnt this town; but it was afterwards rebuilt, much in the same manner, and to the same extent as before.

The people are nearly black, with frizzled hair. They speak the Portuguese language tolerably well, but are thievish and blood thirsty. The women here are more ingenious, and better housewives than in any other of the Cape de Verd islands. Most families have horses, hogs, and poultry; and many of the people of St. Nicholas understand the art of boat-building, in which the inhabitants of the other islands are deficient. They likewise make good cloths, and even cloaths, being tolerable tailors, manufacture cotton quilts, knit cotton stockings, make good shoes, and tan leather. They are strong Roman Catholics, but their dispositions are so obdurate, that their priests find it very difficult to rule them. This island abounds in oranges, lemons, plantains, bananas, pompions, musk, water-melons, sugar-canes, vines, gum-dragon, festroons, maize, &c.

The island of St. Vincent is under 18 deg. of N. latitude, two leagues to the west of St. Lucia, and about forty-three leagues distant from the Isle of Salt, W. and by N. It is five leagues in length. On the N. W. of it there is a bay a league and a half broad at the entrance, surrounded with high mountains, and stretching to the middle of the island. This bay is sheltered from the westerly and north-westerly winds, by the high mountains of the isle of St. Vincent; so that this is the safest harbour of any in all these islands; and yet it is difficult of access, because of the furious winds that blow with the utmost impetuosity from the mountains along the coast. There are several other small bays on the south-side of the island, where ships may anchor, and thither the Portuguese generally go to load hides. The S. E. side of this island is a sandy shore, but there is not a drop of water on the hills, nor even in any of the deep valleys, except one, in which fresh water is seen to spout out of the ground on digging a little.

St. Anthony is the most northward of all the Cape de Verd islands, and lies in 18 deg. N. latitude, seven miles from St. Vincent, with a channel between them, which runs from S. W. to N. E. Here are two high mountains on this island, one of which is nearly as high as the pike of Teneriffe, and seems always enveloped in clouds. The inhabitants are about five hundred in number; and on the N. W. side of the island there is a little village, consisting of about twenty houses or cottages, and inhabited by near fifty families of negroes and white people, who are all wretchedly poor, and

speak the Portuguese language. On the north-side of the island there is a road for shipping, and a collection of water in a plain lying between high mountains, the water running from all sides in the rainy season; but in the dry season the people are greatly distressed for water. The principal people here are a governor, a captain, a priest, and a schoolmaster, all of whom take much upon themselves, so that the people have some jingling verses concerning them, which imply, that the governor's staff, the beads of the priest, the schoolmaster's rod, and the captain's sword, give them a licence to feast on the natives, who serve as slaves to support their luxury and grandeur.

St. Lucia lies in latitude 17 deg. 18 min. N. It is high land, full of hills, and is about eight or nine leagues long. On the S. E. end of it are two small isles, very near each other. On the E. S. E. side is the harbour, where the shore is of white sand: here lies a small island, round which there is a very good bottom, and ships may ride at anchor in twenty fathom water, over against the island of St. Vincent.

Brava or the Savage, or the Defart Island, is about four leagues to the S. W. of Fuego. There are two or three small islands to the north of it. The best harbour lies on the S. E. side of the island, where ships may anchor next to the shore in fifteen fathom water. There is an hermitage and an hamlet just above the harbour. On the west-side of the island there is a very commodious road for such ships as want to get water.

On Friday the 14th of August, both ships having got on board a supply of refreshments and provisions, we weighed anchor, put to sea, and continued our voyage to the cape of Good Hope. On Sunday the 16th, in the evening, a luminous fiery meteor made its appearance; it was of a bluish colour, an oblong shape, and had a quick descending motion. After a momentary duration, it disappeared in the horizon; its course was N. W. We observed a swallow following our vessel, and making numberless circles round it, notwithstanding our distance from St. Jago was between fifty and sixty leagues. This harmless bird continued to attend the ship in her course the two following days. We observed many conitos in the sea, which shot past us with great velocity; but we could not take a single one, though we endeavoured to catch them with hooks, and strike them with harpoons. We were more successful in hooking a shark, about five feet long. On this fish we dined the next day. We found it rather difficult of digestion, but, when fried, it was tolerably good eating. Nothing very remarkable happened on board our ship the Resolution, except that on the 19th, one of our carpenter's mates fell overboard, and was drowned. He was sitting on one of the scuttles, from whence it was supposed he fell. All our endeavours to save him were in vain, for he was not seen till the instant he sunk under the ship's stern. We felt his loss very sensibly, he being a sober man, as well as a good workman; and he was much regretted even by his shipmates.

On Thursday the 20th, the rain descended not in drops, but in streams, and, at the same time, the wind was squally and variable, so that the people were obliged to keep deck, and of course had all wet jackets, an inconvenience very common, and often experienced by seamen. However, this disagreeable circumstance was attended with good, as it gave us an opportunity of spreading our awnings, and filling seven empty puncheons with fresh water. This heavy rain was succeeded by a dead calm, which continued twenty-four hours, and was followed by a breeze from S. W. Between this and the south point it held for several days, at times blowing in squalls, attended with rain and hot sultry weather. On the 27th instant, one of captain Furneaux's petty officers died on board the Adventure; but on board the Resolution, we had not one man sick, although a deal of rain fell, which, in such hot climates, is a great promoter of sickness. Capt. Cook took every necessary

necessary precaution for the preservation of our health, by airing and drying the ship with fires made between decks, and by making the crew air their bedding, and wash their cloaths, at every opportunity. Two men were punished on board the Adventure; one a private marine for quarrelling with the quarter-master; the other a common sailor for theft. Each of them received one dozen. This we mention to shew what strict discipline it was necessary to preserve on board, in order to establish a regular and peaceable behaviour in such hazardous voyages, when men, unaccustomed to controul, are apt to prove mutinous.

On Tuesday, September the 8th, we crossed the line in longitude 8 deg. W. Some of the crew, who had never passed the line before, were obliged to undergo the usual ceremony of ducking, but some bought themselves off, by paying the required forfeit of brandy. Those who submitted to an immersion, found it very salutary, as it cannot well be done too often in warm weather, and a frequent change of linen and cloaths is exceeding refreshing. On the 14th, a flying fish fell on our deck; we caught several dolphins; saw some aquatic birds; and, at various intervals, observed the sea covered with numberless animals. On Sunday the 27th, a sail was discovered to the W. standing after us; she appeared to be a snow, and shewed either Portuguese colours, or St. George's ensign. We did not chuse to wait till she approached nearer, or to speak to her. The winds began now to be variable, so that we made but little way, and not any thing remarkable happened till October the 11th, when we observed an eclipse of the moon. At twenty-four minutes, twelve seconds, after six o'clock, by Mr. Kendal's watch, the moon rose about four digits eclipsed; after which the following observations were made with different instruments and time-pieces, by our astronomers and others.

On Monday the 12th, the weather being calm, we amused ourselves with shooting sea fowl. We were now accompanied by shearwaters, pintadoes, &c. and by a small grey peterel. This last is less than a pigeon, has a gray back, whitish belly, and a black stroke across from the tip of one wing to that of the other. These are southern birds, and, we believe, never seen within the tropics, or north of the line. They visited us in great flights; and about the same time we saw several animals of the molusca kind, within our reach, together with a violet-coloured shell, of a remarkable thin texture, and therefore seems calculated to keep the open sea; and not to come near rocky places, it being easily broken. Saturday the 17th, we discovered a sail to the N. W. which hoisted Dutch colours. She kept us company two days, but on the third we out-sailed her. From the 12th to this day, we had the wind between the N. and E. a gentle gale. On Wednesday the 21st, our latitude was 35 deg. 20 min. S. and our longitude 8 deg. 4 min. 30 sec. E. From this time to the 23d

the wind continued easterly, when it veered to the N. and N. W. After some hours calm, we saw a seal, or as some thought, a sea lion. The wind now fixed at N. W. which carried us to our intended port. As we drew near to land, the sea fowl, which had accompanied us hitherto, began to leave us: at least they did not appear in such numbers; nor did we see gannets, or the black bird, commonly called the Cape Hen, till we were nearly within sight of the Cape. On Thursday, the 29th, at two o'clock P. M. we made the land of the Cape of Good Hope; for a particular description of which, and of the adjacent country, see page 92, &c. of this work. The Table Mountain, over the Cape Town, bore E. S. E. distant twelve or fourteen leagues: had it not have been obscured by clouds, it might, from its height, have been seen at a much greater distance. Friday the 30th, we stood into Table Bay, with the Adventure in company, and anchored in five fathom water. We were now visited by the master-attendant of the fort, some other officers belonging to the company, and Mr. Brandt. This last gentleman brought off to us many articles that were very acceptable; and the master-attendant, as is customary, took an account of the two ships, enquiring particularly, if the small-pox was on board, a disorder dreaded above all others by the inhabitants of the cape; for which reason a surgeon always attends on these visits. This day Capt. Cook sent an officer to wait upon Baron Plettenberg the governor, to inform him of our arrival; to which he returned a polite answer; and on the return of our officer, we saluted the fort with eleven guns, which compliment was acknowledged by the same number. The governor, when the captain accompanied by some of our gentlemen, waited upon him, told them, that two French ships from the Mauritius about eight months before, had discovered land, in 48 deg. S. latitude, and in the meridian of that island, along which they sailed forty miles, till they came to a bay, into which when they were about to enter, they were driven off and separated in a hard gale, after having lost some of their people and boats, who had been sent out to found the bay; but the La Fortune, one of the ships, arrived soon after at Mauritius, the captain of which was sent home to France with an account of the discovery. We also learned from the governor, that two other French ships from Mauritius, in March last, touched at the cape in their passage to the Pacific Ocean, to which they were bound upon discoveries, under the command of M. Marion. Aotourou, the Indian, whom M. de Bougainville brought from Otaheite, was, had he been living, to have returned home with M. Marion. Having visited the governor and some of the principal inhabitants, we took up our abode at Mr. Brandt's, the usual residence of most officers belonging to English ships. With respect to accommodations, this gentleman spares neither expence nor trouble, in order to render his house as agreeable as possible to those who favour him with their company. We concerted measures with Mr. Brandt for supplying us with provisions, &c. all which he procured without delay, while our men on board were employed in overhauling the rigging, and the carpenters in caulking the ships sides, &c. At the same time Mr. Wales and Mr. Bayley made observations for regulating the watches, and other purposes. The result of these was that Mr. Kendal's watch had answered beyond our expectations, by determining the longitude of this place to within one minute of time to what it was observed in 1761, by Messrs. Mason and Dixon.

At this place two Dutch Indiamen arrived before us, from Holland. Their passage was near five months, in which one of the ships lost by the scurvy, and the other by putrid fevers, in all 191 men. One of these ships touched at Port Praya, and departed a month from thence before we came there, yet we arrived at the Cape three days before her. During our stay here, Mr. Forster, who employed his time wholly in the pursuit of Natural History and Botany, met with one Mr. Sparrman, a Swedish gentleman, who had studied under Linnæus. Mr. Forster importuned strongly Capt. Cook

to take him aboard; and Mr. Sparman being willing to embark, the Captain consented; and he was engaged under Mr. Forster, who bore his expences on board, and allowed him a yearly stipend besides. Mr. Hodges also employed himself in taking views of the Cape, town, and parts adjacent, in oil colours; all which were left with Mr. Brandt, to be forwarded by him to the admiralty, by the first ship bound for England.

On the 18th of November we had got every thing on board; but it was the 22d before we could put to sea. In this interval the crews of both ships were served every day with fresh beef, or mutton, new baked bread, and what quantity of greens they thought sufficient; and the two ships, in every respect, were put in as good condition as when they left England. At this time some removes took place in the Adventure. The first lieutenant, Mr. Shank, desired leave to resign, in order to return to England for the recovery of his health, which was granted. Mr. Kemp was appointed first lieutenant, and Mr. Burney, one of our midshipmen, was made second lieutenant, in the room of Mr. Kemp.

On the 22d we repaired on board, having first taken leave of the governor, and other officers, who in a most obliging manner had afforded us all the necessary assistance we required. At three o'clock, P. M. we weighed, and saluted the fort with fifteen guns, which compliment was instantly returned. We now stood all night to the westward, to get clear of the land, during which time the sea made the same luminous appearance, which has been already, in the course of our history, noticed and described. As soon as we had cleared the land, we directed our course, as ordered, to Cape Circumcision. We had a moderate gale from the N. W. point until the 24th, when the wind shifted to the eastward. This day by observation, at noon, we found ourselves to be in 35 deg. 25 min. S. lat. and 29 min. W. of the Cape of Good Hope. As we were now directing our course toward the antarctic circle, and expected to encounter soon with cold weather, the Captain ordered a waste of fresh water to be as much as possible prevented; at the same time he supplied each man with a searought jacket, and trowsers, allowed by the Admiralty, and also slops to such who wanted them. Observing a great number of albatrosses about us, we put out hooks and lines, with which we caught several, and the ship's company, though served with mutton, relished them very much. On the 29th a heavy storm came from the W. N. W. with few intervals of moderate weather, for nearly a week; the sea ran very high, and frequently broke over the ships.

On Sunday, December the 6th, we were in lat. 48 deg. 41 min. S. and in 18 deg. 24 min. E. longitude. The storm continued, and the roaring of the waves, together with hail, rain, and a great agitation of the vessel, were circumstances that rendered our situation extremely disagreeable. A boy in the fore part of our ship hearing a noise of water running among the chests, turned out, and found himself half way up the leg in water; upon which all hands worked at the pumps, but the water increased upon us. This was at last discovered to come in through a scuttle in the boatswain's store-room. This gale, attended with hail and rain, continued till the 8th, with such fury, that we could carry no sails; and being driven by this means far to the eastward of our intended course, not the least hope remained of our reaching Cape Circumcision. Our distress was augmented by the loss of a great part of our live stock we had brought from the Cape. Every man felt the effects of the sudden transition from warm to extreme cold weather; for which reason an addition was made to the men's allowance of brandy in both ships. On the morning of the 7th, the rising sun gave us a flattering prospect of serene weather; but our expectations soon vanished; the barometer was unusually low; and by one o'clock P. M. the wind, which was at N. W. blew with such violence as obliged us to strike our top-gallant-masts. On the 8th the gale was somewhat abated; but the sea ran too high for us to carry more than the fore-top-mast stay-sail.

No. 15.

On Wednesday, the 9th, at three A. M. we wore ship to the southward, showers of snow fell, with squally weather. At eight made signal for the Adventure to make sail. On the 10th made another signal for her to lead, and saw an ice-island to the westward of us, in 50 deg. 40 min. S. latitude, and 2 deg. E. longitude of the Cape of Good Hope. The weather being hazy, Capt. Cook by signal called the Adventure under our stern; a fortunate circumstance this; for the fog increased so much, that we could not discern an island of ice, for which we were steering, till we were less than a mile from it. The sea broke very high against this island of ice, which Captain Furneaux took for land, and therefore hauled off from it, till he was called back by signal. We cannot determine with precision on the height or circumference of this ice-island; but, in our opinion such large bodies must drift very slowly, for, as the greatest part of them are under water, they can be little affected by either the winds or waves. It being necessary to proceed with great circumspection, we reefed our top-sails, and upon sounding found no ground with one hundred and fifty fathoms.

Friday, the 11th, in 51 deg. 50 min. S. lat. and 21 deg. 3 min. E. longitude, saw some white birds, and passed another large island of ice. The birds were about the size of pigeons, with blackish bills and feet. Capt. Cook thought them of the petrel kind, and natives of these frozen seas. The dismal scene in view, to which we were unaccustomed, was varied as well by these birds, as several whales, which made their appearance among the ice, and afforded us some idea of a southern Greenland. But though the appearance of the ice, with the waves breaking over it, might afford a few moments pleasure to the eye, yet it could not fail filling us with horror, when we reflected on our danger; for the ship would be dashed to pieces in a moment, were she to get against the weather side of one of these islands, when the sea runs high.

On the thirteenth, a great variety of ice islands presented themselves to our view, and the number of our attendant birds decreased. As we were now in the latitude of Cape Circumcision, according to Mr. Bouvet's discoveries, in the year 1739, yet we were ten deg. to the longitude of it: but some people on board were very eager to be first in spying land. In this field of low ice were several islands, or hills, and some on board thought they saw land over the ice; but this was only owing to the various appearances which the ice hills make, when seen in hazy weather. We had smooth water, and brought to under a point of ice: here we consulted on places of rendezvous, in case of separation, and made several regulations for the better keeping company. We then made sail along the ice.

On Monday the fourteenth a boat was hoisted out for two gentlemen to make some observations and experiments. While they were thus engaged, the fog increased so much, that they entirely lost sight of both of the ships. Their situation was truly terrific and alarming, as they were only in a small four oared boat, in an immense ocean, surrounded with ice, utterly destitute of provisions, and far from any habitable shore. They made various efforts to be heard, and rowed about for some time, without effect; they could not see the length of their boats, nor hear any sound. They had neither mast nor sail, only two oars. They determined to lie still, as the weather was calm, and hoped that the ships would not swim out of sight. A bell sounded at a distance, which was heavenly music to their ears. They were at last taken up by the Adventure, and thus narrowly escaped those extreme dangers. So great was the thickness of the fog sometimes, that we had the utmost difficulty to avoid running against the islands of ice, with which we were surrounded. We stood to the south on the seventeenth, when the weather was clear and serene, and saw several sorts of birds, which we were unacquainted with. The skirts of the ice seemed to be more broken than usual, and we sailed among it most part of the day; we were obliged to stand to the northward, in order to avoid it. On the eighteenth we got clear of the field of ice, but was carried among

the ice islands, which it was difficult to keep clear of. The danger to which we were now exposed, was preferable to being entangled among immense fields of ice. There were two men on board the *Resolution*; who had been in the Greenland trade; the one had lain nine weeks, and the other six, stuck fast in a field of ice. That which is called a field of ice is very thick, and consists but of one piece, be it ever so large. There are other pieces of great extent packed together, and in some places heaped upon each other. How long such ice may have lain here, is not easily determined. In the Greenland seas, such ice is found all the summer long, and it cannot be colder there in summer time than it is here. Upon the supposition that this ice which we have been speaking of is generally formed in bays and rivers, we imagined that land was not far from us, and that the ice alone hindered our approaching it. We therefore determined to sail to the eastward, and afterwards to the south, and, if we met with no land or impediment, there to get behind the ice, that this matter might be put out of doubt. We found the weather much colder, and all the crew complained of it. Those jackets which were too short were lengthened with baize, and each of them had a cap made of the same stuff, which kept them as warm as the climate would admit. Scorbutic symptoms appearing on some of the people, the surgeons gave them fresh wort every day, made from the malt we took with us for that purpose.

We stood once more to the southward on the twenty-second instant. On the twenty-third, we hoisted out a boat to make such experiments as were thought necessary. We examined several species of birds, which we had shot as they hovered round us with seeming curiosity.

On the twenty-fifth, being Christmas-day, we were very cheerful, and notwithstanding the surrounding rocks of ice, the sailors spent it in savage noise and drunkenness. On the twenty-sixth, we sailed through large quantities of broken ice. We were still surrounded with islands, which in the evening appeared very beautiful, the edges being tinged by the setting sun. We were now in latitude 58 deg. 31 min. S.

On the twenty-seventh we had a dead calm, and we devoted the opportunity to shooting petrels and penguins. This afforded great sport, though we were unsuccessful in our chase of penguins. We were obliged to give over the pursuit, as the birds dived so frequently, and continued so long under water. We at last wounded one repeatedly, but was forced finally to kill it with a ball; its hard glossing plumage having constantly turned the shot aside. The plumage of this bird is very thick, the feathers long and narrow, and lie as close as scales. These amphibious birds are thus secured against the wet, in which they almost continually live. Nature has likewise given them a thick skin, in order to resist the perpetual winter of these inhospitable climates. The penguin we shot weighed eleven pounds and a half. The petrels are likewise well provided against the severity of the weather. These latter have an astonishing quantity of feathers, two feathers instead of one proceeding out of every root. Glad were we to be thus employed, or indeed to make any momentary reflections on any subject, that we might in some measure change that gloomy uniformity in which we so slowly passed our time in these desolate and unfrequented seas. We had constant disagreeable weather, consisting of thick fogs, rain, sleet, hail, and snow; we were surrounded with innumerable quantities of ice, and were in constant danger of being split by them; add to which, we were forced to live upon salt provisions, which concurred with the weather to infect our maws of blood. Our seamen coming fresh from England did not yet mind these severities and fatigue, their spirits kept them above repining at them; but among some of us a wish prevailed to exchange our situation for a happier and more temperate one. The crew were well supplied with portable broth and sour krout, which had the desired effect in keeping them from the scurvy. The habit of body in one man was

not to be relieved by those expedients, but he was cured by the constant use of fresh wort. This useful remedy ought never to be forgotten in ships bound on long voyages, or the encomiums on the efficacy of malt cannot be exaggerated; great care must also be taken to prevent its becoming damp and mouldy, for if it is suffered to do so, its salutary qualities will become impaired in a long voyage.

On the 29th, the commanders came to a resolution, provided they met with no impediment, to run as far west as Cape Circumcision, since the sea seemed to be pretty clear of ice, and the distance not more than eighty leagues. We steered for an island of ice this day, intending to take some on board, and convert it into fresh water. On this island we saw a great number of penguins. The sight of these birds is said to be a sure indication of the vicinity of land. This may hold good where there are no ice islands, but not so when there are any, for there they find a resting place. We will not determine whether there are any females among them at so great a distance from land, or whether they go on shore to breed.

On the 31st, we stood for this island again, but could not take up any of the loose ice, for the wind increased so considerably, as to make it dangerous for the ships to remain among the ice; besides which, we discovered an immense field of ice to the north, extending further than the eye could reach. We had no time to deliberate, as we were not above two or three miles from it.

On the 1st of January, the gale abated, A. D. 1773. but there fell a good deal of snow and sleet, which froze on the rigging of the ships. The wind continued moderate the next day, and we were favoured with a sight of the moon, whose face we had not seen since we left the Cape of Good Hope. We were now in 59 deg. 12 min. S. latitude, and in 9 deg. 45 min. E. longitude. Several observations were made of the sun and moon. We were nearly in the longitude assigned by M. Bouvet to Cape Circumcision; but as the weather was very clear at this time, inasmuch that we could see at least fifteen leagues distance from us, it is most probable that what he took for land was no more than mountains of ice, surrounded by loose or packed ice, the appearances of which are so deceptive. From all the observations we could make, we think it highly probable that there is no land under the meridian between the latitude of 55 and 59 deg. We directed our course to the E. S. E. that we might get more to the S. We had a fresh gale and a thick fog, a good deal of snow and sleet, which froze on the rigging, and every rope was covered with fine transparent ice. This was pleasing enough to look at, but made us imagine it was colder than it really was, for the weather was much milder than it had been for many days past, and there was not so much ice in the sea. One inconvenience attended us, which was, that the men found it very difficult to handle the rigging.

On Friday the 8th, we passed more ice islands, which became very familiar to us. In the evening we came to one which had a vast quantity of loose ice about it, and, as the weather was moderate, we brought to, and sent the boats out to take up as much as they could. Large piles of it were packed upon the quarter-deck, and put into casks, from which, after it was melted, we got water enough for thirty days. A very little salt water adhered to the ice, and the water which this produced was very fresh and good. Excepting the melting and taking away the ice, this is a most expeditious method of supplying ships with water. We observed here several white whales, of an immense size. In two days afterwards we took in more ice, as did the *Adventure*. Some persons on board, who were ignorant of natural philosophy, were very much afraid that the unmelted ice, which was kept in casks, when the weather altered, would dissolve and burst the casks in which it was packed, thinking that, in its melted state it would take up more room than in its frozen one. In order to undeceive them, Capt. Cook placed a little pot of stamped ice in a temperate cabin, which, as it gradually

dually dissolved, took up much less space than before. This was a convincing argument, and their fears of this sort subsided. As we had now several fine days, we had frequent opportunities of making observations, and trying experiments, which were very serviceable to us on many accounts. The people likewise took the opportunity of washing their cloaths in fresh water, which is very necessary in long voyages.

On the 17th, before noon, we crossed the antarctic circle; and advanced into the southern frigid zone, which to all former navigators had remained impenetrable. We could see several leagues around us, as the weather was tolerably clear. In the afternoon we saw the whole sea covered with ice, from S. E. to S. W. We saw a new species of the petrel, of a brown colour, with a white belly and rump, and a large white spot on the wings; we saw great flights of them, but never any of them fell into the ships. We called it the Antarctic petrel, as such numbers of them were seen herabouts.

In the afternoon we saw thirty-eight ice islands, large and small. This immense field was composed of different kinds of ice; such as field-ice, as so called by the Greenlanders, and packed ice. Here we saw several whales playing about the ice, and still large flocks of petrels. Our latitude was now 67 deg. 15 min. S.

We did not think it prudent to persevere in a southern direction, as that kind of summer which this part of the world produces was now half spent; and it would have taken up much time to have gone round the ice, supposing it practicable; we therefore resolved to go directly in search of the land lately discovered by the French.

On the 19th, in the evening, we saw a bird, which in Capt. Cook's former voyage was called the Port Egmont hen; so called, because there are great numbers of them to be seen at Port Egmont in Falkland islands. They are about the size of a large crow, short and thick, of a chocolate colour, with a white speck under each wing. Those birds are said never to go far from land; and we were induced from this circumstance to hope that land was near, but we were disappointed; the ice islands had probably brought this bird hither.

On the 21st, we saw white albatrosses with black tipped wings. On the 29th, several porpoises passed us with amazing swiftness; they had a large white spot on their sides, which came almost up to their backs. They went at least three times as fast as our vessels, and we went at the rate of seven knots and a half an hour. On the 31st, we passed a large ice island, which at the time of our sailing by was tumbling to pieces. The explosion equalled that of a cannon.

On the 1st of February, we saw large quantities of sea weed floating by the ships. Capt. Furneaux acquainted Capt. Cook, that he had seen a number of divers, which very much resembled those in the English seas, and likewise a large bed of floating rock-weed. These were certain signs of the vicinity of land; but we could not tell whether it was to the E. or W. We

imagined that no land of any extent lay to the W. because the sea ran so high from the N. E. N. N. W. and W. we therefore steered to the E. lay to in the night, and resumed our course in the morning. We saw two or three egg birds, and passed several pieces of rock-weed, but no other signs of land. We steered northward, and made signal for the Adventure to follow, as she was rather thrown astern by her movement to the eastward. We could not find land in that direction, and we again steered southward. There was an exceeding thick fog on the 4th, on which we lost sight of the Adventure. We fired several signals, but were not answered; on which account we had too much reason to think that a separation had taken place, though we could not well tell what had been the cause of it. Capt. Cook had directed Capt. Furneaux, in case of a separation, to cruise three days in that place he last saw the Resolution. Capt. Cook accordingly made short boards, and fired half hour guns till the afternoon of the 7th, when the weather cleared up, and the Adventure was not to be seen in the limits of that horizon. We were obliged to lie to till the 10th, and notwithstanding we kept firing guns, and burning false fires all night, we neither saw nor heard any thing of the Adventure, and were obliged to make sail without her, which was but a dismal prospect, for we were now exposed to the danger of the frozen climate without the company of our fellow-voyagers, which before had relieved our spirits, when we considered that we were not entirely alone in case we lost our own vessel. The crew universally regretted the loss of the Adventure; and they seldom looked around the ocean without expressing some concern that we were alone on this unexplored expanse. At this time we had an opportunity of seeing what we had never observed before, the aurora australis, which made a very grand and luminous appearance. Nothing material happened to us, but various changes of the weather and climate, till the 25th of March, when land was seen from the mast-head, which greatly exhilarated the spirits of our sailors. We steered in for the land with all the sail we could carry, and had the advantage of good weather and a fresh gale. The captain mistook the bay before us for Dusky Bay, the islands that lay at the mouth of it having deceived him. We proceeded for Dusky Bay, in New Zealand, but with much caution as we advanced nearer the land. We passed several islands, &c. and two leagues up the bay an officer was sent out to look for anchorage, which he found, and signified it by signal. Here we anchored in fifty fathoms water, and very near the shore. This joyful circumstance happened on the 26th of March, after we had been 117 days at sea, and sailed 3660 leagues, without so much as once seeing land. It might be supposed, from the length of time we had been at sea, that the people would have been generally affected by the scurvy; but the contrary happened, owing to the precautions we used. We had much reason to be thankful to the Divine Providence, that no untoward accident had befallen us, and that our crew were in good health.

C H A P. II.

A narrative of what happened in Dusky Bay, in New Zealand—Interviews with the natives—The Resolution sails to Charlotte's Sound—Is there joined by the Adventure—Transactions in this place, with observations on the inhabitants—Capt. Furneaux's narrative—The two ships proceed in company from New Zealand to the island of Otaheite—Remarks on some low islands, supposed to be the same that were discovered by M. de Bougainville—The Resolution and Adventure arrive at Otaheite—Are in a critical situation—An account of several incidents while they lay in Oaiti piba Bay.

THE country appeared beautiful and pleasing. The islands we passed, before our entrance into Dusky Bay, were shaded with evergreen, and covered with woods; the various shades of autumnal yellow, intermixed with the evergreens, exhibited a delightful contrast. The rocky shores were enlivened with flocks

of aquatic birds, and the whole country resounded with the wild notes of the feathered songsters. As soon as we anchored we caught great numbers of fish, which eagerly took the bait laid for them. Our first meal upon fish here was looked upon as the most delightful we had ever made. Capt. Cook did not like the place

in which we anchored, and sent lieutenant Pickersgill in search of a better, which he soon found. The captain liked it, and called it Pickersgill harbour. This we entered on the twenty-seventh of March, by a channel which was scarcely twice the width of the ship. Here we determined to stay some time, and examine it thoroughly, as no one had ever entered it before, or landed on any of the southern parts of this country. Our situation was admirable for wood and water. Our yards were locked in the branches of trees, and near our stern ran a delightful stream of fresh water. We made preparations on shore for making all necessary observations, and perform necessary repairs, &c. &c. The live cattle we had left, which consisted of a few sheep and goats, would not taste the grass which grew on the shore: nor were they very fond of the leaves of tender plants which grew here. When we examined these poor creatures, we found their teeth loose, and they had other symptoms of an inveterate scurvy. We had not hitherto seen any appearance of inhabitants; but on the twenty-eighth some of the officers went on a shooting party in a small boat, and discovering them, returned to acquaint Capt. Cook therewith. Very shortly a canoe came filled with them, within musket shot of the ship. They stood looking at us for some time, and then returned; we could not prevail upon them to come any nearer, notwithstanding we shewed them every token of peace and friendship. Capt. Cook, with several officers and gentlemen, went in search of them the same day. We found the canoe hauled upon the shore, where were several huts, with fire-places and fishing-nets, but the people had probably retired into the woods. We made but a short stay, and left in the canoe some medals, looking-glasses, &c. not chusing to search any further, or enforce an interview which they wished to avoid; we returned accordingly to the ship. Two parties went out the next day, but returned without finding any thing worth noticing.

On the first of April we went to see if any thing we had left in the canoe remained there. It did not appear that any body had been there, and none of the things meddled with. On the 2nd we again went on shore to search for natural productions. We killed three seals, and found many ducks, wood hens, and wild fowl, several of which we killed. Another party went ashore the same day, and took with them a black dog we had brought from the Cape, who ran into the woods at the first musquet they fired, and would not return. Both parties came back to the ship in the evening.

On the sixth, we made a shooting party, and found a capacious cove, where we shot several ducks; on which account we called it Duck Cove. We had an interview with one man and two women, as we returned in the evening, who were natives, and the first that discovered themselves; and had not the man halloed to us, we should have passed without seeing them. The man stood upon the point of a rock, with a club in his hand, and the women were behind him with spears. As we approached, the man discovered great signs of fear, but stood firm; nor would he move to take up some things that were thrown to him. His fears were all dissipated by Capt. Cook's going up to embrace him; the captain gave him such things as he had about him. The officers and seamen followed the Captain, and talked some time with them; though we could not understand them. In this conversation, the youngest of the women bore the greatest share. A droll fellow of a sailor remarked, that the women did not want tongue in any part of the world. We were obliged to leave them on the approach of night; but before we parted Mrs. Talkative gave us a dance.

On the seventh we made them another visit, and presented them with several things; but they beheld every thing with indifference, except hatchets and spike nails. We now saw all the man's family, as we supposed, which consisted of two wives, the young woman we mentioned before, a boy about fourteen years old, and three small children. Excepting one woman (who

had a large wen upon her upper lip), they were well favoured; on account of her disagreeable appearance, she seemed to be neglected by the man. We were conducted to their habitation, which consisted of two mean huts, situated near the skirts of a wood. Their canoe lay in a small creek, near the huts, and was just large enough to transport the whole family from place to place. A gentleman of our party made sketches of them, which occasioned their calling him Toe-Toe; which, it seems, is a word which signifies marking or painting. On taking leave, the man presented Capt. Cook with some trifles, and a piece of cloth of their own manufacture; and pointed to a boat cloak, which he wished to have. The hint was taken, and one was ordered to be made for him of red baize. On the 9th we paid the natives another visit, and signified our approach by hallooming to them; but they neither met us on shore, nor answered us as usual; the reason of which was, that their time was fully occupied in dressing themselves to receive us. They had their hair combed and oiled, stuck with white feathers, and tied upon the crowns of their heads, and had bunches of feathers stuck in their ears. We were received by them with great courtesy in their dress. The man was so well pleased with the present of the cloak, that he took his patta-patoc from his side, and gave it to Capt. Cook. We continued here a little time, and took leave, spending the rest of the day in surveying the bay.

On Monday the twelfth this family paid us a visit in their canoe, but proceeded with caution as they approached the ship. We could not by any means persuade them to come on board, but put ashore in a little creek near us, and sat themselves down near enough to speak to us. Capt. Cook ordered the bagpipes to play, and the drum to beat; the latter only they regarded. They conversed very familiarly (though not well understood) with such officers and seamen as went to them, and paid a much greater regard to some than to others; we supposed that they took such for women. One of the females shewed a remarkable fondness for one man in particular, until she found out his sex; after which she would not let him approach her. We cannot tell whether she had before taken him for a female, or whether, in discovering himself, he had taken some liberties with her. In the evening the natives of Dusky Bay took up their quarters very near our watering-place, which was a clear proof that they placed a great deal of confidence in us. We passed two or three days in examining the bay and making necessary experiments and observations. We likewise shot great quantities of wild fowl.

On Monday the nineteenth, the man and his daughter before-mentioned ventured on board our ship, while the rest of the family were fishing in the canoe. Before the man would come into the ship, he struck the side of it with a green branch, and muttered some words, which we took for a prayer; after which he threw away the branch and came on board. We were at breakfast, but could not prevail on them to partake with us. They viewed every part of the cabin with apparent curiosity and surprise; but we could not fix the man's attention to any one thing for a moment. All we shewed him seemed beyond his comprehension, and the works of nature and art were alike regarded. The strength and number of our decks and other parts of the ship seemed to strike him with surprise. The man was still better pleased with hatchets and spike-nails than any thing our ship produced; when he had once got possession of these, he would not quit them. Capt. Cook and three other gentlemen left the ship as soon as they could disengage themselves from the visitors, whom they left in the gun-room, and went out in two boats to examine the head of the bay; at which place they took up their night's lodging; the next day they continued their observations; and fired at some ducks. Upon the report of the gun, the natives, who had not discovered themselves before, set up a most hideous roar in different places. The gentlemen halloed in their turn, and retreated to their boats. The natives did not follow them, neither indeed could they, because a branch

of the river separated them, but still made a great noise. As they continued shooting and making their observations, they frequently heard the natives in the woods. A man and woman appeared at last on the banks of the river, waving something in their hands as a token of friendship. The gentlemen could not get near them, and the natives retreated into the woods. Two others appeared; but as the gentlemen advanced, they retreated likewise, and the woods afforded them thick cover. The captain and his party passed the next night in the same place, and after breakfast embarked to return on board; but saw two men on the opposite shore, who hallooed to them, and they were induced to row over to them. Capt. Cook with two other gentlemen landed unarmed, and advanced all together, but the natives retreated, nor would they stand still till Capt. Cook went up alone. It was with some difficulty that he prevailed on one of them to lay down his spear; at last he did it, and met the captain with a grofs plant in his hand, giving Capt. Cook one end to hold whilst he himself held the other. In this position they stood while the native made a speech, which the captain did not understand, but returned some sort of answer; they then saluted each other, and the native took his coat from his back, and put it on the captain. The Captain presented each of them with a hatchet and a knife, having nothing else with him. They invited the gentlemen to their habitation, and wanted them to eat, but the tide prevented their accepting of this invitation. More people appeared in the skirts of the woods, but did not approach any nearer. The two natives accompanied the gentlemen to their boats, but seemed very much agitated at the appearances of the musquets, which they looked upon as instruments of death, on account of the slaughter they had observed among the fowls. It was necessary to watch them, for they laid their hands on every thing except the musquets. They assisted the seamen in launching the boat. It did not appear that they had any boats or canoes with them, but used two or three logs of wood tied together, which answered the same purposes; for the navigation of the river, on the banks of which they lived, was not very difficult, and swarmed with fish and fowl. We apprehend that all the natives of this bay did not exceed more than three families. This party took leave of the man about noon; and in the evening returned to the ship, when they found that the visitors had staid on board till noon; that he and his family remained near them till that day, and went into the woods, after which they were never seen; this appears rather extraordinary, as they never went away without some present. Several parties were made in order to catch seals, which were very useful for food, for oil, and their skins were cured for rigging. The flesh of them is nearly as good as beef-steaks, and their entrails are equal to those of a hog. We likewise took the summit of the mountains in this bay, and made other remarks.

On Saturday the twenty-fourth Capt. Cook took five geese and a gander, which were all that remained of those brought from the Cape of Good Hope, and carried them to a cove, which on this account he called goose-cove; this was a convenient place, for they were not likely to be disturbed by the inhabitants, there was plenty of food for them, and they were likely here to breed and spread the country with their species. We had now several days fair weather, which gave us a fine opportunity of making necessary preparations for departure.

On Tuesday the twenty-seventh we found an arm of the sea more convenient than that by which we entered the bay; we shot several ducks, and were much pleased with the day's expedition. All we now waited for was wind to carry us out of harbour by the new passage we had discovered. The tents and all other articles were got on board. The rubbish we had made on shore, which consisted chiefly of pieces of wood, &c. we set on fire, in order to dry the ground, which being done, Capt. Cook sowed the spot with various sorts of garden seeds. This was the best place we could find to place

No. 15.

them in. We made several efforts to fail, but the wind proving contrary we made but little way, and were obliged to anchor on the first of May on the north side of Long Island. Here we found two huts with fire places, which appeared to be lately inhabited. Capt. Cook was detained on board by a cold, and sent a party to explore an arm of the sea which turns in to the east. This party found a good anchoring place, with plenty of wild fowl, fish, and fresh water. We made several shooting parties when the wind would not permit us to fail. Before we leave Dusky Bay, we think it necessary to give our readers some description of it.

There are two entrances to this Bay, which are by no means dangerous; and there are numerous anchoring places, which are at once safe and commodious; at Cascade Cove, so called on account of the magnificent cascade near it, is room for a fleet of ships, and a very good passage in and out. The country is very mountainous, and the prospect is rude and craggy. The land bordering on the sea-coast, and all its lands, are covered with wood. There are trees of various kinds which are common in other countries, the timber of which is remarkably fine. Here are likewise a great number of aromatic plants, and the woods are so over-run with supple jacks, that it is difficult to make way through them. The soil is undoubtedly composed of decayed vegetables, which make a deep black mould; it is very loose, and sinks at every step. This may be the reason why there are so many large trees blown down as we meet with in the woods. Except flax and hemp, there is very little herbage. The bay abounds with fish, which we caught in great numbers. Seals are the only amphibious animals to be found here, but there are great numbers of them. Various kinds of ducks are to be found, as well as all other wild fowl. Here is likewise a bird which we called the wattle-bird, because it has two wattles under its beak like those of a dunghill cock. Its bill is short and thick, its feathers are dark, and is about the size of an English black-bird. This we called the poy-bird, on account of two little tufts of curled hair which hang under its throat, called its poies, which is the Otaheitan word for earrings. The feathers of this bird are of a fine mazarine blue, except those of his neck, which are of a silver grey. The sweetness of its note is equal to the beauty of its plumage; its flesh is likewise luxurious food, though it is a great pity to kill them.

The small black sand flies are here very numerous and troublesome; they cause a swelling and intolerable itching wherever they bite. Another evil attending this bay is the almost continual rains that fall, but happily our people felt no ill effects from them. The place must certainly be healthful, as those of our crew, who were in any degree indisposed when we came in, recovered speedily.

The inhabitants of Dusky Bay are the same with those in other parts of New Zealand; they speak the same language, and adopt the same customs. It is not easy to divine what could induce these few families to separate themselves from the society of the rest of their fellow-creatures. It seems probable that there are people scattered all over this southern island, by our meeting with inhabitants in this place. They appear to lead a wandering life, and don't seem to be in perfect amity with each other.

On Tuesday the 11th of May, we again made sail, but met with more obstructions. We observed on a sudden a whitish spot on the sea, out of which a column arose which looked like a glass tube. It appeared that another of the same sort came down from the clouds to meet this, and they made a coalition and formed what is called a water-spout; several others were formed in the same manner soon after. As we were not very well acquainted with the nature and causes of these spouts, we were very curious in examining them. Their base was a broad spot, which looked bright and yellowish when the sun shone upon it; this appeared when the sea was violently agitated, and vapours rose in a spiral form. The columns were like a cylinder, and moved forward on the surface of the sea, and frequently

2 K

appeared

appeared crossing each other, they at last broke one after another, this was owing to the clouds not following them with equal rapidity. The sea appeared more and more covered with short broken waves as the clouds came nearer to us; the wind veered about, and did not fix in any one point. Within 200 fathoms of us, we saw a spot in the sea in violent agitation; the water ascended in a spiral form towards the clouds; the clouds looked black and lowering, and some hail stones fell on board. A cloud gradually tapered into a long slender tube directly over the agitated spot, and seemed descending to meet the rising spiral, and soon united with it. The last water-spout broke like others, no explosion was heard, but a flash of lightning attended this disjunction. The oldest mariners on board had never been so near water-spouts before, they were therefore very much alarmed. Had we been drawn into the vortex, it was generally believed that our masts and yards must have gone to wreck. From the first appearance, to the last dissolution, was three quarters of an hour.

On May the 18th, at five o'clock in the morning, we opened Queen Charlotte's Sound, and saw three flashes arising from a strong hold of the natives. We imagined them to be signals of the Europeans, and probably of our old friends in the Adventure; when we fired some guns, we were answered, and in a short time saw the Adventure at anchor. We were saluted by Capt. Furneaux with 13 guns, which we very cheerfully returned; none can describe the joy we felt at this most happy meeting.

As it must be pleasing to our Subscribers and Readers, whose generous encouragement we gratefully acknowledge, and it being our intention, in return, to render this work as complete, in every respect, as possible, we here present them with a Narrative of Capt. Furneaux's proceedings, and of the various incidents that happened, during the separation of the two ships, to their joining again in Queen Charlotte's Sound; with some account of Van Diemen's Land.

A. D. 1773. **T**HE Adventure, on Sunday the 4th of February, after having lost sight of the Resolution, in a very thick fog, had no other means of again meeting with her, but by cruising in the place where they parted company, or by repairing to Charlotte Bay, the first appointed place of rendezvous, in case such a misfortune should happen. Soon after their separation, the people of the Adventure heard a gun, the report of which they judged to be on the larboard beam; upon which, they hauled up S. E. and fired a four pounder every half hour; but receiving no return, nor sight of their companion, they kept the course they had steered before the fog came on. In the evening it began to blow hard. The storm was attended with a prodigious fall of rain, every drop of the size of a common pea; and the sea broke over the ship's bows to the height of the yard arms; yet, at intervals, the weather was more clear; but at these favourable opportunities, they could not see their wished for object, the Resolution, which gave them many moments replete with inexpressible uneasiness. They then stood to the westward, to cruise in the latitude where they last saw her, according to agreement, in case of separation; but the storm returned with renewed fury, and the weather being again exceeding hazy, they were compelled to bring to, which untoward circumstance prevented them from reaching the intended place; however, they cruised as near the same as they could for three days, when, after having kept beating about the seas, in the most terrible weather that any ship could possibly endure, and giving all hopes over of joining their lost companion, they bore away for winter-quarters, 1400 leagues distant from them; and, having to traverse a sea entirely unknown, they took every precaution for their safety, and reduced the allowance of water to one quart a day for each seaman. On the 8th, they kept between the latitude 52 and 53 degrees S. and

reached to 95 deg. E. longitude. They had here hard gales from the W. attended with snow, sleet, and a long hollow sea from the S. W. On the 26th a meteor, called to the northward, the Aurora Borealis, or northern lights, appeared with uncommon brightness in the N. N. W. directing its course to the S. W. And what is more remarkable, after our separation from the Resolution to our making land, we saw but one of the Ice-islands, though in the most part of our long run, we were 2 or 3 degrees southward of the latitude in which we first met with them; but we saw numberless sea birds, and porpoises, curiously spotted with white and black, frequently darted swiftly by our ship.

On Monday the 1st of March, having made no discovery of land, though we had traversed from latitude 48 to 45 degrees S. and from longitude 36 to 146 degrees, it was determined to bear away for Van Diemen's Land, in order to take in water, and repair our shattered rigging. This land, supposed to join New Holland, was discovered by Tasman A. D. 1642, and in the charts is laid down in latitude 44 deg. S. and longitude 140 deg. E. On the 9th being Tuesday, about nine o'clock A. M. we fell in with the S. W. part of this coast bearing N. N. E. 8 or 9 leagues distant, and 140 deg. 10 min. E. longitude from Greenwich. It appeared moderately high and uneven near the sea, but the hills farther back formed a double land and much higher. We saw a point which bore N. four leagues off from us, much like the ram-head off Plymouth. This we concluded to be the same that Tasman called the South Cape. About four leagues E. S. E. half E. from hence are three islands, and several rocks, resembling the Mewstone, (one of which we so named) and they are not laid down by Tasman in his draughts. At the South East Cape, in latitude 43 deg. 36 min. S. and 147 deg. E. longitude, the country is hilly and full of trees, the shore rocky, and landing difficult, caused by the wind blowing continually from the westward, which occasions such a surf, that the sand cannot lie on the shore. On Wednesday the 10th A. M. the second lieutenant was dispatched in the great cutter, the ship being about four miles from the land, to find if there was any harbour or good bay. With much difficulty they landed, saw several places where the Indians had been, and one they had lately left. There was a path in the woods, which probably leads to their habitations but our people had not time to pursue it. The soil appears to be very rich, and the country well clothed with wood, especially on the side of the hills. Plenty of water fell from the rocks, in beautiful cascades, for two or three hundred feet perpendicular into the sea. Not perceiving the least sign of any place to anchor in, we hoisted in the boat and made sail for Frederick Henry Bay. At three o'clock P. M. we were abreast of the westernmost point of a very deep bay called by Tasman, Stormy Bay. Several islands from the W. to the E. point of this bay, and some black rocks, we named the Friars. At seven, being abreast of a fine bay, with little wind, we came to, and by a good observation found our latitude to be 43 deg. 20 min. S. and our longitude 147 deg. 34 min. E. On Thursday the 11th, at day-break, we found a most commodious harbour, and at seven in the evening, we anchored in 7 fathom water, about one mile from the shore on each side. Maria's island is about 5 or 6 leagues off. Here we lay five days, and found the country exceeding pleasant. The soil, though thin, is rich; and the sides of the hills are covered with large trees, that grow to a great height before they branch off. They differ from any we had hitherto seen. All of them are of the evergreen kind, and the wood being very brittle, is easily split. Of these we found only two sorts. The leaves of one are long and narrow, and the seed, shaped like a button, has a very agreeable smell. The leaves of the other resemble those of the bay, and its seed that of the white thorn. From these trees, when cut down, issued, what the surgeons call, gum-lac. They are scorched near the ground, by the natives setting fire to the underwood in the most unfrequented places. Of the land birds, are some like a raven, others

of the crow kind, paroquets, and several sorts of small birds. One of our gentlemen shot a large white fowl of the eagle kind, about the size of a kite. The sea fowl are ducks, teal, and the sheldrake. Of beasts we saw only an opossum, but observed the dung of others which we pronounced to be of the deer kind. The fish we caught in the bay were mostly sharks, dog fish, and another sort called by the seamen nurfes, full of white spots, and some small ones not unlike sprats. In the Lagoons are trout, and other sorts of fish, a few of which we caught with hooks. During our stay here, we did not see any of the natives, but perceived the smoke of their fires, eight or ten miles to the northward. It is evident that they come into this bay from their wigwams or huts, which are formed of boughs, either broken, or split, and tied together with grass: the largest ends are stuck in the ground, and the smaller are brought to a point at the top; making the whole of a circular form, which is covered with fern or bark, in the middle of which is the fire-place, surrounded with heaps of muscle, pear scallop, and cray-fish shells. In one of their huts we found the stone they strike fire with, and some tinder made of the bark of a tree. In others of their wigwams were one of their spears, sharp at one end, with some bags and nets made of grass, which contained, we imagine, their provisions and other necessaries. We brought most of those things away, leaving in their room medals, gun-flints, a few nails, and an old iron-hooped empty barrel. The huts of these people seemed to be built only for a day, the workmanship being so slender, that they will hardly keep out a shower of rain. The inhabitants lie on the ground, on dried grass, round their fires. They wander about, in small parties, from one place to another in search of food, the chief end of their existence; and, from what we could judge, they are altogether an ignorant, wretched race of mortals, though natives of a country capable of producing every necessary of life, and a climate the finest in the world. Having got on board our wood and water, we sailed out of Adventure Bay, intending to coast it, with a view of discovering whether Van Diemen's Land is part of New Holland.

On Tuesday the 16th, we passed Maria's Islands, and on the 17th Schouten's, when we hauled in for the main land, and stood off two or three leagues along shore. Here the country appeared well inhabited, and the land level; but we discovered not any signs of a harbour or bay, wherein a ship might anchor with safety. The land in lat. 40 deg. 50 min. S. trends to the westward, and from this latitude to that of 39 deg. 50 min. is nothing but islands and shoals; the land appearing high, rocky, and barren. We now stood to the northward, and again made land in 39 deg. but soon after discontinued this course, to fall in with the shore being very dangerous. From Adventure Bay to where we stood away for New Zealand, the coast lies in the direction S. half W. and N. half E. and Capt. Furneaux was of opinion, that there are no straits between New Holland and Van Diemen's Land, but a very deep bay. The wind blowing a strong gale at S. S. E. and seeming likely to shift round to the eastward, he thought it most prudent to leave the coast, and make the best of his way for New Zealand.

On the 24th, having left Van Diemen's land, a very severe squall reduced us to reefed courses. We shipped many waves, one of which stove the large cutter, and with much difficulty we prevented the small one from being washed over-board. After this heavy gale, which continued twelve hours, we had more temperate weather, accompanied with calms. At length we made the coast of New Zealand in 40 deg. 30 min. S. latitude, having run twenty-four deg. of longitude from Adventure Bay, in a passage of fifteen days. When we first came in sight of land, it appeared high, forming a confused group of hills and mountains. We steered along shore to the northward, but our course was much retarded by the swell from the N. E.

On Saturday, April the 3d, at six o'clock, A. M. we descried land, which upon a nearer approach we

knew to be that which lies between Rock Point and Cape Farewell, so named by Capt. Cook, when on his return from his last voyage. Cape Farewell, the south point of the entrance of the west side of the straits, bore E. by N. half N. three or four leagues distant. Sunday, the 4th, we continued our course, and stood to the eastward for Charlotte's Sound. On Monday, the 5th, we worked up to windward under Point Jackson. From Stephen's Island to this point, the course is nearly S. E. distance eleven leagues. We fired several guns while standing off and on, but saw not any inhabitants. At half past two P. M. we anchored in thirty-nine fathoms water, muddy ground; Point Jackson being S. E. half E. three leagues. At eight we weighed and made sail. Tuesday, the 6th, at eight o'clock A. M. had the Sound open, and worked up under the western shore. At ten came to, close to some white rocks, in thirty-eight fathoms, and on the 7th anchored in Ship Cove, in ten fathoms water, and moored the best bower to the N. N. E. In the night heard the howling of dogs, and people hallooing on the east shore. Capt. Furneaux now ordered the large cutter to be manned, and sent her, with a proper guard, to examine, whether there were any signs of the Resolution having arrived at that harbour. The boat returned, without the least discovery, but that of the post, erected by the Endeavour's people, on the top of a hill, with her name and time of her departure in 1770. Upon this, we instantly prepared to send the tents ashore, for the accommodation of those who were afflicted with the scurvy; while such who enjoyed health were very alert in catching fish, which proved of great service in recovering our sick, to whom fresh provisions were both food and physic.

On Friday, the 9th, three canoes came along-side the Adventure, having fifteen Indians of both sexes, all armed with battle axes, and with other offensive weapons made of hard wood, in the form of our officers' spontoons, about four feet in length; but they had neither bows nor arrows. A kind of mat was wrapt round their shoulders, and tied about their waists with a girdle made of grass. Both men and women exhibited a most savage appearance, and were very unwilling to venture on board. The Captain made them presents, and by signs invited them to trade. They accepted the presents, and some of them assumed courage enough to trust themselves on deck. One of our gentlemen, seeing something wrapt up, had the curiosity to examine what it was, when, to his great surprize, he found it to be the head of a man, which, by its bleeding, seemed to be fresh cut off. As Capt. Cook had expressed his abhorrence of such unnatural acts, the Indians were very apprehensive of its being forced from them, and the man, to whom it belonged, trembled for fear of being punished. They therefore, with surprizing dexterity, in order to conceal the head, shifted it from one to another, till it was conveyed out of sight; endeavouring, at the same time, to convince us by signs, that no such thing was in their possession. They then left the ship, and went on shore, not without some visible signs of displeasure. In this visit they often mentioned the name of Tupia, and upon being informed he died at Batavia, some of them with much concern enquired whether we killed him, or if he died a natural death. By these questions, we concluded these Indians were some of the same tribe who had visited the Endeavour's company. They returned in the afternoon, with fish and fern roots, which they bartered for nails, to them the most valuable articles; but the man and woman who had the head were not among them. Having a catalogue of words in their language, we called several things by name, at which they seemed much surprized, and offered a quantity of fish for the catalogue. On Saturday the 10th about eight in the morning, five double canoes came along-side the Adventure, with about fifty Indians, at the head of whom was their chief. We purchased of them, for nails, and bottles, their implements of war, stone hatchets, cloth, &c. upon which they set a high price. Several of their head men came

on

on board, nor would they quit the ship by fair means; but upon presenting a musquet with a bayonet fixed, they quickly took leave of us, seemingly in great good humour; and afterwards they visited us daily, bringing with them fish in abundance, which they exchanged for nails, beads and other trifles. They behaved quite peaceably, and, having disposed of their cargoes, departed at all times, seemingly, well pleased. We now placed a guard on little island, which, at low water, is joined to Mortuara, called the Hippah, at which place was an old fortified town, that had been abandoned by the natives. We took possession of their houses, and by sinking a fort within side, made them very comfortable. Here our astronomer erected his observatory; at the same time we struck our tents on Mortuara; and having run farther into the cove with the ship, we moored her for the winter, on the west shore, and gave her a winter coat to preserve her hull; then after fending ashore the spars and lumber of the decks to be caulked, we pitched our tents near the river, at the watering-place.

On Tuesday, the 11th of May, several of our crew, who were at work on shore, very sensibly felt the shock of an earthquake, from which circumstance we think it probable, that there are volcanos in New Zealand, as these phenomena generally go together. On the 12th, the weather continuing fair, and the Indians friendly, the Captain and officers were preparing to go ashore, when about nine A. M. no less than ten canoes came paddling down the Sound. We counted one hundred and twenty natives all armed. When along-side of the ship, they expressed a desire to be admitted on board; but Capt. Furneaux, not liking their looks and gestures, gave orders, that a few only should be admitted at a time. These behaved so disorderly that the sailors were obliged to turn them out, and it now appeared plainly that the intentions of our visitors were to make themselves masters of the ship: however, finding the crew to be upon their guard, they became more civil, but not before a great gun was discharged over their heads, which alone intimidated them. Being thus reduced to order, the people on board produced several articles, such as beads, small clasp knives, scissars, cloth, paper, and other trifles, which they bartered for battle axes, spears, weapons of various sorts, fish-hooks, and other curiosities, the manufacture of the country. Being visibly disappointed in the execution of their grand design, they took to their canoes, all gabbling together in a language, a word of which no one on board could understand: but previous to their departure, the captain and officers made presents to those among them who appeared to be their chiefs, which they accepted with great apparent satisfaction.

Three months were now elapsed since the Adventure lost sight of the Resolution; but on the 17th she was seen at Jackson Point. We immediately sent out boats to her assistance, it being calm, to tow her into the Sound. In the evening she anchored about a mile without us, and next morning weighed and warped within us. The pleasure the ships companies felt at meeting can only be conceived by those who have been in like circumstances, each were as eager to relate as the others were to hear. Having thus related the progress of the Adventure, we now come to record the transactions of both ships after their junction. It were little more than a repetition of the Adventure's distresses to recapitulate the effects of the boisterous weather that were felt by the crew of the Resolution; being sometimes surrounded with islands of ice, out of which they could only extricate themselves by the utmost exertion of their skill in seamanship, sometimes involved in sheets of fleet and snow, and in mists so dark, that a man on the fore-castle could not be seen from the quarter deck; sometimes the sea rolling mountains high, while the running tackle, made brittle by the severity of the frost, was frequently snapping, and sometimes rendered immovable. Amidst the hardships of such a traverse, there is nothing more astonishing, than that the crew should continue in perfect health, scarce a man being so ill as to be incapable of duty. Nothing can

redound more to the honour of Capt. Cook, than his paying particular attention to the preservation of health among his company. By observing the strictest discipline from the highest to the lowest, his commands were duly observed, and punctually executed. When the service was hard, he tempered the severity thereof by frequently relieving those employed in the performance, and having all hands at command, he was never under the necessity of continuing the labour of any set of men beyond what their strength and their spirits could bear. Another necessary precaution was, that in fine or settled weather, the captain never suffered any of his men to be idle, but constantly employed the armours, the carpenters, the professed navigators, foremastmen, &c. in doing something each in his own way, which, though not immediately wanted, he knew there might be a call for before the voyage was completed. Having by this means left no spare time for gaming, quarrelling, or rioting, he kept them in action, and punished drunkenness with the utmost severity; and thus by persevering in a steady line of conduct, he was enabled to keep the sea till reduced to a very scanty portion of water; and when he despaired of finding any new land, and had fully satisfied himself of the non-existence of any continent in the quarter he had traversed, he directed his course to Charlotte's Sound, the place appointed for both ships to rendezvous in case of separation, and appeared off the same, (as has been already related) on Tuesday, the 18th of May, 1773, and here we discovered our comfort the Adventure, by the signals she made to us, an event every one in both ships felt with inexpressible satisfaction.

The next morning after our arrival, being Wednesday, the 19th, Capt. Cook went off in the boat, at day-break, to gather scurvy grass, celery, and other vegetables. At breakfast time he returned with a boat load, enough for the crews of both ships; and knowing their salutary efficacy in removing scorbutic complaints, he ordered that they should be boiled with wheat and portable broth, every morning for breakfast, and with pease and broth for dinner, and thus dressed they are extremely beneficial. It was now the Captain's intention to visit Van Diemen's land, in order to determine whether it made a part of New Holland; but as Capt. Furneaux had cleared up this point, it was resolved to continue our researches to the east between the latitudes of 41 deg. and 46 deg. In consequence of this determination Capt. Cook ordered out his men to assist the crew of the Adventure in preparing her for sea. He was induced more especially to this, because he knew refreshments were to be procured at the Society Isles. On the 20th, we visited the fortifications of the natives where the observatory was fixed. It is only accessible in one place, and there by a narrow, difficult path, being situated on a steep rock. The huts of the natives stood promiscuously within an inclosure of pallisades; they consisted only of a roof, and had no walls. Perhaps these are only occasional abodes, when the Indians find themselves in any danger. Capt. Furneaux had planted before our arrival, a great quantity of garden seeds, which grew very well, and produced plenty of salad and European greens. This day Capt. Cook sent on shore, to the watering-place, near the Adventure's tent, the only ewe and ram remaining of those we brought from the Cape of Good Hope. On the 21st we went over to Long Island, which consists of one long ridge, the top nearly level, and the sides steep. Here we found various kinds of stone, and sowed different kinds of garden seeds upon some spots which we cleared for that purpose. On Saturday, the 22d, we found the ewe and ram dead, whose death we supposed to have been occasioned by some poisonous plants. About noon we were visited by two small canoes in which were five men. They dined with us, and it was not a little they devoured. In the evening they were dismissed with presents. They resembled the people of Dusky Bay, but were much more familiar, and did not appear concerned at seeing us, which was probably owing to their having before visited the crew of the Adventure. Some of our crew made

use of their canoes to fet themselves ashore, on which they complained to the Captain; and, upon their canoes being restored, they seemed highly delighted.

On Monday the 24th, early in the morning, Mr. Gilbert, the master, was dispatched to sound about the rock we had discovered in the entrance of the found; at the same time Capt. Cook, accompanied by Capt. Furneaux and Mr. Forster, set off in a boat to the west bay on a shooting party. They met a large canoe, in which were 14 or 15 people; and the first question they asked was concerning the welfare of Tupia. Being told he was dead, they expressed some concern. The same enquiry, as has been observed, was made of Capt. Furneaux when he first arrived, and on our getting aboard in the evening, we were informed, that some Indians in a canoe, who were strangers to our people, had also enquired for Tupia. Mr. Gilbert having sounded all round the rock, which he found to be very small and steep, returned late in the evening. This day the *Resolution* received another visit from a family who came with no other intent than partaking of our food, and to get some of our iron work. We wanted to know their names, but it was a long time before we could make them understand us. At last we found that the oldest was called Towahanga, and the others Kotugha-a, Koghoaa, Khoaa, Kollakh, and Tau-puapera. The last was a boy about twelve years of age, very lively and intelligent. He dined with us, eat voraciously, and was very fond of the crust of a pie made of wild fowl. He did not much relish Madeira wine which the captain gave him, but was very fond of some sweet Cape wine, which elevated his spirits and his tongue was perpetually going. He very much wanted the captain's boat cloak, and seemed much hurt at a refusal. An empty bottle and a table-cloth being also denied him, he grew exceeding angry, and at length was so fullen, that he would not speak a word. On Saturday the 29th instant, a great number of natives surrounded us with canoes, who brought goods to exchange, for which they got good returns, owing to the eagerness with which our sailors outbid each other, all of them being desirous of having some of the productions of this country. Among these Indians we saw many women whose lips were of a blackish hue, and their cheeks were painted with a lively red. They had large knees, and slender bandy legs, owing to want of exercise, and sitting in their canoes cross legged. These ladies were very agreeable to our crews, who had no opportunity of indulging an intercourse with other women since our departure from England; and they soon found out, that chastity was not a distinguishing part of their character. Their consent was easily purchased: a spike nail, or an old shirt, was a sufficient bribe: the lady was then left to make her man happy, and to exact from him another present for herself. We must observe to the credit of some of these women, and to the discredit of their men, that several of the former submitted to this prostitution with much seeming reluctance; and they were sometimes terrified into a compliance by the authority and even menaces of the men. The New Zealanders encouraged by the gain of this disgraceful commerce, went through both the ships, offering their daughters and sisters to the promiscuous embraces of every one for iron, tools, &c. but the married women were not obliged to carry on this infamous kind of traffic. Indeed it seems to be an established custom in New Zealand for a girl to bestow her favour on a number of men, without the least infringement on her character; but after marriage, the strictest conjugal fidelity is expected from her. Sketches of the most characteristic of their faces were taken by our draughtsmen. Several of the old men in particular, had very expressive countenances; and some of the young ones looked very savage, owing to their bushy hair hanging over their faces. Their dress is like what is exactly described in our copper-plates for this work. In the evening they all went on shore, and erected temporary huts opposite to the ships. Here they made fires, and prepared their suppers, which consisted of fresh fish, which they caught with great dexterity. One of these

No. 15.

Indians Capt. Cook took over to Mortuara, and shewed him some potatoes, in a thriving condition, which were planted by Mr. Fannen, master of the *Adventure*. The man was so well pleased with them, that of his own accord, he began to hoe up the earth round the plants. He was then conducted to other plantations of turnips, carrots, and parsnips, of which it was easy to give them an idea, by comparing them with such roots as they were well acquainted with. We must further remark of these people, that not any of our methods of fishing are equal to theirs.

On the 30th instant, we went over to Long Island, to collect some hay which the crews had made, and to bring some vegetables on board. In this trip we found several new plants, and shot some small birds, which we had not seen before. In the afternoon, leave was given to some of our sailors to go on shore, where they again purchased the embraces of the women. These fellows must have been very keen indeed, or they would have been disgusted with the uncleanness of their doxies, all of whom had a disagreeable smell, which might be scented at a considerable distance; and their clothes as well as hair swarmed with vermin to a very great degree; which they occasionally cracked between their teeth. It is surprizing how men, who had received a civilized education, could gratify the animal appetite with such loathsome creatures. While this party were on shore, a young woman on board stole one of our seamen's jackets, and gave it a young man of her own tribe; upon the sailor's taking it from the Indian, he received several blows on the face by the young fellow's fist. At first the sailor took this as in joke, but upon perceiving the assailant to be in earnest, he gave him a hearty English drubbing, and made him cry out for quarters. At this time Capt. Cook continued his employment of sowing, in different spots cleared for the purpose, all sorts of vegetables that he thought would grow in this country, such as potatoes, beans, peas, corn, &c.

On Tuesday the 1st of June, we were visited by several natives whom we had not seen before, and who brought with them sundry new articles of commerce; among these were dogs, some of which we purchased. Of these people we saw a few oddly marked in their faces, by spiral lines deeply cut in them. Such kind of marks were very regular in the face of a middle-aged man, named Tringho Waya, who appeared to be a person of note, and to have authority over his brethren. This company seemed to understand perfectly well how to traffic, and did not like we should make hard bargains. Some of them entertained us with a dance on the quarter deck, previous to which they parted with their upper garments, and stood in a row. They sung a song, and its chorus all together, making during the performance many frantic gestures. Music accompanied this song and dance, but it was not very harmonious.

On Wednesday the 2d, we set ashore on the east-side of the found a male and a female goat. The latter, which was more than a year old, had two fine kids, that were killed by the cold some time before we arrived in Dusky Bay. Capt. Furneaux likewise put on shore, in Cannibal Cove, a boar and two breeding fows, which were left to range in the woods at pleasure. Should they remain unmolested by the natives till they become wild, they will then be in no danger, and in time this country may be stocked with these useful animals. In an excursion made this day by some of our people to the east, they met with the largest seal they had ever seen. They discovered it swimming on the surface of the water, and got near enough to fire at it, but without effect; and after pursuing it near an hour, they were obliged to give over the chase. By the size of this animal, it probably was a sea-lioness; Capt. Cook was of this opinion from having seen a sea-lion when he entered this found, in his former voyage; and he thought these creatures had their abode in some of the rocks, that lie off Admiralty Bay, and in the strait. On the 3d, some boats were sent to Long Island, to bring away the remainder of the hay, and our carpenter

2 L

went

went over to the east-side of the sound, to cut down some spars, which were much wanted. On their return, one of the boats was chased by a large double canoe, containing above fifty men. Prudence dictated to effect an escape by sailing, for though the Indians might have no hostile intentions, yet this was a necessary caution.

Friday the 4th of June, being his Majesty's birthday, we hoisted our colours, and prepared to celebrate the day with the usual festivities. Early in the morning our friends brought us a large supply of fish. One of them promised to accompany us in our voyage, but afterwards altered his mind, as did also some others who had made a like promise to the people of the Adventure. It was very common for these people to bring their children with them, not with the unnatural intention of selling them, as was reported, but in expectation that we would make them presents. A man brought his son, a boy about ten years of age, and presented him to Capt. Cook, who thought at first he wanted to sell him: but we soon found the desire of the father was inclined only towards a white shirt, which was given to his son. The boy was so highly delighted with his new garment, that he went all over the ship, presenting himself before every one who came in his way. This freedom, or perhaps the colour of his dress, or the boy's antic gestures, offended old Will, the ram goat, who by a sudden butt knocked him backwards on the deck. The shirt was dirtied; the misfortune seemed irreparable to the boy, who feared to appear before his father in the cabin, until brought in by Mr. Forster; when he told a very lamentable story against Gourey, the great dog (for so they called all the quadrupeds we had aboard) nor would he be reconciled till his shirt was washed and dried. From this trifling story may be seen how liable we are to mistake these people's meaning, and to ascribe to them customs they are utter strangers to. This day a large double canoe approached, well manned: it came within musket shot, and contained about thirty men. Our friends on board told us they were enemies very earnestly. Among these new visitors, one stood at the head of the canoe, and another at the stern, while the rest kept their seats. One of them held a green bough, the New Zealand flag in his hand, and spoke a few words. The other made a long harangue, in solemn and well articulated sounds. Being invited aboard, he at last ventured, and was followed soon by the rest, who eagerly traded with us. They directly saluted the natives on board, by an application of their noses, and paid the same compliment to the gentlemen on the quarter-deck. The chief's name was Teiratu. They all enquired for Tupia, and were much concerned at hearing of his death. These people were taller than any we had hitherto seen in New Zealand, and their dress and ornaments bespoke them superior to the inhabitants of Queen Charlotte's Sound. Their tools were made with great attention, and were elegantly carved: we obtained a few of these, and also some musical instruments from them. They made but a short stay, and, embarking, they all went over to Mortuara, where, by the help of our glasses, we discovered four or five canoes, and several people on the shore. About noon Capt. Cook, accompanied by several other gentlemen followed them, and were received with every mark of friendship. The captain distributed several presents, among which were a great number of brass medals inscribed with the king's title on one side, and the ship which undertook this voyage on the other. Teiratu appeared to be the chief among these people, by the great degree of respect paid him. Capt. Cook conducted Teiratu to the garden he had planted, and obtained a promise from him that he would not suffer it to be destroyed.

Early in the morning of the 7th of June, we sailed from this place in company with the Adventure, but had frequent hindrances from contrary winds. On the twenty-second of July we were in lat. 32 deg. 30 min. long. 133 deg. 40 min. W. And now the weather was so warm, that we were obliged to put on lighter cloaths. We did not see a single bird this day, which was

rather remarkable, as not one day had hitherto passed since we left the land without seeing several. Capt. Cook having heard that the crew of the Adventure were sickly, went on board the 29th of July, when he found the cook dead, and 20 men ill with the scurvy and flux. Only three men were on the sick list on board the Resolution, which was certainly owing to the captain's absolutely enforcing the eating celery and scurvy-grass with the food, though at first the crew did not like it.

All hopes of discovering a continent now vanished, as we had got to the northward of Capt. Carteret's tracts, and we only expected to see islands till our return to the S. Every circumstance considered, we were induced to believe that there is no Southern Continent between New Zealand and America; it is very certain that this passage did not produce any sure signs of one.

On the 6th of August, Capt. Furneaux came on board the Resolution to dinner, and reported, that his people were much better, that the flux had quite left them, and that the scurvy was at a stand. The scorbutic people had been well supplied with cyder, which in a great measure contributed to this happy change. Land appeared to the south on the eleventh instant at day break, which we judged to be one of those islands discovered by Monf. Bougainville. We called it Resolution Island, it lies in the latitude of 17 deg. 24 min. longitude 141 deg. 39 min. W. We did not stay to examine it, as it did not appear large enough to supply our wants; we therefore determined to make the best of our way to Otaheite, where we were sure of a plentiful supply of refreshments. In the evening we saw land again, which in all probability was another of Monf. Bougainville's discoveries. This we called Doubtful Island. On the morning of the 12th instant at day-break, we discovered land at about two miles ahead of us, so that we were advised of our danger but just in time. This was another small half drowned island. The sea broke against it in a dreadful surf. This island is in latitude 17 deg. 5 min. longitude 143 deg. 16 min. W. We called it Furneaux Island. On the 17th, we saw another of these islands in latitude 17 deg. 4 min. longitude 144 deg. 30 min. W. It is with very great propriety that Monf. Bougainville calls these low overflowed islands the Dangerous Archipelago. We were under the necessity of proceeding with the utmost caution, especially in the night, as we were surrounded by them, which the smoothness of the sea sufficiently indicated. On the 14th, we found ourselves clear of these islands, and steered our course for Otaheite. We saw Osuaburg Island (which was discovered by Capt. Wallis) on the 15th, at five in the morning, and acquainted Capt. Furneaux that it was our intention to put into Oatipha Bay, near the south end of Otaheite, and get what refreshments we could in that part of the island, before we went to Matavai.

On the 18th, we were within a league of the reef. On account of the breeze failing us, we hoisted out our boats to tow the ships off, but they could not keep us from being carried too near the reef. Many inhabitants came on board from different parts, who brought fruits, &c. to exchange; they most of them knew Capt. Cook again, and enquired for Mr. Banks and others, but none of them asked for Tupia. Our situation became still more dangerous as the calm continued. On sending to examine the western point of the reef, in order to get round that way into the bay, we found that there was not sufficient depth of water. Both ships were carried with great impetuosity towards the reef, and all the horrors of shipwreck now stared us in the face. The breakers were not two cables length from us, and we could find no bottom to anchor. The Resolution came at three fathoms water, and struck at every fall of the sea, but the Adventure brought up under our bow without striking. The dreadful surf which broke under our stern threatened our shipwreck every moment. At length we found ground a little without the basin, and got the ship afloat by cutting away

away the bower anchor, and the tide ceased to act in the same direction. We happily towed off the Resolution, and all the boats were ordered to assist the Adventure. We happily got once more safe at sea, after narrowly escaping shipwreck. A number of the natives were on board the ships while we were in this perilous situation, but were totally insensible of any danger, even while we were striking, and when they parted with us they seemed quite unconcerned. We anchored in Oati-piha Bay, very near the shore, and were visited by a great number of the natives, who brought roots, fruit, &c. Presents were made to their chiefs of shirts, axes, and other articles, in return for which they promised hogs, fowls, &c. but we believe they never intended to keep their promise. In the afternoon, Captains Cook and Furneaux landed to sound the disposition of the natives, and to view the watering-place. The natives behaved with great civility, and we had a very convenient supply of water.

We recovered the Resolution's bower anchor, which we were obliged to leave; but the Adventure lost three in the time of our extremity, which were never recovered. We were still supplied with fruit and roots, but not in large quantities. A party of men were trading on shore, under the protection of a guard. We could not get any hogs from the natives, though plenty were said to be seen about their habitations, they all said they belonged to Waheatow, their chief, whom we had not seen. A man who pretended to be a chief came on board with several of his friends, to whom presents were made, but he was detected in handing several things over the quarter gallery; and as complaints of the same nature were alledged against those on the deck, the captain took the liberty to turn them all out of the ship. The captain was so exasperated at the conduct of the pretended chief, that he fired two muskets over his head, which terrified him so much, that he quitted his canoe and took to the water. On sending a boat to take up the canoe, the people from the shore pelted the boat with stones. The captain went himself in another boat to protect her, he likewise ordered a cannon loaded with ball to be fired along the coast, which terrified them sufficiently, and he brought away the canoes without any opposition. They soon became friends again, and the canoes were returned. Two or three people began to enquire after Tupia, but they were soon satisfied when they heard the cause of his death. Several people asked for Mr. Banks, and other people who were at Otaheite with Capt. Cook before. We were informed by these people, that there had been a battle fought between the two kingdoms, that Toutaha, the regent of the greater peninsula, was slain, and that Otoo reigned in his stead. In this battle Tubourai, Tamaide, and several of our old friends fell. A peace was now fully established.

On the 19th, the two commanders made an excursion along the coast, and were entertained by a chief (whom they met) with some excellent fish, &c. to whom in return they made several presents. On the 20th, one of the natives stole a gun from the people on shore. Some of the natives pursued him of their own accord, who knocked him down and brought back the musket. We imagine that fear operated more with them in this business than any other motive. On the 21st, a chief came to visit us, who brought in a present of fruit, which proved to be some cocoa-nuts that we had drawn the water from and thrown overboard. He had so artfully tied them up, that we did not soon discover the deceit. He did not betray the least emotion when we told him of it, and opened two or three of them himself, as if he knew nothing of the matter; he then pretended to be satisfied that it was really so, and went on shore, from whence he sent some bananas and plantains. We were informed that Waheatow was come into the neighbourhood, and wished to see Capt. Cook, who accordingly went in company with Capt. Furneaux and some gentlemen: they were likewise attended by some natives. About a mile from the landing place they met the chief, advancing to meet them with a numerous train. When

the prince perceived the company, he halted. He knew Capt. Cook very well, as they had seen each other several times in 1769. He went at that time by the name of Terrace, and took his father's name at his death. We found him sitting on a stool; and as soon as the usual salutation was over, he seated Capt. Cook on the same stool with himself; the rest sat on the ground. He enquired after several who had been on the former voyage, and seemed sorry when we told him we must sail the next day, offering the captain that if he would stay he should have hogs in plenty. Capt. Cook made him many presents, and staid with him the whole morning. This party returned on board of ship to dinner, and made this chief another visit in the afternoon, made him more presents, and he gave us two hogs. At the different trading places some others were got, so that a meal's fresh pork served for the crews of both ships.

Early in the morning of the 24th, we put to sea, and were accompanied by several canoes, who brought cargoes of fruit for sale; neither did they return till they had disposed of them. The sick people on board the Adventure got much relief from these fruits. We left a lieutenant on shore, in order to bring some hogs, which they promised to send by him. He returned on the 25th, and brought eight pigs with him. We arrived at Matavai Bay in the evening of the 25th, and our decks were crowded with natives before we could get to anchor, almost all of them were acquainted with Capt. Cook. Otoo their king and a great crowd were got together on the shore. Capt. Cook was going on shore to pay him a visit, but was told that he was gone to Oparee in a fright; which seemed very extraordinary to the captain, as all others were much pleased to see him. Maritata, a chief, was on board, and advised the captain to defer his visit till next morning. The captain set out on the 26th for Oparee, after having given directions to fetch tents for the reception of the sick, &c. Capt. Furneaux, Maritata and his wife, and some others, went with the captain. They were conducted to Otoo as soon as they were landed, who sat on the ground under a shady tree, with a great number of people around him. Capt. Cook made him several presents, after the usual compliments had passed, being very well persuaded that it was much to his interest to establish a friendship with this man. His attendants also had presents made to them, they offered cloth in return, which was refused, being told that what was given was merely out of friendship. Otoo enquired for all the gentlemen who had been there before, as well as for Tupia, and promised to send some hogs on board, but was very backward in saying he would come on board himself, being, as he said, much afraid of the great guns. He was certainly the most timid prince, as all his actions demonstrated. He was a personable well made man, six feet high, and about thirty years of age. His father and all his subjects were uncovered before him, that is, their heads and shoulders were made bare.

On the 27th, the king Otoo came to pay us a visit, attended by a numerous train; he sent before him two large fish, a hog, some fruits, and a large quantity of cloth. After much persuasion he came on board himself, accompanied by his sisters, a younger brother, &c. with many attendants, who all received presents; and when they had breakfasted, carried them home to Oparee. Upon landing, an old lady, the mother of Toutaha, met Capt. Cook, seized him by both hands, and, weeping bitterly, told him that her son and his friend Toutaha were dead. Had not the king taken her from Capt. Cook, he must have joined her lamentations. It was with a good deal of difficulty that the captain prevailed on the king to let him see her again, when he made her some presents. Capt. Furneaux gave the king a male and female goat, which we hope will multiply. A lieutenant was sent to Attahourou on the 28th, to purchase hogs. The king, with his sister and some attendants, paid us another visit soon after sun-rise, and brought with them a hog, some fruit, and some more cloth. They likewise went on board the Adventure,

Adventure, and made Capt. Furneaux the same presents. Soon after they returned, and brought Capt. Furneaux with them. Capt. Cook made them a good return for the presents they brought, and dressed out the king's sister to the greatest advantage. The king was carried again to Oparee, when his Otahaitan majesty thought proper to depart, and was entertained as he went with bagpipes and the seamen dancing. Some of his people danced also in imitation of the seamen, and performed their parts tolerably well. Toutaha's mother again presented herself to Capt. Cook; but could not look upon him without shedding many tears. The next day the king promised to visit us again, but said we must first wait upon him. The lieutenant whom we sent for hogs returned only with a promise of having some, if he would go back in a few days.

On the twenty-ninth the commanders took a trip to Oparee, early in the morning, attended by some officers and gentlemen, and made the king such presents as he had not before seen. One of them was a broad sword; at the sight of which he was very much intimidated, and desired it might be taken out of his sight. With a vast deal of argument he was prevailed upon to suffer it to be put on his side, where it remained a very short time. We received an invitation to the theatre, where we were entertained with a dramatic piece, consisting of comedy and dance. The subject we could not well find out; though we heard frequent mention of Capt. Cook's name during the performance. The performers were one woman, which was no less a personage than the king's sister, and five men, and their music consisted of only three drums. The whole entertainment was well conducted, and lasted about two hours. When this diversion was over, the king desired us to depart, and loaded us with fruit and fish. The king sent more fruit and fish the next morning.

In the evening of the thirtieth we were alarmed with the cry of murder from the shore. A boat was immediately armed, and sent on shore, to bring off any of our people who might be found there without orders, and to discover the occasion of the disturbance. The boat soon returned, with a seaman and three marines; others were taken, who belonged to the Adventure, and even put under close confinement till the morning, when they were severely punished according to their demerits. The people would not confess any thing, and it did not appear that any material injury had been done. The disturbance might be occasioned by the fellows making too free with the women: notwithstanding this, the alarm was so great, that the natives fled from their habitations in the night; and the inhabitants of the whole coast were terrified. The king himself had fled a great way from the place of his abode; and when Capt. Cook saw him, he complained to him of the disturbance. Capt. Cook presented the king with three Cape sheep, as it was his last visit. With this present he was very well pleased, though he had not much reason to be so, as they were all weathers; this he was made acquainted with. The king's fears were now dissipated, and he presented us with three hogs, one of which was very small, which we took notice of. Soon after a person came to the king, and seemed to speak very peremptorily about the hogs, and we thought he was angry with him for giving us so many, and more so when he took the little pig away with him; but we were much mistaken, for soon after we were gone, another hog was brought to us, larger than the other two. The king seemed much affected when Capt. Cook told him he should leave the island the next day. They embraced each other several times, and departed.

On the first of September we determined to depart, as the sick were nearly recovered, the necessary repairs of the ship were completed, and plenty of water provided. Most of the day was employed in unmooring the ships; and in the afternoon the lieutenant returned, who had been sent for the hogs promised. With him came Pottatou (the chief of the district of Attahounou), with his wife, to pay Capt. Cook a visit, and

made him a present of two hogs and some fish. The lieutenant got likewise two more hogs. As the wind was westerly, we were obliged to dismiss our friends sooner than they wished; but they were very well satisfied with the reception they met with. A young man, named Poreo, came on board some hours before we got under sail, and desired to go with us, to which we consented; and at the same time he asked for an axe and a spike nail for his father, who came with him on board. They were accordingly given him, and they parted with great indifference, which seemed to indicate that they had deceived us, and no such consanguinity subsisted. Presently a canoe, conducted by two men, came along-side, and demanded Poreo in the name of Otoo. We informed them that we would part with him if they would return the hatchet and spike nail, but they said they were ashore; so the young gentleman sailed along with us, though he wept when he saw the land at our stern. On the second we steered our course for the island of Huaheine, and the Resolution anchored in twenty-four fathoms water on the third instant, but the Adventure got ashore on the north side of the channel, but she was happily got off again without receiving any damage. The natives received us with the utmost cordiality, several of whom came on board before our commanders went on shore. Some presents were distributed amongst them, which were gratefully returned by a plentiful supply of hogs, fruit, &c. Here we had a fine prospect of being plentifully supplied with fresh pork and fowls, which was to us very pleasing. Two trading parties were sent ashore on the fourth instant, which were very well conducted. Capt. Cook was informed that Oree was still alive, and waited to see him. The commanders, with Mr. Forster, went to the place appointed for the interview, accompanied by one of the natives. The boat was landed before the chief's house, and we were desired to remain in it till the necessary ceremony was gone through. There stood close to the shore five young plantain trees, which are their emblems of peace: these were, with some ceremony, brought on board separately. The first three were each accompanied by a young pig, whose ears were ornamented with cocoa-nut fibres; the fourth plantain tree was accompanied by a dog. All these had particular names and meanings, which we could not understand. The chief had carefully preserved a piece of pewter, with an inscription on it, which Capt. Cook had presented him with in 1769, together with a piece of counterfeit English coin, which, with a few beads, were all in the same bag the captain made for them; these the chief sent on board. This part of the ceremony being over, we were desired by our guide to decorate three young plantain trees with nails, looking-glasses, beads, medals, &c. With these in our hands we landed, and were conducted through the multitude. We were directed to sit down a few paces before the chief, and the plantains were laid one by one before him. We were told that one was for God, another for the king, and the third for friendship. This being done, the king came to Capt. Cook, fell on his neck, and kissed him. A great effusion of tears fell down the venerable cheeks of this old man; and if ever tears spoke the language of the heart, surely these did. Presents were made to all his attendants and friends. Capt. Cook regarded him as a father, and therefore presented him with the most valuable articles he had. He gave the captain a hog, and a good deal of cloth, with the promise that all his wants should be supplied. Soon after we returned on board, fourteen hogs were sent us, with fowls and fruit in abundance. In the morning of the fifth instant we were visited by this good old man, who brought a hog and some fruit; indeed he sent the captain every day ready dressed fruit and roots in great plenty. This morning the lieutenant went on shore in search of more hogs, and returned in the evening with twenty-eight, and about seventy more were purchased on shore.

On Monday the sixth of September the trading party went on shore as usual; it only consisted of three people. Capt. Cook went on shore after breakfast, and learnt

learnt that one of the inhabitants had been very insolent and troublesome. This man was shewn to the captain, equipped in his war habit, and he had a club in each hand. The captain took these from him, as he perceived him bent on mischief, broke them before his face, and obliged him to retire. The captain being informed that this man was a chief, became a little suspicious of him, and sent for a guard. About this time a gentleman had gone out botanizing alone; two men assaulted him, and stripped him of every thing but his trowsers; luckily they did him no harm, though they struck him several times with his own hanger. They made off when they had done this, and another of the natives brought a piece of cloth to cover him. This gentleman presently appeared at the trading place, where a number of the natives were assembled, who all fled at seeing him. Capt. Cook persuaded some of them to return, assuring them that none should suffer who were innocent. When the king heard this complaint, he and his companions wept bitterly; and as soon as his grief was assuaged, he made a long harangue to the people, telling them the baseness of such actions, when the captain and his crew had always behaved so well to them. He then took a particular account of the things the gentleman had lost, and promised they should be returned, if it was in his power to find them. After this he desired Capt. Cook to follow him to the boat, but the people being apprehensive of his safety, used every argument to dissuade him from it. It is impossible to describe the grief they expressed in the intricacies they used; every face was bedewed with tears, and every mouth was filled with the most dissuasive arguments. Oree was deaf to them all, and insisted on going with the captain; when they both were in the boat, he desired it might be put off. The only person who did not oppose his going, was his sister, and she shewed a magnanimity of spirit equal to her brother. We proceeded in search of the robbers, as far as it was convenient by water, and then landed. The chief led the way, travelled several miles, and enquired after them of all he saw. We then went into a cottage, and had some refreshment. The king wanted to proceed farther, and was with great difficulty dissuaded from it by Capt. Cook. When we returned to the boat, we were met by the king's sister, who had travelled over land to that place, accompanied by several other persons. The king insisted on going into the boat with us, as well as his sister. We returned to the ship, and the king made a very hearty dinner; though his sister, according to custom, ate nothing. We made them suitable presents for the confidence they had placed in us, and set them ashore amidst the acclamations of multitudes. Peace was now perfectly re-established, provisions poured in from all quarters, the gentleman's hanger and coat were returned, and thus ended these troublesome transactions.

We went to take our leave of Oree while the ships were unmooring, and presented him with things both valuable and useful. We left him a copper-plate, with this inscription. "Anchored here, his Britannic Majesty's ships Resolution and Adventure, September 1773." After we had traded for such things as we wanted, we took our leave, which was a very affectionate one. On returning to the ships, they were crowded, as on our arrival, with canoes filled with hogs, fowls, &c. Soon after we were on board, the king came, and informed us that the robbers were taken, and desired us to go on shore, that we might behold their exemplary punishment. This we should have been glad to have done, as so much pains had been taken to discover them; but it was out of our power, as the Adventure was out of harbour, and we were under sail. The good old king staid with us till we were near two miles out at sea, and then, after taking another affectionate leave, parted. During our stay here, we procured upwards of three hundred hogs, besides fowls and fruit in great abundance. While at this island, Capt. Furneaux engaged a young man, named Omai, a native of Ulitea, who had been dis-

No. 16.

possessed of his property by the people of Bolabola, to accompany him on his voyage. This young man has a good understanding, honest principles, and a natural good behaviour. But his history is so well known in England, that we will not enlarge upon it.

On Wednesday the 8th, we entered the harbour of Ohamaneno; the natives crowded about us with hogs and fruit as soon as we were anchored. We refused the hogs, as we had already more than we could manage; but several of the principal people obliged us to take them whether we would or no. We made a visit on the 9th to Oreo, who is the chief of this part of the island of Ulitea. He expressed great satisfaction on seeing Capt. Cook again, and desired him to exchange names with him, which the latter agreed to: this is a distinguishing mark of friendship. Here we traded as usual, but the balance of trade was much in our favour. On the 10th, the chief entertained us with a comedy; a very entertaining part of which was a theft, committed, with amazing dexterity, by a man and his accomplice. Before the thief has time to carry off the prize, he is discovered, and a scuffle ensues; the discoverers are vanquished, and the thieves go off in triumph. We returned to dinner after the play was over, and as we were walking on shore in the evening, one of the natives informed us that there were nine uninhabited islands to the westward.

Oreo and his son paid us a visit early in the morning of the 11th of September, and brought, as usual, hogs and fruit with them. We dressed the youth in a shirt, and some other articles, of which he was not a little proud. After staying some hours, they went ashore, and so did Capt. Cook soon after, but to another part of the shore. When the chief heard he was landed, he went of his own accord and put a hog and some fruit in the boat, and returned without saying any thing of it to any other person. He afterwards came with some friends to dinner. After dinner, Po-oorau, who is the most eminent chief of the island, made us a visit. He was introduced by Oreo, and brought a present with him; for which he received a handsome return. We promised to visit both the chiefs the next morning: which we accordingly did, in company with several gentlemen. Another play was acted, and two very pretty young women performed, otherwise this piece was not so entertaining as the one we saw before.

On the 14th, we sent on shore for a supply of bananoes and plantains, for sea store. Oreo and some friends paid us a pretty early visit, when we informed him, that we would dine with him on shore, and desired he would let us have two pigs for dinner, dressed in their fashion. We found the floor of the chief's house strewn thick with leaves, and we were soon seated round them. Soon after the pigs came tumbling over our heads upon the leaves; and they were both so hot as scarcely to be touched. The table was ornamented with hot bread-fruit and plantains: we had likewise a quantity of cocoa-nuts to drink. We never saw victuals dressed cleaner nor better in our lives, and it had a most exquisite flavour, much superior to victuals dressed in our mode; how they contrived it we cannot tell, but though one of these hogs weighed fifty pounds at least, it was well done in every part, and not too much done in any. Oreo and his son, with some male friends, dined with us. We had a great number of attendants and people who came to see us thus dine in public, to whom pieces of pork were handed. The chief did not refuse his glass of Madeira whenever it came to his turn, and we never at this, or any other time, saw him affected by it. The boat's crew took the remainder when we had dined. In the afternoon we were again entertained with a play.

On the 15th, we had a sufficient proof of the timorous disposition of these people. We rather wondered that none of them came to the ships as usual. We were afraid that as two men of the Adventure's crew staid out all night contrary to orders, that the natives had stripped them, or done them some other injury, and were afraid we should revenge their conduct. We

2 M

went

went ashore, and found the neighbourhood nearly deserted. Presently the two men made their appearance, and reported that they had been very civilly treated. We could get no account of the cause of their flight, and could only learn from a few persons who ventured near us, that several were killed and wounded, and pointed to their bodies where the balls of the guns went in and out. Capt. Cook was very uneasy at this relation, fearing for the safety of the people gone to Otaha. In order to get the best information, the captain determined to go to the chief himself, whom, after much searching for, he found seated under the shade of a house, with a great many people round him. There

was a great lamentation as soon as Capt. Cook approached, the chief and all his company bursting into tears. After all this piece of work, it was found that the cause of their alarm was on account of our boats being absent, supposing that the people in them had deserted us, and that we should adopt violent methods to recover them. They were satisfied when Capt. Cook assured them there was no cause for alarm, and that the boats would certainly return. On the morning of the 16th, we paid the chief a visit, who was in his own house in perfect tranquillity. At this time Porco left us.

C H A P. III.

A Spanish ship visits Otaheite—State of the islands—Remarks on the diseases and customs of the natives—Mistaken notions concerning the women, corrected—Passage from Ulitea to the Friendly Isles—Hervey's Island discovered—Incidents at Midleburgh—The two ships arrive at Amsterdam—A place of worship described—Incidents that happened during their stay at that island—The above islands described—Their produce—Cultivation—Houses—Canoes—Navigation—Manufactures—Weapons—Customs—Government—Religion and language of the inhabitants.

ON the 17th of September, being Friday, we determined to put to sea, having a good supply of all kinds of refreshments. Before we sailed, Oreo and his son paid us a visit. Several canoes filled with fruit and hogs surrounded us: of the latter we could receive no more, our decks being so crowded with them that we could scarcely move. In both ships were about three hundred and fifty. Oreo and his friends did not leave us till we were under sail, and earnestly importuned us to tell them when we should return. Capt. Cook, as many young men offered to come away with us, took one on board, about 18 years of age, named Oedidee, a native of Bolabola, and a near relation of the great Opoony, chief of the island. When we were out of the harbour and had made sail, a canoe was observed following us conducted by two men; whereupon we brought to, and when along-side, they delivered to Capt. Cook a present of roasted fruit, and roots, from Oreo. The captain after having made them a proper return set sail to the west, with the Adventure in company. We shall here give some further account of these islands, some things, which are rather interesting, having been omitted in the relation of daily transactions and incidents.

A few days after our arrival at Otaheite we were told, that a ship, about the size of the Resolution, had visited Owhaiurua Harbour, at the S. E. end of the island; at which place, after having remained three weeks, she departed about three months before our arrival. Four of the natives went away in her, whose names were Debedehea, Paodou, Tanadooce, and Opahiah. We conjectured she was a French ship, but at the Cape of Good Hope, we were informed she was a Spaniard, sent out from America. The natives of Otaheite complained of a disorder communicated to them by the people in this ship, which they described as affecting the head, throat, and stomach, and at length they said it killed them. This ship they called Pahai-no Peppe (ship of Peppe) and the disease they named Apano Pep-pe, just as they call the venereal disease Apano Pretane (English disease) yet to a man, they say this loathsome distemper was introduced among them by M. de Bougainville; and they thought he came from Pretane, as well as every other ship that touched at the island. We were of opinion, that long before these islanders were visited by Europeans, this, or a disease near a-kin to it, had existed among them; for they told us people died of a disorder, which we imagined to be venereal, before that period. But be this as it may, the disease is far less common among them than it was in 1769, when we first visited these isles.

In the years 1767 and 1768, the island of Otaheite, as it were, swarmed with hogs and fowls; but at this time it was so ill supplied with these animals, that

hardly any thing could tempt the owners to part with them; and the little stock they had seemed to be at the disposal of their kings. When we lay at Oaiti-piha Bay, in the kingdom of Tiarrabou, or lesser Peninsula, we were given to understand, that every hog and fowl belonged to Waheatoua; and that all in the kingdom of Opoureonu, or the greater Peninsula, belonged to Otoo. While at this island we got only 24 hogs in 17 days; half of which came from the kings themselves, and the other half we were inclined to think were sold us by their permission. But with respect to all the fruits produced in the island, with these we were abundantly supplied, except bread-fruit, which was not in season. Cocoa-nuts and plantains, we got the most of; the latter, with a few yams and other roots, supplied the place of bread. At Otaheite we procured great plenty of apples, and a fruit resembling a nectarine, called by the natives Aheeya. This fruit was common to all the isles. Of all the seeds, brought by Europeans to those islands, none thrived so well as pumpkins, but these they do not like. We attributed the scarcity of hogs to two causes: first to the great number of these animals which have been consumed, and carried away for stock, by the ships that have touched here of late years; secondly, to the frequent wars between the two kingdoms. Two we know have commenced since the year 1767; but at present peace reigns among them, though they do not seem to entertain a cordial friendship for each other. We could not learn the occasion of the late war, nor who were victorious in the conflict; but we learnt, that in the last battle which terminated the dispute, numbers were killed on both sides. On the part of Opoureonu, Toutaha, our very good friend was killed, and several other chiefs. Toutaha was buried in his family Morai at Oparree; and several women of his household, with his mother, are now under the protection, and taken care of by Otoo, the reigning prince; one, who did not appear to us, at first, to much advantage. We could learn but little of Waheatoua of Tiarrabou; but we observed, that this prince, not more than 20 years of age, appeared in public with all the gravity of a man of fifty; yet his subjects do not uncover before him, or pay him that outward obeisance as is done to Otoo; yet they shewed him equal respect, and when abroad, or in council, he took upon him rather more state. His attendants were a few elderly men, who seemed to be his principal advisers. Such was the present state of Otaheite, but the other islands, that is Huahine, Ulitea, and Otaha, appeared in a more flourishing condition, than they were at the time when we first visited them; since which, having enjoyed the blessings of peace, the people possess not only the necessaries, but many of the luxuries of life in great profusion: but

as we have treated at large of these islands in our journal and narrative of Capt. Cook's first voyage, we shall not trouble our readers with unnecessary repetitions; but only add, under this head, new matter, or clear up any mistakes, and seeming inconsistencies. In our first voyage to these places, we were inclined to believe that the natives at times offered to their supreme deity human sacrifices. To clear up this matter the two captains, Cook and Furneaux, with some others went to a Marai, in Matavai. In our company we had, as upon all other occasions, an intelligent, sensible man, belonging to the Resolution, who spoke the language of the natives tolerably well. In this Marai, or burying place, was a Tupapow, on which lay a dead body, and some viands. We first enquired, if the plantains, &c. before us, were for the Etua, and if they offered to him hogs, dogs, and fowls? They answered in the affirmative. We then, after a few more introductory questions, asked, if they sacrificed any of the human species to the Etua? They answered, yes, Taata-eno, that is bad men, who they first beat till they were dead; but good men were not sacrificed. We asked him if any Earces were? They replied, that hogs were given to Etua, and only Taata-eno. All the answers seemed to tend to the same point, and meant, that men for certain crimes were condemned to be sacrificed, provided they had not wherewithal to redeem themselves, and such will generally be found among the lower class of people. But, notwithstanding those of whom these enquiries were made took some pains to explain the whole of this religious rite, yet we were not sufficiently acquainted with their language to make ourselves complete masters of the subject; but we have not the least doubt remaining of the certainty of the fact, having since been informed by Onai, that it is undoubtedly a custom with them to offer human sacrifices to the Supreme Being. The object, according to his account, or who shall be sacrificed, depends solely on the pleasure of the high priest, who, on any solemn occasion, retires alone into the temple, and, when he comes from thence, informs the people, that he has seen and talked with the Etua; (the high priest only having this privilege) that he requires a human sacrifice; and that such a particular person is the man, whom he names, and who immediately is killed, falling most probably a victim to the priest's resentment.

These people have a simple, but, to us, a nauseous manner, of preparing the plant called Ava-ava, which we have noticed in the first part of this work. This is pressed from the roots, and not from the leaves, as we first thought. The makers of the liquor chew a quantity of the root till it is soft and pulpy; then every one spits the juice he has pressed out into one and the same platter. When a sufficiency for their use is thus procured, more or less water is mixed with it, according to the strength required; after which the diluted liquor is strained through some fibrous stuff like fine shavings. Having undergone this process, it is fit for drinking, which is always done immediately. It drinks flat and insipid, but has a pepperish taste; and an intoxicating quality, the effect of which we saw in one instance; however, the natives drink it, for that reason, with great moderation, and but little at a time. The root is sometimes chewed by them as the Europeans do tobacco, and sometimes we have seen them eat the same. Great quantities of this plant are cultivated at Ulitea, at Otaheite very little; but we believe there are few islands in this sea that do not produce more or less of it.

We must not omit to remark here, that great injustice has been done the women of the Society Isles, by those who have represented them as a race of prostitutes without exception, who will sell their favours for gain to any purchaser, which is far from being true; for the enjoyment of either the married or unmarried women, of the higher and middling classes, is a favour as difficult to be obtained here, as in any other country whatever, and even many women in the lower class will admit of no such familiarities. That the proportion

of prostitutes are greater than that of other countries may be true, and most of them were such who frequented our ships and tents on shore. By observing these to mix indiscriminately with women of the first rank, we concluded hastily, that all females were of the same turn, and that the only difference was in the price; but the truth is, as we have more than once before observed, the woman who prostitutes herself, does not seem, in the popular opinion, to have committed a crime, which ought to exclude her from the esteem and society of the community in general. It must be confessed that all the women in this part of the world are complete coquets, and that few among them fix any bounds to their conversation; therefore it is no wonder that they have obtained the character of women of pleasure; yet we should think it very unjust, if the ladies of England were to be condemned in the lump, from the conduct of those on board of ships in our naval ports, or of those who infest the purlieus of Covent-garden, and Drury-lane.

Respecting the geography of these isles, we think it necessary to add to what has been said in the narrative of our former voyage, that we found the latitude of the bay of Oatipaha, in Otaheite, to be 17 deg. 46 min. 28 sec. S. and the east longitude from Point Venus, to be 0 deg. 21 min. 25 sec. and an half, or 149 deg. 13 min. 24 sec. W. from Greenwich. It is highly probable, that the whole island is of greater extent than at first we supposed it to be in 1769, by two miles, and 4 in. 3 quarters respectively. When our astronomers made their observations on Point Venus, they found the latitude to be 17 deg. 29 min. 13 sec. S. which differs but two seconds from that determined by Mr. Green and Capt. Cook; and its longitude, namely, 149 deg. 34 min. 49 sec. and an half W. may be as accurately laid down, for any thing yet known to the contrary.

After our departure from the Society Isles, and leaving Ulitea, it was our intention to get into the latitudes of the islands of Middleburgh and Amsterdam, to which end, on Friday the 17th of September, we steered to the west, inclining to the south, with a view of getting clear of the tracks of former navigators. We proceeded at night with great circumspection, frequently laying to, lest we should pass any land unobserved. On the 21st, and the whole of the 22nd, we had rain, thunder, lightning, a large swell from the south, and the wind blew from the N. W. for several days; a sign to us, that, in that direction, no land was near us. This was discovered from the mast-head, on Thursday, the 23d, stretching from S. by W. to S. W. by S. We hauled up with the wind at S. E. and found it to consist of two or three small islets, united by breakers, as are most of the low isles in the sea; the whole being in a triangular form, and about six leagues in circuit. This island is in latitude 19 deg. 18 min. S. and in 158 deg. 54 min. W. longitude. Each of the small connected isles are clothed with wood, particularly of the cocoa-nut kind; but we saw no traces of inhabitants, and had reason to believe there were none. To these islets we gave the name of Hervey's Island, in honour of Capt. Hervey of the navy, one of the lords of the Admiralty, and now earl of Bristol. As the landing on this isle would have occasioned a delay, we resumed our course to the west, in which we saw some men of war, tropic birds, and flying fish. On Saturday, the 25th, we again began to use our sea biscuit, the fruit being all consumed; but of fresh pork each man had every day a necessary allowance. On Wednesday, the 29th, in latitude 21 deg. 26 min. S. we altered our course at noon W. half S.

On Friday, the 1st of October, at two o'clock P. M. we made the island of Middleburgh, and the next morning bore up for the west side thereof, passing between the same, and a small island that lay off it, where we found a clear channel two miles broad. After running about two thirds of its length, half a mile from the shore, we observed it assumed another aspect, and offered a prospect both of anchorage and landing. Upon this we plied in under the island. We were now visited by two canoes, which came boldly along-side of

us,

us, and several of the Indians entered the Resolution without hesitation; which mark of confidence determined us to visit them if possible. After making a few trips, we found good anchorage, and came to in 25 fathoms water, at three cables length from the shore. We had scarcely anchored, when we were surrounded with Indians, some in canoes, and some swimming, several came on board, and among them a chief, named Tioony, to whom Capt. Cook presented a hatchet, spike-nails, and other articles, with which he was highly pleased. A party of our people, in company with Tioony, went on shore, who were conducted to a little creek formed by the rocks, right abreast of the ships, where landing was very easy, and the boats secure against the surf. Here we were saluted with loud acclamations, by an immense croud of people, who shewed the most evident signs of pacific intentions, not one of them having so much as a stick, or any weapon in their hands. They thronged so thick round the boats with cloth, matting, &c. that it was some time before we could make good our landing. Many of them, who could not get near the boats, threw over the others heads whole bales of cloth, and retired immediately, without either asking, or waiting to get any thing in return. At length the chief caused them to open to the right and left, and make room for us to land. We were then conducted up to his house, which was situated about 300 yards from the sea, at the end of a fine lawn, and under some shaddock trees. In the front was the prospect of the sea, and the ships at anchor. Plantations abounding with the richest productions of nature, were placed behind, and on each side. We were seated on mats, laid on the floor, and the natives placed themselves in a circle round on the outside. Having with us bag-pipes, Capt. Cook ordered them to be played, and in return, the chief directed three young women to sing a song, which they did with an exceeding good grace: and a few presents being distributed among these young women, set all the rest in the circle singing, who did not sit down unrewarded. Their songs were in no wise harsh, but on the contrary musical and harmonious. Having continued here some time, at our own request, we were conducted to another plantation, where the chief had a house, into which we were introduced. Bananoes and cocoa-nuts were set before us, and a bowl of liquor, prepared in our presence, of the juice of ava, in the manner already related; the latter of which was presented to each of us in cups made by the folding of green leaves, containing near half a pint each cup; but Capt. Cook was the only person who tasted the liquor: however the bowl was soon emptied by the natives, of which both men and women partook; but we observed that the same cup was never filled twice, nor did two persons drink out of it; each had a fresh cup and fresh liquor. The house we were now entertained in was situated at one angle of the plantation, abounding with fruit and trees, whose fragrance diffused a pleasing odour, and the spreading branches made an agreeable shade. Before the house was an area, on which we were seated. It being now noon, we returned on board to dinner, with the chief Tioony in our company. We had on the table fresh pork, but he eat nothing, which we thought somewhat extraordinary. After dinner we again went on shore, and were received as before. Mr. Forster, with his botanical party, and some other gentlemen, took a walk into the country. Our two captains were conducted to the chief's house, where fruit, and some greens were set before us. Having just dined we could not eat much, but Oodidee and Omai did honour to the desert. We now intimated a desire of seeing the country, and Tioony very readily gratified our wishes. He led us through several plantations, laid out with great judgment, and inclosed with fences made of reeds. Most of them belonged to our hospitable chief, and were all in very good order, and planted with various fruit trees. Hogs and very large fowls, the only domestic animals we saw, were running near the houses, and in the lanes that separated the plantations. Every person was very much pleased with this delight-

ful country, and the friendly reception we met with, and we much regretted, that the season of the year, and other circumstances, would not permit our longer stay. In the evening we returned on board, and on Saturday the 2d of October, the ships were crowded with people the whole day, trafficking in perfect good order. On the 3d, early in the morning, while the ships were preparing to get under sail, Captains Cook and Furneaux, accompanied by Mr. Forster, went off in the boat, to take leave of our hospitable chief. He met us at the landing-place, and had we not excused ourselves, he would have entertained us at his house. We therefore spent half an hour with him, seated on the grass, in the midst of a vast crowd of the natives, who seemed to vie with each other in doing what they thought would give us pleasure. Having made the chief a present, consisting of various articles, he was given to understand that we were going away, at which he seemed not at all affected. He went with us into our boat, with two of his friends, intending to accompany us aboard, but when he saw the Resolution under sail, he and his companions went into a canoe, and returned on shore. It is remarkable, that on shore this friendly Indian never made the least exchange; but now, during his stay in the boat, he bartered fish-hooks for nails, and engrossed the trade in a manner wholly to himself.

On Saturday, October the 3d, as soon as Capt. Cook came on board, we departed from Middleburg, and made sail down to Amsterdam. When we were about half way between the two isles, we were met by three canoes, and the people made several attempts to come on board, but without effect, as the rope we threw out to them broke, and we did not shorten sail. They were likewise unsuccessful in boarding the Adventure. We ran along the south-west coast of Amsterdam, at the distance of half a mile from the shore, whereon the sea broke in a great surf. By the help of glasses, we saw the face of the whole island, which, in every part that came under our observation, appeared covered with plantations. Along the shore we perceived the natives running in great numbers, and displaying small white flags, the emblems of peace, which signals we answered by hoisting a St. George's Ensign. At this time three of the natives of Middleburg, who had continued too long on board the Adventure to return, quitted her, and swam to the shore, from whence we concluded they had no strong inclination to accompany us in our voyage. We had no sooner opened the west side of the isle, than several canoes, having four men in each, came boldly along-side, and, when they had presented us with some ava root, came on board without the least ceremony. Having got into Van Diemen's Road, we anchored in 18 fathoms water, little more than a cable's length from the breakers; and our coasting anchor, to keep the ship from tailing on the rocks, lay in 47 fathoms water. By this time we were surrounded with people, and our seamen were so eager in purchasing their curiosities, even at the expence of cloaths, that Capt. Cook found it absolutely necessary to prohibit any farther commerce of this sort. The good effect of this order, was, that on the 4th, the natives brought us fowls, pigs, bananoes, and cocoa-nuts in abundance, for which we exchanged small nails and pieces of cloth, even old rags would purchase pigs and fowls. A trading party was now settled, and our commanders went on shore, attended by Mr. Forster and other officers, in company with a chief named Attago, who had attached himself to Capt. Cook, the first moment of his coming aboard, which was before the ships came to anchor. This person of some note presented the captain with several articles, and as a greater testimony of friendship exchanged names with him; a custom, which, as we have observed, is practised at Otaheite, and the Society Isles. We were received on shore with the same demonstrations of joy as at Middleburg, and the gentlemen set out into the country, except the two commanders, who distributed presents to such of the natives as Attago pointed out, who were afterwards discovered to be of superior rank to himself; though at this time, by the attention paid

to him, he appeared to be the principal person. Having complained of the heat, Attago shewed and seated us under the shade of a large tree; and the people, who were ordered to form a circle, never attempted to pass the prescribed bounds, and crowd upon us, as did those of Otaheite. After having been here some time, we hinted our desire to see the country; whereupon Attago immediately conducted us along a lane that terminated in an open green, on one side of which we saw a place of worship, built on a mount about eighteen feet high. It was an oblong square, inclosed by a stone parapet wall, about three feet in height; from which the mount, covered with green turf, rose to the building with a gradual slope. The building was twenty by fourteen feet. When we had advanced within fifty yards of its front, every one sat down on the green. Three elderly men, whom we took for priests, begun a prayer, having their faces to the house, which lasted about ten minutes, and this being ended, they came and seated themselves by us. We made them presents of what we had about us, and then proceeded to view the premises, to which they did not shew the least reluctance. The house was built in every respect like their common dwellings, with posts and rafters, covered with palm thatch. The eaves came down within three feet of the ground, and the open space was filled up with strong matting made of palm-leaves as a wall. In the front, leading to the top of this, were two stone steps; and round the house was a gravel walk: the floor also was laid with fine gravel, in the center whereof was an oblong square of blue pebbles, raised six inches higher. In one angle of the building stood an image roughly carved in wood, and another lay on one side. This image was turned over and over by Attago, as he would have done any other log of wood, which convinced us, that they were not considered by the natives as objects of worship. We put several questions to Attago concerning this matter, but did not understand his answers; for our readers are to be informed, that, at our first arrival, we hardly could understand a word the people said. We thought it necessary to leave an offering, and therefore laid down upon the platform some medals, nails, and other things, which our friend immediately took up and put in his pocket. We could not conceive how they could cut such large stones out of the coral rocks, with which the walls were made that inclosed the mount, some of them being ten feet by four, and near six inches thick. The mount, which stood in a kind of grove, was open only to view on that side which fronted the green, and here five roads met, most of which appeared to be public. Among the various trees that composed the groves, we found the Etoa tree, of which are made clubs, and a sort of low palm, very common in the northern parts of Holland. This place of worship, in the language of Amsterdam, is called A-fia-tou-ca.

On our return to the water side, we turned off to a road leading into the country, about sixteen feet broad, and as level as a bowling-green, several other roads intersected it, all inclosed on each side with neat reed-fences, and shaded by fruit-trees. The country hereabouts is surprisingly fertile, inasmuch, that we might easily have imagined ourselves in the most pleasant situation that Europe could afford. Here are various delightful walks, and not an inch of uncultivated ground. Nature assisted by art no where appears to more advantage than in this fertile spot. The roads, even the high public one, which was about sixteen feet broad, occupied no more space than was absolutely necessary, nor did the boundaries and fences take up above four inches each, and in many places of these were planted useful trees and plants. On every side you saw the same appearances; nor did change of place alter the scene. In this transporting place we met great numbers of people going to the ships laden with fruit, and coming from them; all of whom gave us the road, by either turning to the right or left hand, sitting down, or passing still with their backs to the fences, till we had passed by them. In many of the cross roads, were

No. 16.

A-fia-tou-cas, whose mounts were surrounded with pallisadoes. After having walked several miles, we came to a more spacious one, near to which was a large house, the property of an old chief, who was one of our company. Here we were regaled with fruit; but our stay was short, and our guides having conducted us down to our boat, we returned with Attago to our ship to dinner. When aboard an old man was ushered into the cabin: we placed him at table, and soon perceived he was a man of consequence, for Attago, the chief being almost blind, eat with his back towards him; and as soon as the old man returned ashore, which was after he had tasted the fish, and drank two glasses of wine, Attago took his place at the table, finished his dinner, and drank also two glasses of wine. After dinner we all went ashore again. We found the old chief, who, in return for his slender meal, presented us with a hog. Before we set out for the country, Capt. Cook went down with Attago to the landing-place, where he found Mr. Wales laughing at his perplexing situation. The boats that brought us ashore not having been able to get close in with the landing-place, Mr. Wales had pulled off his shoes and stockings to walk through the water, and, when on dry ground, sitting down, he put them between his legs, in order to put them on, when in an instant they were snatched away by a person behind him, who immediately mixed with the crowd. The man he could not follow bare-footed over the sharp coral rocks; the boat was put back to the ship, all his companions had made their way through the crowd; and he was found by the captain in this forlorn condition: but the friendly Attago soon set him at liberty, by finding out the thief, and recovering the shoes and stockings. We now began our excursion into the country. Having passed the first-mentioned Apiatouca, the old chief shewed us a pool of fresh water, though we had not made the least enquiry for any. It is very probable this is the bathing place for the king and his nobles, mentioned by Talfman. From hence we were conducted down to the shore of Maria Bay, or N. E. side of the isle, where we were shewn a boat-house, in which was a large double canoe not yet launched. The old chief did not fail to make us sensible that it belonged to him. Night now approaching, Attago attended us to the boat, and we returned aboard. As to the botanizing and shooting parties, that were out with us the same day, they were all civilly treated, and well entertained by the natives. The party also at the market on shore had a brisk trade, and many advantageous bargains. They procured plenty of bananas, yams, cocoa-nuts, pigs, and fowls, for nails and pieces of cloth. A boat from each ship was employed to bring off their cargoes, by which means we obtained cheaper, and with less trouble a good quantity of refreshments from those of the natives who had no canoes to carry their commodities off to the ships.

On Tuesday the 5th, early in the morning, the captain's friend, Attago, brought him a hog and some fruit, for which, in return, he received a hatchet, a sheet, and some red cloth. The pinnace having been sent on shore to trade, as usual, soon returned, and we were informed that the natives, in many respects, were exceeding troublesome. The day before they had stole the boat's grapling, and at this time they were for taking every thing out of the pinnace. It was therefore judged necessary to have on shore a guard, and accordingly the marines were sent, under the command of Lieutenant Edgcombe. These were soon after followed by the two commanders, Attago, and several of the gentlemen. On landing, the old chief presented Capt. Cook with a pig; and then Mr. Hodges, accompanied by the two captains, took a walk into the country, in order to make drawings; after which, they all returned with Attago, and two other chiefs on board to dinner, one of which last had sent a hog on board the Adventure, some hours before, for Capt. Furneaux, without requiring any return; a singular instance of generosity this: but Attago did not omit to put Capt. Cook in mind of the pig the old king gave him in the

2 N

morn.

morning, for which he had in return, a chequed shirt, and a piece of red cloth. He desired to put them on, which when done, he went upon deck, and shewed himself to all his countrymen. He had done the same with the sheet the captain gave him in the morning; but when we went on shore in the evening, the old chief took to himself every thing Attago and others had got in their possession. This day the different trading parties procured for both ships a good supply of refreshments; the sailors therefore had leave to purchase any curiosities they might fancy; which opportunity they embraced with great eagerness; indeed they became quite the ridicule of the natives from their thirst after trifles, who jeeringly offered them sticks and stones, in exchange for other things; and one waggish boy took a piece of human excrement on the end of a stick, and offered it for sale to every one he met. This day a fellow found means to get into the master's cabin, and stole some books and other articles, with which he was making off in his canoe. On being pursued by one of our boats, he left the canoe, and took to the water; but as often as our people attempted to lay hold of him, he dived under the boat, and at last, having unshipped the rudder, got clear off. Other daring thefts were committed at the landing-place. One man stole a seaman's jacket, and would not part with it till pursued and fired at.

Wednesday the 6th our friend Attago visited us again as usual, brought with him a hog, and assisted us in purchasing many more. We went afterwards on shore, visited the old chief, with whom we stayed till noon, and then returned on board to dinner, accompanied by Attago, who never one day left Capt. Cook. Being about to depart from this island, a present was made for the old king, and carried on shore in the evening. When the captain landed, he was informed by some of the officers, that a far greater man than any we had yet seen, was come to pay us a visit. Mr. Pickersgill said, he had seen him in the country, and believed he was a man of great consequence, by the extraordinary respect paid him by all ranks of people; some of whom, when they approached him, fell on their faces, and put their head between their feet; nor do any pass him without permission. Upon his arrival, Mr. Pickersgill and another gentleman took hold of his arms, and escorted him down to the landing-place, where we found him seated with such an affected gravity, that we really thought him an idiot, whom, from some superstitious notions, the people were ready to adore. When Capt. Cook saluted and addressed him, he neither answered, nor took the least notice of him. And as there appeared in the features of his countenance not any alteration, the captain was about to leave him to his private cogitations; but an intelligent youth cleared up all our doubts, and from his information, we were now fully convinced, that what we took for a stupid fool was the principal head man, or king of the island. Therefore the present, intended for the old chief, was presented to him. It consisted of a shirt, an axe, a piece of red cloth, a looking glass, some nails, medals, and beads; all of which were put upon, or laid down by his majesty, without his speaking one word, or turning his head either to the right or left. We departed from this living statue, and had not been long on board, before he sent us a present of provisions, consisting of about twenty baskets of roasted bananas, four bread and yams, and a roasted pig, weighing about twenty pounds. We now no longer questioned the real dignity of this fullen chief. When these things were brought down to the water side, Mr. Edgecumbe and his party were coming off to the vessels, and the bearers of the present said it was from the Areeke, (that is king) of the island, to the Areeke of the ship.

On Thursday the 7th of October, early in the morning, our two commanders, accompanied by Mr. Forster, went ashore, to make a return to the Areeke of the island for his last night's present. They soon found Attago, of whom we learnt, that his majesty's name was Ko-haghee-too-Fallangou. After some little time he appeared with a very few attendants. By Attago's

desire we all sat down under a tree, and the king seated himself on a rising ground, about twelve yards from us. We continued some minutes facing each other, expecting Attago would introduce us to his majesty; but observing no signs of this, the two captains went, and having saluted the king sat down by him. They then put on him a white shirt, and laid down before him a few yards of red cloth, a brass kettle, a saw, two large spikes, three looking glasses, twelve medals, and some strings of beads. All this time he behaved in the manner before related, sitting like a statue; his arms seemed immoveable; he spoke not one word, nor did he seem to know what we were about. When we gave him to understand by signs and words, that we should soon depart from his island, he made not the least reply; but when we had took leave, we perceived he conversed with Attago, and an old woman; and in the course of this conversation he laughed heartily in spite of his assumed gravity; for it could not be his real disposition, seeing he was in the prime of life, and these islanders, like all others we had lately been acquainted with, are much given to levity. We were now introduced by Attago into another circle of respectable old people of both sexes, among whom were our friend, the aged chief, and the priest, who was generally in his company. We concluded, that the juice of pepper-root, had the same effect that strong liquors have on Europeans, when they drink too much of them; for we observed, that the reverend father could walk very well in the morning, but in the evening was generally led home by two friendly supporters. We were a little at a loss how to take leave of the old chief, having, we feared, almost exhausted all our choicest store on the king; but having examined our pockets, and Capt. Cook's treasury bag, which he always carried with him, we collected together a tolerable good present both for the chief and his friends. This old chief had a natural air of dignity, which the king had not. He was grave, but not sullen; would talk at times in a jocular manner, and when conversing only on indifferent subjects, would endeavour to understand us, and be understood himself. The priest in all our visits would repeat a short prayer, which none in the company attended to, and which for our parts we did not understand. Having continued a social conversation with these friends near two hours, we bid them farewell, and repaired to our ship with Attago, and a few of his friends, who after breakfast were dismissed loaded with presents. Attago very strongly importuned us to call again at this isle on our return, and requested of the captain, more than once, to bring him a suit of clothes like those he then had on, which was his uniform. This friendly islander, during our stay, was, on several occasions, very serviceable to us. He daily came on board in the morning, soon after dawn, and frequently stayed with us till the evening. When on board or on shore, he performed every kind office for us in his power, the expence for his services was trifling, and we thought him a very valuable friend.

The supplies which we procured from this island were about one hundred and fifty pigs, double that number of fowls; as many bananas, &c. as we could find room for, and, had we continued longer, we might have had more than our wants required. We were now about to depart, when, in heaving the coasting cable, it broke, by being chafed by the rocks; by which accident we lost nearly half the cable, together with the anchor, which lay in forty fathoms water, without any buoy to it; from whence a judgment may be formed of this anchorage. At ten o'clock P. M. we got under sail, but our decks being encumbered with fruit, fowls, &c. we kept plying under the land till they were cleared. Before we continue the history of this voyage, we shall here give a particular account of this island, and its neighbouring one of Middleburgh, a description of which we doubt not will afford an agreeable entertainment to our readers, and very numerous subscribers, who have favoured this work with a generous encouragement, equal to our most sanguine expectations and wishes.

These

MAN of EASTER ISLAND.

WOMAN of EASTER ISLAND.

55

These two islands were first discovered by Capt. Abel Jansen Tasman, a Dutchman, in January 1642-3, which he named Amsterdam and Middleburgh. The former is called by the natives Tonga-ta-bu, and the latter Ea-oo-wee. From observations made on the spot, they are found to be situated between the latitude of 21 deg. 29 min. and 21 deg. 3 min. S. and between the longitude of 174 deg. 40 min. and 175 deg. 15 min. W. Middleburgh, the southermost isle, is about 10 leagues in circumference, and from its height may be seen 12 leagues at sea. It is bounded by plantations, especially on the S. W. and N. W. sides; but the interior parts are not so well cultivated; yet even this neglect gives an additional beauty to the whole island; for here we see dispersed, forming an agreeable variety, groves of cocoa-nut and other trees, lawns clothed with thick grass, with plantations, roads and paths in every direction, making a charming confusion, as greatly improves and enlivens the prospect.

The island of Tongatabu, or Amsterdam, is shaped something like an isosceles triangle, the longest legs of which are seven leagues each, and the shortest four. It lies nearly in the direction of E. S. E. and W. N. W. much of an equal height, but rather low, being not more than 80 feet above the level of the sea. Both this isle, and that of Middleburgh, are guarded by a reef of coral rocks, on which the force of the sea is spent before it reaches the shore. Van Diemen's Road, wherein we anchored, is under the N. W. part of the island, having a reef of rocks without it, over which the sea breaks continually. The extent of the bank is not more than three cables length from the shore; without that is an unfathomable depth; and, as we have before observed, the loss of an anchor, and the damage our cables sustained, are plain indications that the bottom is none of the best. This island is wholly laid out in plantations, abounding with the richest productions of nature, as bread-fruit, plantains, sugar-cane, and a fruit like a nectarine, called Fighega, and at Otaheite Ahuya: in short, here are to be found most of the articles, productions of the Society Islands, besides others which they have not. The same may be said of vegetables, the stock of which we increased by an additional assortment of garden seeds, &c. The produce and cultivation of Middleburgh is much the same as at Amsterdam, only a part of the former is cultivated. The lanes and roads are laid out in so judicious a manner, as to open a free communication from one part of the island to the other. We here saw no towns or villages, most of the houses being situated in the plantations: they are neatly constructed, but in their dimensions do not exceed those in the other islands. The only difference seems to consist in the disposition of the framing. They have small areas before most of them, planted round with trees, or shrubs, whose fragrance perfumes the very air. The whole of their furniture is composed of a few wooden platters, cocoa-nut shells, and some neat wooden pillows shaped like stools or forms. Their common cloathing serves them for bedding, with the addition of a mat. We saw two or three earthen vessels among them; one in the shape of a bomb-shell, with two holes in it, opposite each other; the others resembled pipkins, containing about five or six pints. Having seen no great number of these utensils, we concluded they were the manufacture of some other isle. The only domestic animals we saw among them were hogs and fowls. The latter are as large as any in Europe, and their flesh equally good, if not better. We believe they have no dogs, as they were very desirous of those we had on board. In these isles are no rats, nor did we discover any wild quadrupeds, except small lizards. The land birds are pigeons, turtle-doves, parrots, paroquets, owls, baldcoots with a blue plumage, small birds, and large bats in abundance. The same sorts of fish are found here as in the other isles. Their fishing-tackle is much the same; as hooks made of mother of pearl, gigs having two or three prongs, and nets composed of a very fine thread, with the meshes made exactly like ours. The construction of their canoes is remarkably

ingenious, exceeding in point of workmanship, every thing of this kind we saw in this sea. They are formed of several pieces sewed together, in so neat a manner, that on the outside it is difficult to discern the joints. On the inside, all the fastenings pass through ridges. They are of two sorts, namely, double and single; the single ones are from 20 to 30 feet in length, and about 20 or 22 inches broad in the middle.

The stern terminates in a point, and the head is somewhat like the extremity of a wedge. At each end is a kind of deck, open in the middle, for about one third part of the whole length. The middle of their decks in some of them, is ornamented with white shells, stuck on little pegs, and placed in rows. They work these single canoes sometimes with sails, but oftner with paddles, the short blades whereof are broadest in the middle: they have all out-riggers. The double canoes are made with two vessels about 60 or 70 feet long, and 4 or 5 broad in the middle. Each end terminates in a point, and the hull differs but little in its construction from the single canoe, being put together exactly in the same manner; but they have a rising in the middle round the open part, somewhat like a trough which is made of boards, well compacted and secured to the body of the vessel. Two such vessels as above mentioned are placed parallel to each other, and fastened by strong cross beams, secured by bandages to the upper part of the risings. The vessels are about six feet asunder. Over these beams, and others, supported by staunchions fixed on the bodies of the canoes, is laid a boarded platform, whereon steps a mast that may easily be raised or let down. All parts of the double canoes are strong, yet as light as the nature of the work will admit; and they may be immersed in the water to the very platforms, without being in the least danger of filling; and so long as they hold together, it is scarce possible, under any circumstance whatever, to sink them. By the nature of their construction, they are not only vessels of burden, but fit for short voyages from one island to another, and are navigated with a latteen-sail, or triangular one, extended by a long yard, a little curved or bent. Their sails are composed of mats, and their ropes like ours, some four or five inches. A little shed is raised upon the platform, for to screen the crew from the sun, and for other purposes. Here they have a moveable fire-hearth, which is a square shallow wooden trough, filled with stones. From off the platform is the way into the hold, wherein they stand to bail out the water. Capt. Cook was of opinion, that these double canoes are navigated either end foremost, and that in changing tacks, the sail is only shifted, or gibbed; but we cannot speak with certainty of this matter, not having seen any of them under sail, or with the mast and sail an end, but what were at a great distance from us.

The only piece of iron we saw among these people was a small awl, which had been made of a nail; all their working tools are of stone, bone, shells, &c. as at the other islands. Every one who sees the work executed with these tools, cannot but be struck with admiration at both the ingenuity and patience of the artificers. They had little knowledge of the utility of iron, but enough to prefer nails to beads, and such trifles. Shirts, cloth, jackets, and even rags, were more esteemed by them than the best edged tool, on which account we parted with few axes but what were given as presents; however, if we include the nails exchanged for curiosities, by the companies of both ships, with those given for refreshments, &c. they could not get from us less than 500 weight, great and small.

As to the natives of these islands, both sexes are of a common size with Europeans; but with respect to complexion, their colour is that of a lightish copper, and more uniformly so than among those of Otaheite and the Society Isles. Of our gentlemen, some thought these people were a much handsomer race; others were of a contrary opinion, of which number Capt. Cook was one. It is certain, that they have in general regular features, with a good shape: they are also active, brisk,

and lively. The women are especially very merry and sociable, and would chat with us, without being invited, or if we seemed attentive, without considering whether we understood them or not. They appeared in general to be modest: yet instances of those of a different character were not wanting; and having some venereal complaints, Capt. Cook took all possible care, that the disorder should not be communicated to them. Whenever opportunity served, they discovered a strong propensity to pilfering, and in the art of thieving are full as knowing and dexterous as the Otaheiteans. Their hair, particularly of the females, is black, but some of the men have a method of staining their hair with various colours, as white, red, and blue, which we saw upon the same head. It is wore cut short, and we met with only two exceptions to this custom. The boys have only a single lock on the top of the head, combed upwards, and a small quantity on each side. The beards of the men are shaved quite close with two shells; and even those of an advanced age have fine eyes, and in general good teeth. They are tattooed from the middle of the thigh to above the hips; but among the women, the skin is punctured very slightly, and that only on their arms and fingers. Their dress consists of a piece of cloth or matting, hanging below the knees, but from the waist upwards they are generally naked. Their ornaments are bracelets, amulets, and necklaces, composed of bones, shells, and beads, of mother of pearl. The women have a curious apron made of the outward fibres of the cocoa-nut shell: small pieces of this stuff are sewed together in such a manner as to form stars, half moons, and squares, &c. and the whole is studded, and decorated with red feathers, so as to have a pleasing effect. They wear also rings on their fingers made of tortoiseshell, and pendants of the same, about the size of a small quill; but though all have their ears bored, yet these last kind of ornaments are not worn in common. The natives of these islands make the same sorts of cloth, as the inhabitants of Otaheite; but they have not such a variety, nor any of so fine materials; yet having a method of glazing their cloth, it is more durable than that at Otaheite, and will resist rain for some time. Their matting is of various kinds; some very fine, and generally used for cloathing; another sort is thick and stronger, which serves them for sails, and to sleep on. The colours of their cloth are black, brown, purple, yellow, and red; all extracted from vegetables. They make many little toys, which sufficiently evinces their ingenuity: and among their utensils are various sorts of curious baskets, some made of the same materials as their mats, and others of the twisted fibres of cocoa-nuts; which prove in the workmanship, that these people want neither taste to design, nor skill to execute. How they amuse themselves in their leisure hours, we cannot particularly and positively say, being but little acquainted with their diversions. We were entertained frequently with songs from the women, in an agreeable stile, and the music they accompanied by snapping their fingers, so as to keep time to it. Both this and their voices are very harmonious; and they have a considerable compass in their notes. Among their musical instruments, which came under our knowledge, they have a drum, or rather an hollow log of wood, on the side of which they beat with two drum sticks, whereby is produced a doleful sound, not quite so musical as that of an empty cask. We saw one of these drums five feet and a half long, and thirty inches in girth. It had a slit in it from one end to the other, about three inches wide, by means of which it had been hollowed out. They have also two musical pipes; one a large flute made of a piece of bamboo, which they fill with breathing through their noses: these have four stops, whereas those at Otaheite have only two. The other instrument is composed of 10 or 11 small reeds of unequal lengths, bound together side by side, as the Doric pipe of the ancients is said to have been. The open ends of the reeds into which they blow with their mouths are of equal height or in a line.

In this country the manner of a salutation is by

joining or touching noses, and the displaying a white flag or flags, when strangers arrive, is a sure sign of peace. Such were displayed when we first drew near the shore; but the people who then came on board, brought with them some pepper plant, which they sent before them into the ship; and a stronger sign of friendship we could not wish for. From the friendly reception we experienced, and the unsuspicious manner of their behaviour upon our landing, we concluded, they are seldom molested either by foreign or domestic enemies; nevertheless they are not without very formidable offensive and defensive weapons, as bows and arrows; also clubs and spears formed of hard wood. The clubs are of various shapes, and from three to five feet in length. The bows and arrows are none of the best, the former being very slight, and the latter only a slender reed pointed with hard wood. On the inside of the bow is a groove, wherein is placed the arrow. Several of their spears have many barbs, and must be dangerous weapons where they take effect. Another singular custom is that of putting every thing you give them to their heads, by way of thanks, as we imagined; and where things were given to young infants, the mother lifted up the child's head to its head, so that this manner of paying a compliment is taught them from their very infancy. The same custom they also used in their exchanges with us. It is called by the natives *sagafatie*, and has, we believe, various significations, according as it is applied; all however complimentary. A still more singular custom prevails among them, though not peculiar to the inhabitants of the Friendly Isles. The greater part of both sexes had lost one or both of their little fingers; and, except some young children, we found few who had both hands perfect; but the reason of this mutilation we could not learn. They also burn or make incisions in their cheeks, near the cheek bone: the reason of which was equally unknown to us. However, such is the goodness of the climate, that we observed neither sick nor lame among them; all appeared healthy, strong and vigorous.

The government of this country is much like that of Otaheite, that is, in a king or prime chief (called *Areeke*) with other subordinate chiefs, who are lords of certain districts, perhaps sole proprietors, to whom the people seem to pay great obedience. We also perceived a third rank, one of whom was our friend *Atago*, who seemed to have not a little influence over the common people. It was the opinion of Capt. Cook, that all the land on *Tongatabu* is private property, and that here, as at Otaheite, are a set of servants, or slaves, who have no property in land. Indeed, we cannot suppose every thing to be in common, in a country so richly cultivated. Few would toil if they did not expect to reap, and enjoy the fruits of their labour as their own. Parties of six, eight, or ten people, would frequently bring fruit down to the landing place; but we always saw one man, or woman, superintend the sale of the whole, without whose consent no exchanges could be made; and the things they bartered for were always given them, all which plainly shews they were the owners, and the others only their servants.

Though the benevolent author of nature has poured forth liberally his bounties on these isles; yet the high state of cultivation their lands are in, must have cost them indefatigable pains and labour: but this is now amply rewarded by the great produce every where to be seen, and of which all partake; for no one wants the common necessities of life: the poor are not crying for bread; but joy, contentment, and cheerful mirth are painted in the features of every one. An easy freedom prevails among all ranks of people; they have few desires they cannot gratify, and they are blessed with a climate wherein the disagreeable extremes of heat and cold are equally unknown. The article of water was the only one of which they may be said to have a scanty supply; this they are obliged to dig for. We saw not any at *Amsterdam*, and but one well. At *Middleburgh* we found no water but what the natives had in vessels; this was sweet and cool, and probably procured not far from the spots where we saw it.

We can say very little of the religion of these people. The Afiatoucas may be appropriated to this purpose; but some of our gentlemen thought these buildings were only burying places. It is certain particular persons made speeches in them, which we understood to be prayers; perhaps, they may be both temples and burying places, as at Otaheite; but with respect to the images being idols, we had many reasons to be of a contrary opinion. Mr. Wales told us, that one of these images was set up

for him and others to shoot at; not very respectful this to divinity; and yet we have seen the Portuguese, when their wishes were not gratified, treat their tutelary saints with much greater familiarity. It appeared however very plain to us, that these Afiatoucas are much frequented for one purpose or other; for the areas before them were covered with green sod, and the grass was very short, by being often fat upon and much trodden, which doubtless prevented its growth.

C H A P. IV.

The Resolution and Adventure continue their voyage from Amsterdam—proceed for Queen Charlotte's Sound—An interview with the inhabitants—The final separation of the two ships—Transactions and incidents in Charlotte's Sound—The inhabitants discovered to be Cannibals—A description of the coast—The Resolution departs from the Sound, and proceeds in search after her consort—Course of the Resolution in search of the supposed continent; and the methods pursued to explore the Southern Pacific Ocean—Arrives at Easter Island—Transactions there—An expedition into the inland part of the country, with an account of some gigantic statues, and description of the whole island.

ON Thursday, the 7th of October, we made sail to the southward, and our route determined was, to make for Queen Charlotte's Sound in New Zealand, there to take in a supply of wood and water, and then to proceed on farther discoveries to the S. and E. On the 8th, we made the island of Pilsart, distant eight leagues, and bearing S. W. by W. half W. This was also discovered by Tasman, and lies in latitude 22 deg. 26 min. S. and in 175 deg. 59 min. W. longitude, distant 32 leagues from the south end of Middleburg, in the direction of S. 52 deg. W. Two remarkable hills rise therein of a considerable height, and seemingly disjoined from each other by a low valley. We now, after a few hours calm, stretched with a S. W. wind to the S. E. but, on Sunday, the 10th, it veered round to the S. E. and E. S. E. upon which we resumed our course to the S. S. W.

On Thursday the 21st at five o'clock, A. M. we made the land of New Zealand, extending from N. W. by N. to W. S. W. We now stood in shore till we were abreast of Table Cape and Portland Island, which is joined to it by a ledge of rocks; we were gazed at by the natives as we passed; but none of them ventured to come off in their canoes. We advanced to the Black Cape on the twenty-second, and now several inhabitants took courage and boarded us, among whom was a chief; he was clothed elegantly, and his hair was dressed in the high fashion of the country. We entertained him in the cabin, and his companions sold us some fish. These people were very fond of nails, and the chief received them with much greater eagerness than when the captain gave him hogs, fowls, seeds, and roots. We obtained from him a promise not to kill any, and if he keeps his word, there are enough to stock the whole island; the present consisted of two fows, two boars, four hens, and two cocks; we likewise gave him several useful seeds, and instructed him in the manner of setting them. These people very well remembered the Endeavour having been on their coast. The Adventure was now a good way to leeward, and as we were obliged to tack, she was consequently separated from us; but we were joined by her on the twenty-fourth. The wind was now very high, so that we could carry hardly any sail; we endeavoured to make Cape Palliser, the northern point of Eakeinomaue, but we had such a hard gale for two days, that drove us off the land just as we were in sight of port. This was very mortifying; but two favourable circumstances attended it, for we were in no danger of a lee-shore, and it was fair over head. In the evening of the twenty-fifth we endeavoured to find the Adventure, which the storm had separated, but without effect, the weather being so hazy, that we could not see a mile round us. On the twenty-eighth we saw the Adventure about five miles to leeward, and we kept company with her till the night of the twenty-ninth, when she disappeared, nor did we see her at day-light. Charlotte

No. 17.

Sound was the appointed place of rendezvous; and as we had separated from the Adventure, we were obliged to make for it, otherwise Capt. Cook would have sought a supply of wood and water further south. We stood to the eastward, in hopes of meeting with the Adventure. On the second of November the morning was very clear, and we kept a sharp look-out for the Adventure; but as we could not see her, we judged she was got into the Sound. We accordingly made for the shore of Eakeinomaue. In doing which we discovered an inlet, which the captain had never observed before, on the east side of Cape Teerewhitte. We anchored in twelve fathoms water, at the entrance of this inlet; and several of the inhabitants came on board, who were extravagantly fond of nails. We ran up into Ship Cove on the third of November, where we expected to see the Adventure, but were disappointed. Here we were obliged to unbend the sails, which had been very much damaged in the late storms. Several people came on board, who remembered the Endeavour when on this coast, particularly an old man called Goubiah. The empty casks were ordered on shore, and the necessary repairs both to them and the ships were ordered to be made. We were unsuccessful in our fishing parties, who caught no fish, but were well supplied by the natives with that useful article. On opening the bread casks, we found a great deal of it damaged; that which remained good we baked over again, in order to preserve it.

On Friday the fifth, one of the natives took an opportunity of stealing one of the seamen's bag of cloaths, which, with some difficulty, we recovered. This made our people more cautious in future. We found one of the fows which Capt. Furneaux had put on shore, and were informed that the boar and other sow were taken to another part, but not killed. We were mortified very much when we heard that old Goubiah had killed the two goats which Captain Cook put on shore, and were concerned to think that our endeavours to stock this country with useful animals were likely to be rendered fruitless, by those very people for whose benefit they were designed. But nature had amazingly assisted our intentions in the gardens, where every thing was in a flourishing state, except the potatoes, which were most of them dug up. We put on shore another boar and sow, with two cocks, and four hens. We purchased a large quantity of fish from the natives, who were very much inclined to theft; we detected them picking our pockets very frequently. Several strangers came to visit us in five canoes, they took up their quarters in a cave near us, and decamped the next morning with six of our small water casks. All the people whom we found on our arrival likewise went with them. Some of them returned in a day or two, and supplied us with fish.

On Monday, the fifteenth, we made a party to the summit of one of the hills, in order to look for the

2 O

Adven-

Adventure, but were disappointed, and totally at a loss to know what was become of her. When we returned, the natives were collected round our boat, to whom we made some presents, and went on board. We were very well supplied with fish during our stay here. On the twenty-second we took one boar and three fows, together with some cocks and hens, into the woods, where we left them with provision sufficient for ten or twelve days, with hopes that the natives would not discover them till they had bred. Our officers having visited the dwelling-places of several of the natives, found some human bones, from which the flesh appeared to be lately taken; and on the twenty-third, they being on shore, saw the head and bowels of a youth, lately killed, lying on the beach; his heart was stuck on a fork, and fixed at the fore part of one of the largest canoes. The head was bought, and brought on board, where one of the natives broiled and eat it before the whole ship's company, and the sight made several of them sick. Oedidee, whom we had brought with us, expressed his horror at this transaction in terms which it is impossible for us to describe. It is certain that the New Zealanders are cannibals, which this circumstance fully proves; but from all we could learn, they only eat the flesh of those slain in battle. This youth had fallen in a skirmish with some of the natives, as well as several others; but how many, or what was the cause of the quarrel, we could not learn.

Our crew had for 3 months past lived almost wholly on fresh provisions and vegetables, and we had, at this time, neither a scorbutic nor sick person on board. Before we quitted the Sound, we left a memorandum, setting forth the day of our departure, what course we intended steering, &c. and buried it in a bottle, where it must be discovered, should Capt. Furneaux touch here, though we did not place any great expectation in such an event. We sailed from hence on the twenty-fifth of November, and fought the Adventure in several harbours, but without effect. All hopes of seeing her again were now vanished, and we set about our intended discoveries by ourselves. The ship's company were perfectly satisfied with Capt. Cook's care and conduct, and did not express any uneasiness at our being unattended.

On Friday, the twenty-sixth, we steered to the south, and on Monday the sixth of December found ourselves antipodes to our London friends. We were then in S. latitude 50 deg. 17 min. and E. longitude 179 deg. 40 min. We met with several flights of our old companions, albatrosses, petrels, &c. We sailed through large quantities of loose ice on the fourteenth of November, and discovered many ice islands. We were soon embayed by the ice, and were obliged to stretch to the N. W. We were now in much danger, owing to the ice islands and the fog. We attempted to take some of the ice on board, but without effect; but on the seventeenth we succeeded, and got on board as much as we could manage.

Tuesday, the twenty-first, we came the second time within the antarctic circle; and on a sudden got among a great quantity of loose ice, and a cluster of ice islands, which it was very difficult to steer clear of, as the fog was very thick. On the twenty-fourth they increased so fast upon us, that we could see near an hundred round us, besides an astonishing quantity of small pieces. Here we spent the twenty-fifth, being Christmas-day, in much the same manner as we did the preceding one.

On the second of January, we steered A. D. 1774. N. W. in order to explore great part of the sea between us and our track to the south; but were obliged to steer north-easterly the next day, and could not accomplish our design. Many of the people were attacked with slight fevers while we were in these high latitudes, but happily they were cured in a few days. Taking every circumstance into consideration, it is not very probable that there is any extensive land in our track from Otaheite, which was about two hundred leagues; and that any lay to the west is still less probable; we therefore steered N. E. There was no sign

of land; and therefore on the eleventh we altered our course, and steered S. E. On the twenty-fifth we found ourselves in a pleasant climate, and no ice in view; on the twenty-sixth came a third time within the antarctic circle. On Sunday, the thirtieth, we saw a very extensive field of ice, and within the field we distinctly enumerated ninety-seven ice hills of various sizes; it is probable that such mountains of ice were never seen in the Greenland seas. On this account, the attempt to get farther to the south, though not absolutely impossible, was yet both rash and dangerous. The majority of us were of opinion that this ice extended to the pole, as it might possibly join some land to which it has been contiguous since the earliest times. Should there be land to the south behind this ice, it certainly can afford no better retreat for man, beast, or birds, than the ice itself, with which it must certainly be covered. As we could not go any farther to the south, we thought it advisable to tack, and stand back to the north, being at this time in the lat. 71 deg. 10 min. S. and 106. deg. 54 min. W. Happily for us we tacked in good time; for we had no sooner done it, than a very thick fog came on; which would have been highly dangerous when we fell in with the ice.

On the first of February we were able to take in some more ice, which, though it was cold work to collect, served us for present consumption when melted. Capt. Cook was now well satisfied that no continent was to be found in this ocean, but that which is totally inaccessible; he therefore determined to pass the ensuing winter within the tropic, if he met with no other object worth pursuing. It was determined to steer for the land discovered by Juan Fernandez, or, in failure of this pursuit, to search for Easter Island or Davis's Land, which we knew very little about. The sailors, and all on board acceded to these designs, and were happy at the thoughts of getting into a warmer climate. We had continual gales from the eighth to the twelfth instant, when it fell a dead calm. The weather varied every day considerably till the twenty-fifth, when Capt. Cook was persuaded that the discovery of Juan Fernandez, if any such was ever made, could be nothing but a small island, not worth notice. On the twenty-fifth, Capt. Cook was taken so ill as to be obliged to keep his bed, and recovered very slowly. It is something very extraordinary, that when he could eat nothing else he had a mind to a dog of Mr. Forster's, which was killed, and he relished both the flesh and the broth made of it. This seems very odd kind of food for a sick man; and, in the opinion of many people, would create much greater sickness than it was likely to be any means of removing.

On the 11th of March land was seen from the mast-head, which proved to be Easter Island: and on the 13th, we came to an anchor in 36 fathoms water, before the sandy beach. One of the natives came on board the ship, where he staid two nights. He measured the length of the ship, and called the number by the same names as the Otaheiteans do; but otherwise we could not understand his language. A party of us went ashore on the 14th, and found a great number of the natives assembled, who were pacifically inclined, and seemed desirous to see us. We made signs for something to eat, after we had distributed some trinkets among them; they brought us some sugar-canes, potatoes, and plantains. We very soon found out that these gentlemen were as expert thieves as any before met with; we could scarce keep any thing in our pockets, and it was with some difficulty that we could keep our hats upon our heads. These people seemed to understand the use of a musket, and to be very much afraid of it. Here were several plantations of potatoes, sugar-canes, and plantains; but otherwise the country appeared barren and without wood. We found a well of brackish water, and saw some fowls. As the natives did not seem unwilling to part with these articles, and as we were in want of them, we determined to stay a few days. A trade was accordingly opened with the natives, and we got on board a few casks of water. A party of officers and men were sent up the country in order

order to examine it; and Capt. Cook remained on shore among the natives. An advantageous trade for potatoes was opened, but soon put a stop to by the owners of the spot from whence they were dug. It seems that they had stolen these potatoes; for they all ran away at his approach. From this circumstance it is pretty evident that they are not more strictly honest amongst themselves than to strangers. This reconnoitring party were followed by a crowd of natives; and before they had proceeded far, they were met by a middle-aged man, with his face painted. He had a spear in his hand, and walked along with him, keeping his countrymen at a distance, that our people might receive no molestation from them. This man was punctured from head to foot. They found the greatest part of the island barren; though in many places there were plantations of the roots before mentioned. They met with the ruins of three platforms of stone work. On each of these platforms had stood four very large statues, made of stone, but they were now fallen to the ground, and much defaced. These statues were fifteen feet long, and six feet broad across the shoulders. On the head of each statue was a round red stone, of considerable magnitude. Travelling on, they found in some places a poor sort of iron ore, and afterwards came to a fruitful part of the island, on which were several plantations. They could get no good water in their journey; but they were obliged to drink what they could get, on account of the extremity of their thirst. They found the natives so addicted to theft, that they were obliged to fire some small shot at a man, who took from them their bag of provisions and implement. The shot hit this fellow in the back, on which he dropped the bag and fell; but he soon afterwards got

up and walked off. Some delay was occasioned by this affair. The man before mentioned ran round them and repeated several words, which they could not understand; and afterwards they were very good friends together, no one attempting to steal any thing more. A number of the natives were assembled together on a hill at some distance, with spears in their hands, but dispersed at the desire of their countrymen. There appeared to be a chief among them, which wore a better cloth than the rest. He had a fine open countenance, and was very well made. His face was painted, and his body punctured. They met with some pretty fresh water towards the eastern end of this island, but it was rendered dirty by a custom which the inhabitants have of washing themselves in it as soon as they have drank. Let the company be ever so large, the first that gets to the well jumps into the middle of it, drinks his fill, and washes himself all over; the next does the same, and so on till all of them have drank and washed.

Great numbers of the gigantic statues, before described, are to be seen on this part of the island; one of which they measured, and found it to be twenty-seven feet long, and eight feet broad across the shoulders. One of these figures, of an astonishing height, being standing, it afforded shade for the whole party to dine under, which consisted of thirty persons. Many gained the summit of a hill, but could not see any bay or creek, nor discover any signs of fresh water. They returned to the ship in the evening. No shrubs worth mentioning were found in this excursion, neither did they see an animal of any sort, and but very few birds. They could not discover any thing in the whole island to induce ships, in the utmost distress, to touch at it.

C H A P. V.

The Resolution sails from Easter Island to the Marquesas—Transactions and incidents while she lay in Resolution Bay, in the island of St. Christina—Departs from the Marquesas—These islands described, with an account of the inhabitants, their customs, &c.—The Resolution prepares to leave Otaheite—Another naval review—A description of the island—Her arrival at the island of Huahine—An expedition into the same—Various incidents related—The ship proceeds to Uietea—Her reception there—Incidents during her stay—Character of Oedidee—General observations on the islands.

ON Wednesday, the 16th of March, we took our departure from Easter Isle, and steered for the Marquesas islands, intending to make some stay there if nothing material intervened. On the 6th of April, we discovered an island, when we were in latitude 9 deg. 20 min. and longitude 138 deg. 14 min. we were about nine leagues distance from it. We soon discovered another, more extensive than the former, and presently afterwards a third and a fourth; these were the Marquesas discovered in 1595 by Mendana. After various unsuccessful trials to come to an anchor, we came at last before Mendana's port, and anchored in thirty-four fathoms water, at the entrance of the bay. Several canoes appeared, filled with natives, but it was with some difficulty they were persuaded to come alongside; they were at last induced by some spike nails and a hatchet. From these people we got some fish and fruit. Great numbers of them came along-side next morning, and brought with them one pig, some bread-fruit and plantains, for which they received nails, &c. We often detected them in keeping our goods, and making no return; which practice was not put a stop to till Capt. Cook fired a musket-ball over the head of one man, who had repeatedly served us so. We wanted to get farther into the bay, and accordingly sought after a convenient place to moor the ship in. When Capt. Cook saw there were too many natives on board, he desired that they might be well looked after, or they would certainly commit many thefts. Before the captain was well got into the boat, he was told that a canoe, with some men in her, were making off with one of the iron stanchions from the opposite gangway. The captain immediately ordered them to fire over the canoe,

but not to kill any body. There was such a noise on board, that his orders were not distinctly heard, and the poor thief was killed at the third shot. The rest that were in the canoe leaped overboard, but got in again just as Capt. Cook came up to them, and threw overboard the stanchion. One of the men sat laughing as he laded the blood and water out of the boat, but the other looked very serious and dejected. We afterwards had reason to think that the father of the latter had been shot. The natives retired with great precipitation at this unhappy accident; but their fears were in some measure allayed by the captain's following them into the bay, and making them presents. We found fresh water ashore, which we very much wanted. One would have imagined that the fatality attending one poor fellow's thieving, would have discouraged them from making any more attempts of the like nature; but no sooner was our kedge anchor out, but two men came from the shore, wanting to take away the buoy, not knowing what was fastened to it. Left they should take away the buoy, a shot was fired, which fell short of them: of this they took not the least notice; but when another was fired, which went over their heads, they instantly let go the buoy, and returned to the shore. This last shot had a good effect; for by this they saw that they were not safe at any distance, and they were ever afterwards much terrified at the sight of the musket. However, they still continued to practise their art of thieving; but it was judged better to put up with it, as we did not intend making a long stay here. A man who had the appearance of a chief came off to us with a pig upon his shoulder; he was presented with a hatchet in return, and afterwards great numbers

numbers of the natives came along-side, and carried on some traffic. Peace being now established, another party of men were sent ashore. The natives received us civilly, and we got a supply of water, as well as some hogs and fruit. On the 9th, another party went ashore, and were met by a chief of some consequence, attended by several of the natives. Presents were made to him; but we could not prevail on him to return with us to dinner. In the afternoon another party was made to the southern cove, which came to the house that belonged to the man we had killed. His son inherited his substance, which consisted of five or six pigs; but he fled at our approach. We should have been glad to have seen him, as we wanted to convince him that we bore the nation no ill-will, though we killed his father, and to have made him some presents by way of a small compensation. We collected a good many pigs and other refreshments this day, and returned on board in the evening. We also obtained several pigs from the different canoes that came along-side of us on the 10th instant; and by this time we had a sufficient number to afford the crews a fresh meal. A party was made on this day, which was successful in the purchase of several more pigs, and a large quantity of fruit. We had now a fine prospect of getting a supply of all manner of refreshments; but our expectations were frustrated, by some of our crew having been on shore, and selling them such articles as they had never before seen, which made the natives despise the hatchets and nails, which before they so much prized. As this was the case, and we had much need of refreshment, having been a long time at sea, it was determined to remove our quarters, and make sail for Otaheite, hoping to fall in with some of those islands discovered by the Dutch and other navigators, where our wants might be effectually relieved. We had been nineteen weeks at sea, living the whole time upon salt provisions, and therefore could not but want some refreshments; yet we must own, with grateful acknowledgments to goodness supreme, that on our arrival here, it could scarcely be said we had one sick man, and but a few who had the least complaint. This Capt. Cook attributed to the number of antiscorbutic articles on board, and to the great attention of the surgeon, who was very careful to apply them in time. On Monday, the 11th, at three o'clock, we weighed from St. Christina, and stood over for La Dominica, and the night was spent in plying between the two isles. On the 12th, we steered to the S. and at five P. M. Resolution Bay bore E. N. E. half E. distant five leagues, and the island of Magdalena about nine leagues, which was the only view we had of it.

But we shall now in our narrative return to the Marquesas. These are five in number, namely, La Magdalena, St. Pedro, La Dominica, Santa Christina, and what we named Hood's Island, which is the northernmost, in latitude 9 deg. 26 min. S. Its breadth is unequal, and it is about 16 leagues in circumference. The surface is full of rugged hills rising in ridges, which are disjoined by deep valleys clothed with wood, as are the sides of some of the hills; the aspect is, however, barren; yet it is nevertheless inhabited. St. Pedro is about three leagues in circuit, and lies south four leagues and a half from the east end of La Dominica. Christina lies under the same parallel, four leagues more to the west. This isle is nine miles in length, and about twenty-one in circumference. These islands occupy one degree in latitude, and nearly half a degree in longitude, namely, from 138 deg. 47 min. to 139 deg. 13 min. W. which is the longitude of the west end of Dominica.

The port of Madre de Dios, which was named Resolution Bay, is situated not far from the middle of the west side of St. Christina, under the highest land in the island. The south point of the bay is a steep rock, terminating in a peaked hill. The north point is not so high, and rises in a more gentle slope. In the bay are two sandy coves; in each of which is a rivulet of excellent water. For wooding and watering, the northern cove is most convenient. We saw here the little cas-

cade mentioned by Quiros, Mendana's pilot; but the village is in the other cove.

The productions of these isles, which came within our knowledge, are nearly the same as at the Society Isles, namely, hogs, fowls, plantains, yams, and some other roots; also bread fruit and cocoa-nuts, but of these not in abundance. Trifles highly valued at the Society Isles, are lightly esteemed here, and even nails, at last, in their opinion, lost their value.

The natives, in general, are the finest race of people in this sea. They surpass all other nations for shape and regular features. The affinity of their language to that of Otaheite, and the Society Isles, shews that they are of the same nation. Oedidee could converse with them, though we could not. The men are curiously tattooed, from head to foot, with various figures, that seem to be directed more by fancy than by custom. These punctures cause the skin to appear of a dark hue; but the women who are not much punctured, and youths who are not at all, are as fair as some Europeans. The men are about five feet six inches high; but none of them were fat and lusty like the Earees of Otaheite, yet we saw not any that could be called meagre. Their eyes are neither full nor lively; their teeth not so good as those of other nations, and their hair is of many colours, except red. Some have it long; the most prevailing custom is to wear it short; but a bunch on each side of the crown they tie in a knot. In trimming their beards, which is in general long, they observe different modes: some part it, and tie it in two bunches under the chin; some plait it, some wear it loose, and others quite short. Their cloathing is much the same as at Otaheite, but not so good, nor in such plenty. The men, for the most part, cover their nakedness with the Marra, which is a slip of cloth passed round the waist, and between the legs. This simple dress is quite sufficient for modesty, and the climate. The women wear a piece of cloth round their loins, like a petticoat, reaching below the middle of their legs, and a loose mantle over their shoulders. Their head-dress, and what seems to be their principal ornament, is a broad fillet, made curiously of the fibres of the husks of cocoa-nuts, in the front of which is placed a mother-of-pearl shell, wrought round to the size of a tea-saucer. Near this is one smaller, of very fine tortoiseshell, perforated in curious figures; and in the center is another round piece of mother-of-pearl, about the size of half a crown; before which is another piece of perforated tortoiseshell the size of a shilling. Some have this decoration on each side, in smaller pieces; and all have annexed to them the tail-feathers of cocks or tropic birds, which stand upright, and the whole makes a very singular ornament. Round the neck they wear a kind of ruff or necklace of light wood, covered with small red peas, fixed on with gum. Round their legs and arms they have bunches of human hair, fastened to a string. Instead of hair they sometimes use short feathers; but all these ornaments we seldom saw on the same person. The chief, indeed, who came to visit us, was completely dressed in this manner; but their ordinary ornaments are necklaces and amulets composed of shells, &c. All had their ears pierced, yet we saw not any with ear-rings.

Their houses are in the valleys, and on the sides of hills, near their plantations, built after the same manner as at Otaheite, but much meaner, being only covered with the leaves of the bread-tree. Most of them are built on a pavement of stone, an oblong, or square, which is raised above the level of the ground. These pavements are likewise near their dwellings, on which they eat and amuse themselves. In their eating these people are not very cleanly. They are also dirty in their cookery. They dress their pork in an oven of hot stones; but fruit and roots they roast, and having taken off the rind, they put them into a trough with water, out of which we have seen both men and hogs eat at the same time. Once we saw them make a batter of fruit and roots in a vessel that was loaded with dirt, and out of which the hogs had been that moment eating, without washing either that, or their hands, which

View of RESOLUTION BAY, in the MARQUESAS.

which were equally dirty; but the actions of a few individuals are not sufficient to fix a custom on a whole nation. Their weapons are clubs and spears: They have also slings with which they throw stones with great velocity, but not with a good aim. Their canoes are made of wood, and the bark of a soft tree, which grows near the sea, and is very proper for the purpose: Their length is from sixteen to twenty feet, and their breadth about fifteen inches. The head and stern are formed out of two solid pieces of wood; the former is curved, and the latter ends in a point; the latter, which projects horizontally, is decorated with a rude carved figure, having a faint resemblance of a human shape and face. Some of these canoes have a latteen sail, but they are generally rowed with paddles. The only tame fowls we saw were cocks and hens; and of quadrupeds no other than hogs; but the woods were well inhabited by small birds, whose plumage is exceeding beautiful, and their notes sweetly varied. We did not shoot as many of them as we might have done, from apprehensions of alarming and terrifying the natives.

On Sunday, the 17th, at ten o'clock A. M. having steered W. by S. land was seen bearing W. half N. being a chain of low islets, connected together by a reef of coral rocks. We ranged the N. W. coast till we came to a creek or inlet, and which seemed to have a communication with a lake in the center of the island. Having a desire of surveying these half-drowned islets, we hoisted out a boat, and sent the master in to sound. While the Resolution ran along the coast, the natives were seen in different places armed with long spears and clubs, and a group of them were observed on one side of the creek. As they shewed some signs of a friendly disposition, two boats were sent ashore well armed, under the command of Lieutenant Cooper, who was accompanied by Mr. Forster. We saw our people land without any opposition from a few natives standing on the shore; but perceiving, a little time after, forty or fifty, all armed, coming down to join them, we stood closer in shore, with the view of supporting our people in case they should be attacked; but our boat returned without any thing of this kind having happened. By Mr. Cooper we were informed, that many of the natives hovered about the skirts of the wood with spears in their hands; and that the presents he made to those on shore were received with great coolness. When their reinforcement arrived, his party thought it most prudent to embark, especially as the captain had ordered them to avoid, if possible, an attack. When the crew, &c. were all in the boats, some of the natives attempted to push them off, others seemed disposed to detain them; at length they suffered our people to depart at their leisure. One of them procured a dog for a single plantain, which led us to conjecture this was not a production of their island; indeed, they saw no fruit but cocoa-nuts, of which they could get, by barter, only two dozen. When the master returned from sounding in the creek, he reported that there was no passage from thence into the lake; and that the creek, at its entrance, was fifty fathoms wide, and thirty deep; farther up thirty wide, and twelve deep; that the bottom was rocky, and the sides bounded by coral rocks. We were not inclined to run the ship into such a place, and therefore, after having formed some judgment of the natives, we prepared to proceed on new discoveries.

The natives call this island Tiookea, which was discovered and visited by Commodore Byron. It is of an oval form, about thirty miles in circumference, and lies in 14 deg. 27 min. 30 sec. S. latitude, and in 144 deg. 56 min. W. longitude. They, and perhaps all the inhabitants of the low islands, are of a much darker colour than those of the higher ones, and seem more savage in their nature. These low islands are not so fertile as some others; the inhabitants are much exposed to the sun; they depend upon the sea for their support, by which means they are darker in colour, and more robust; yet there is no doubt of their being of the same nation. A fish is an emblem of their pro-

No. 17.

fession, and a figure of one was marked on the bodies of the men, who in general are well made, stout, and fierce.

On Monday, the 18th, we saw such another island as that we had left, to the westward, which we reached by eight o'clock A. M. We ranged the S. E. side at one mile distant from the shore. It lies S. W. by W. two leagues from the west end of Tiookea, in 14 deg. 37 min. S. latitude, and in 145 deg. 10 min. W. longitude. These we apprehend to be the same, to which Commodore Byron gave the name of George's islands. We left them on the 19th, and at seven o'clock A. M. discovered another of these half-overflowed islands, which are so common in these southern latitudes. In general they are surrounded with an unfathomable sea, and their interior parts are covered with lakes, which would be excellent harbours, were they not shut up from the access of shipping, which, according to the report of the natives, is the case with most of them. Of the great number we ranged, not a passage was to be discovered into one of them. We were told, that they abound with fish, particularly turtle, on which the natives subsist, and sometimes exchange with the inhabitants of the higher islands for cloth, &c. This island, (by which, while in this part of the ocean, we would be understood to mean a number of little isles, or islets, connected together into one by a reef of coral rocks) is about five leagues long, and three broad, and is in 15 deg. 26 min. S. latitude, and in 146 deg. 20 min. longitude. Near the south end we discovered from the mast head, distant four leagues, another of these low isles; soon after a third, bearing S. W. by S. It extends W. N. W. and E. S. E. in which direction its length is twenty-one miles, but its breadth not more than six. It appears, in every respect, like the rest, only it has fewer islets, and less firm land on the reef which furrounds the lake. While ranging the north coast, we saw people, huts, canoes, and what appeared to be stages for drying of fish. The natives were armed with the same weapons, and seemed to be the same sort, as those in the island of Tiookea. Approaching now the west end we saw a fourth island, bearing N. N. E. It lies six leagues west from the first. These four clusters, we named Palliser's isles, in honour of Sir Hugh Palliser, comptroller of the navy.

On Wednesday the 20th, at day-break, hauling round the west end of the third island, we found a great swell rolling in from the S. by which we knew that we were clear of these low islands; and being not within sight of land, we made the best of our way for Otaheite, having a strong gale at east, attended with showers of rain. It is here necessary to take notice, that this part of the ocean, from the latitude 20 deg. down to 12 deg. and from the meridian of 138 deg. to 150 deg. W. is so strewed with low isles, that a navigator cannot proceed with too much circumspection; but whether these isles be any of those discovered, and laid down in the charts of the Dutch navigators, cannot be determined with any degree of certainty; especially when we consider, that their discoveries are not handed down to us with sufficient accuracy. Thursday, the 21st, we made the high land of Otaheite; by sun-set was in with Point Venus, and the next morning, at eight o'clock, anchored in Matavai Bay, in seven fathoms water. Our arrival was no sooner known to the natives, than they paid us a visit, expressed the most lively congratulations, and supplied us with fish and fruit sufficient for the whole crew. Our first business was to erect tents for the reception of such of our people as were required on shore. Sick we had none, for the refreshments we got at the Marquesas, had been the means of removing every complaint of the scorbutic kind, and of preserving the whole crew in good health. We also sent ashore Mr. Wales's instruments; our chief reason for putting into this place being to afford him an opportunity to ascertain the error of the watch by the known longitude, and to determine precisely its rate of going.

On Sunday, the 24th, Otoo and other chiefs, with a train of attendants, brought us ten large hogs, besides fruit, which made their visit exceedingly agreeable. As

2 P

the

the king's coming had been announced to us, and knowing how much it was our interest to keep this chief our friend, Capt. Cook met him at the tents, and conducted the whole of this retinue, with himself, on board, where they staid dinner, and appeared highly pleased with their reception. Next day, notwithstanding we had much thunder, lightning, and rain, the king came again to see us, and brought with him another present, consisting of a large quantity of refreshments. When at Amsterdam, we had collected, among other curiosities, some red parrot feathers. These precious valuables procured us hogs, fruit, and every other thing the island afforded. Our having them was a fortunate circumstance; for our stock in trade being greatly exhausted, without these we should have found it difficult to have supplied the ship with necessary refreshments. When we put into this island, we intended to stay no longer than Mr. Wales had made the necessary observations for the purposes already mentioned; and supposing we should meet with no better success than we did the last time we were here. But the reception we had already met with, and the few excursions we had made to the plains of Matavai and Oparree, convinced us of our error; for at these two places we found built, and building, a large number of canoes and houses of every kind: people living in spacious houses, who had not a place to shelter themselves in eight months before; also several hogs in every house, with many other signs of a rising state. On account of these favourable circumstances, we resolved to make a longer stay at this island, and to repair the ship, which was now indispensably necessary. Accordingly the empty casks and sails were got ashore, the ship was ordered to be caulked, and the rigging to be overhauled.

On Tuesday, the 26th, Capt. Cook, accompanied by some of the officers and gentlemen, went down to Oparree, to visit Otoo by appointment. When arrived, we saw a number of large canoes in motion, but were much surprized at perceiving more than three hundred ranged along shore, all completely equipped and manned; besides a vast number of armed men upon the shore. We landed in the midst of them, and were received by a vast multitude, some under arms, and some not. The cry of the former was Tiyo no Towha, and of the latter was Tiyo no Otoo. Towha, we afterwards learnt was admiral, or commander of the fleet. Upon our landing we were met by a chief, named Tee, uncle to the king, of whom we enquired for Otoo. Soon after we were met by Towha, who received us in a friendly manner. He took Capt. Cook by the one hand, and Tee by the other, and dragged him, as it were, through the crowd that was divided into two parties, both of which proclaimed themselves his friends, by crying out Tiyo no Tootee. One party wanted him to go to Otoo, and the other to remain with Towha. When come to the usual place of audience, Tee left us to go and bring the king. Towha insisted on the captain's going with him, but he would not consent. When Tee returned, he took hold of his hand in order to conduct him to the king. Towha was unwilling he should sit down, and desired him to go with him; but this chief being a stranger, he refused to comply. Tee was very desirous of conducting the captain to the king; Towha opposed, and he was obliged to desire Tee to desist, and to leave him to the admiral and his party, who conducted him down to the fleet. Here we found two lines of armed men drawn up before the admiral's vessel, in order to keep off the crowd that we might go on board; and when the captain made an excuse, a man squatted down, and offered to carry him, but he would not go. At this time Towha quitted us, without our seeing which way he went, nor would any one inform us. We were now jostled about in the crowd. We saw Tee, and inquiring of him for the king, he told us he was gone into the country of Matavai, and he advised us to repair to the boat, which we accordingly did, as soon as we could get collected together. When in our boat we took our time to reconnoitre the grand fleet. We told an hundred and sixty large double canoes, equipped, manned, and armed;

but we believe they had not their full complement of rowers. The chiefs and all those on the fighting stages, were habited in cloth, turbans, breast plates, and helmets. Some of the latter seemed much to incumber the wearer. Be this as it may, the whole of their dress added a grandeur to the prospect, and they were so complaisant as to shew themselves to the best advantage. Their vessels were full dressed with flags, streamers, &c. so that the whole fleet made such a noble appearance, as we had never before seen in this sea, and what no one could have expected. Their instruments of war were clubs, spears, and stones. The vessels were ranged close along side of each other, having their heads to the shore, and their sterns to the sea. The admiral's vessel was nearly in the center. We counted, exclusive of the vessels of war, an hundred and seventy sail of smaller double canoes, all rigged with mast and sail, which the war canoes had not. These we judged were designed for transports, victuallers, &c. for in the war canoes were no sorts of provisions whatever. We conjectured that in these three hundred and thirty vessels there were no less than seven thousand seven hundred and sixty men, a number incredible, especially as we were told they all belonged to the districts of Attahourou and Ahopatea. Most of the gentlemen, by their calculations, thought the number of men belonging to the war canoes exceeded this, allowing to each war canoe forty men, and to each of the small canoes eight. Having viewed this fleet, it was our intention to have gone on board, could we have seen the admiral. We enquired for him but to no purpose. At last Tee came, by whom we were informed, that Otoo was gone to Matavai. This intelligence gave rise to new conjectures. When we got to Matavai, our friends told us, that this fleet was part of the armament intended to go against Eimeo, whose chief had thrown off the yoke of Otahitei. We were still at a loss to account for the flight of Otoo from Oparree, for we were informed he neither was nor had been at Matavai. We therefore went thither again in the afternoon, where we found him, and learnt, that the reason of his absconding in the morning was, because some of his people had stole some of the captain's clothes which were washing at the tents, and he feared restitution would be demanded. He repeatedly asked Capt. Cook if he was not angry, nor could he be easy till assured, that the pilferers might keep the stolen things. Towha also was alarmed, thinking that Capt. Cook was displeased, and jealous of seeing such a force so near us, without knowing its destination. It happened unluckily that Oedidee was not with us in the morning; for Tee, who was the only man we could depend on, served rather to increase our perplexity. Thus by mutual misunderstanding, we lost a favourable opportunity of scrutinizing the naval force of this isle, and making ourselves better acquainted with its manœuvres. It was commanded by an intelligent and brave chief, who was disposed to have satisfied us in all questions we had thought proper to ask; and from the nature of the objects, which were before us, we could not well have misunderstood each other. All mistakes being now rectified, and presents having passed between Otoo and Capt. Cook, we took leave and returned on board.

On Wednesday, the 27th, in the morning, Towha sent us by two of his servants, two large hogs, and some fruit. The bearers of this present had orders not to receive any thing in return, nor would they when offered them. Some of our gentlemen went with the captain in his boat down to Oparree, where we found Towha, and the king; after a short visit, we brought them both on board, together with Tarevato, the king's younger brother. When we drew near the ship, the admiral, who had never seen one before, expressed strong signs of surprize, and when on board, he was shewed, and beheld every part of it with great attention. When Towha retired after dinner, he put a hog on board without our knowledge, or waiting for a return; and soon after Otoo and his attendants departed also. There was a jealousy between these two chiefs, on what account we could not learn; never-

nevertheless Otoo paid Towha much respect, and was desirous we should do the same. Otoo had the day before frankly declared, that the admiral was not his friend. When on board, both these chiefs requested our assistance against Tiarebou, notwithstanding there was no rupture at this time between the two states, and they had informed us, that their joint forces were intended against Eimeo. The reason of this duplicity we could not find out: perhaps they were desirous of annexing that kingdom, by our alliance, to their own, as it was formerly: be that as it may, as Capt. Cook gave them no encouragement, we heard no more on this subject. Our endeavours to maintain a neutrality, we believe, were well received by both parties; for next day, being Thursday, the 28th, Wahea-toua, king of Tiarebou sent us a present of a hog, for which he requested a few red feathers, which were accordingly sent him. On the 29th, early in the morning, Otoo, Towha, and several chiefs, again paid us a visit, and brought with them not only provisions, but some of the most choice curiosities of the island, and among other returns, with which they seemed well pleased, the captain did not forget to repay the civilities we had received from the admiral, Towha. We must not omit taking notice, that the preceding evening, one of the natives was detected in an attempt to steal a cask from the watering place, and being caught in the act, he was sent on board, and we put him in irons. Otoo and the other chiefs saw the culprit in this situation, and Otoo earnestly interceded in his behalf, requesting with many intreaties, that he might be set at liberty; but he was told by Capt. Cook, that as our people were punished for the least offence committed against the natives of Otaheite, it was but justice to punish this man also, which he was determined to see done in an exemplary manner, especially as it was well known, he, Otoo, would not do it himself. The man, in consequence of the captain's resolution, was conducted ashore to the tents, where a guard was ordered out under arms, and the offender tied up to a post, Otoo, his sister, and many of the natives being spectators. Otoo and his sister begged hard for the man; with whom the captain expostulated, telling Otoo, how unjust it was in his people to steal from us who were their friends, and who never took any thing from them without giving certain articles, which he enumerated, in exchange. The captain laboured also to convince Otoo, that the punishment he was about to inflict on this man might prove the means of saving the lives of others of his subjects; for if they continued in such kind of criminal practices, some would certainly, one time or another, be shot dead. We believe he pretty well understood our commander, and seemed satisfied, only he desired the criminal might not be Matteerou, (or killed.) The concourse of people was by this time very great. The captain therefore drew a line for them at a proper distance, and then, in the presence of them all, ordered the fellow two dozen of lashes with a cat-o-nine-tails. This chastisement he received with great firmness, and was then set at liberty. Upon this the natives were going away, apparently not much pleased; which Towha perceiving, who all the time had remained silent, though very attentive to every thing going on, he stepped forward, and harangued them for near half an hour, in short sentences. We understood little of his speech, but from what we could gather, it was a recapitulation of Capt. Cook's: he mentioned several advantages they had received from our people; and having reprimanded them for their present conduct, he exhorted them to adopt and pursue a different one for the future. His action was remarkably graceful, and the profound attention of his audience, proved him to be a masterly speaker. Otoo said not one word. When Towha had concluded his harangue, the marines were ordered to go through their exercise. They fired in volleys with ball, and being very quick in charging, and in their manoeuvres, it is scarcely possible to describe the astonishment of the natives during the whole time, particularly the amazement of those to whom this sight was quite a

novelty. The chiefs with all their retinue, now took leave, we are apt to think not less frightened than pleased at what they had seen. In the evening Mr. Forster and his party returned from an excursion they had made to the mountains, where they had spent the night. Mr. Forster collected some new plants, and found others which grew in New Zealand. He saw the island of Huaheine, situated forty leagues to the westward; whereby a judgment may be formed of the height of the mountains of Otaheite.

On Saturday the 30th, we saw ten war canoes go through part of their paddling exercise. They were properly equipped for war, and in landing we observed, that the moment the canoe touched the ground, all the warriors leaped out, and with the assistance of a few people on shore, dragged the canoe on dry land to its proper place; which done, every one walked off with his paddle, &c. Such was their expedition, that in five minutes time after putting ashore, no one could tell that any thing of the kind had been going forward. The warriors on the stage encouraged the rowers to exert themselves, and we observed some youths in the curved stern elevated above the rest, with white wands in their hands, placed there perhaps to look out, and give notice of what they saw. The king's brother Tarevato, knowing that Mr. Hodges made drawings of every thing curious, intimated of his own accord, that he might be sent for; and thus an opportunity was unexpectedly afforded our draughtsman, to collect materials for a picture of the Otaheite fleet, as it appeared when assembled at Oparree. Being present when the warriors undressed, we could scarcely conceive how it was possible for them to stand under the quantity of cloth with which they were clad, in time of action. Many rounds of this composed a kind of turban or cap, which, in the day of battle, might prevent a broken head, and some by way of ornament, had fixed to these caps dried branches of small shrubs, interwoven with white feathers.

On Sunday the 1st of May, several chiefs supplied us with a large quantity of provisions; and the day following our friend Towha sent us a present of a hog, and a boat loaded with various sorts of fruit and roots. We received also another present from Otoo, brought by Tarevato. On the 3d, upon examining into the condition of our provisions, we found our biscuit much decayed, and that the airing we had given it at New Zealand was not of the service we expected; we therefore were now obliged to have it on shore, where it underwent another airing and picking, in doing which we found a great part thereof wholly rotten and unfit for use. We attributed this decay of our bread to the ice we frequently took in, which made the hold damp and cold, which, when to the north, was succeeded by a contrary extreme of intense heat; but whatever was the real cause of our loss, it put us to a scanty allowance of this valuable article, and we had bad bread to eat besides. On Thursday the 5th, in the afternoon, the botanists made another excursion up the country, to the mountains; they returned the evening of next day, and in their way made some new discoveries. On Saturday the 7th, in the morning, we found Otoo at the tents, of whom the captain asked leave to cut down some trees for fuel. He took him to some growing near the sea shore, the better to make him comprehend what sort we wanted; and he seemed much pleased when he understood, that no trees should be cut down that bore any kind of fruit. This assurance from us he repeated several times aloud to the people about us. In the afternoon we were honoured, when on board, with a visit from the whole royal family, consisting of Otoo, his father, brother, and two sisters: but this was properly her father's visit, who brought the captain a complete mourning dress, a present he much valued; for which he had in return whatever he desired, which was not a little; and to the rest of the company were presented red feathers. The whole were then conducted ashore in the captain's boat. Otoo and his friends were so well pleased with the reception they met with, that, at parting, we were granted the liberty of cutting down

down as many trees as we wanted, and what fort we pleased.

On Sunday the 8th, our friendly connections with the natives were interrupted by the negligence of one of our centinels at the tents, who had his musket carried away, he having slept or quitted his post. We had received an imperfect account of this affair from Tee, but we understood enough to know that something had happened, which alarmed the king, who Tee said, was under great apprehensions of being massacred. We therefore lost no time in going ashore; and when landed were informed of the whole transaction by the sergeant who commanded the party. Most of the natives had fled at our approaching the tents. Tarevatoe slipped from us in a moment, and a few besides Tee had courage to remain. We went immediately in search of Otoo, and in the way endeavoured to allay the fears of the people. Having advanced some distance from the shore into the country, Tee on a sudden stopped, and advised our returning, saying, he would proceed to the mountains, whither Otoo had retired, and inform him, that we were still his friends; a question, and if we were angry, that had been asked a number of times by the natives. The captain now thought it was to no purpose to go farther, we therefore took Tee's advice, and returned aboard. After this Oedidee was dispatched to the king, to let him know his fears were groundless, seeing the captain required of him only what was in his power, the return of the musket. A short time after the departure of Oedidee, we saw six large canoes coming round Point Venus. Suspecting that one belonging to these had committed the theft, it was resolved to intercept them, for which purpose a boat was put off, and another ordered to follow. One of the canoes was ahead of the rest, and seemingly making for the ship. We put along side of her, and found two or three women whom we knew. They said, they were going aboard the ship with a present to the captain, and that the other canoes were laden with fruit, hogs, &c. Satisfied with this intelligence, the captain recalled his orders for intercepting them, thinking they also, as well as this one, were bound for the ship. We therefore left this single canoe within a few yards of it, and proceeded for the shore to speak with Otoo; but upon landing we found he had not been there. Looking behind us we saw all the canoes, the one we had left near the ship not excepted, making off in the greatest haste. Vexed at being thus deceived, we resolved to pursue them, and as we passed the ship, Capt. Cook gave orders to send out another boat for the same purpose. We overtook and brought five out of the six along-side, but the one by which we were outwitted got clear off. This, in which were only a few women, had actually amused us with false stories, while the others, in which were most of their effects, were to have made their escape. In one of the prizes was a friend of Mr. Forster's, who had hitherto called himself an Earce, also three women, his wife, daughter, and the mother of the late Toutaha. This chief we would have sent to Otoo; but he made many excuses, saying, he was of a rank too low for such an honourable embassy; that he was no Earce, but a Manahouna; that an Earce ought to be sent to speak to an Earce; and that as there were none of this high rank but Otoo and the captain, it would be much more proper for the captain to go. At this time Tee and Oedidee came on board, and assured us, that the man who had stole the musket was from Tiarabou; and that we might credit their declaration, they desired us to send a boat to Waheatoua, the king of Tiarabou, offering to go themselves in her, and recover the musket. This story, though not altogether satisfactory, carried with it an air of probability; and thinking it better to drop the affair altogether, the captain suffered Mr. Forster's friend to depart with his two canoes. The other three belonged to Maritata, a Tiarabou chief, on which account it was determined to detain them; but as Tee and Oedidee both assured us, that Maritata and his people were innocent, they were permitted to go off with their canoes also; and the captain desired Tee to

tell Otoo, that he should give himself no farther concern about the musket, being satisfied none of his people had committed the theft. We had now given it up, concluding it to be irrecoverably lost, but in the dusk of the evening it was brought to the tents, together with other things we had not missed, by three men, who, as well as some other people present, affirmed, that it was by one belonging to Maritata, by whom the things had been stolen; whence we concluded both Tee and Oedidee had intentionally deceived us. Every one present at the restoration of the things, and even they who came afterwards, claimed a reward, all pretending to have had some hand in recovering them. Nuno particularly, a man of some note, and with whom we were acquainted when here in 1769, played his part in this farce exceeding well. He came with the most savage fury imaginable expressed in his countenance and gestures; and having a large club in his hand, he laid it about him most violently, in order to convince us, how he alone, and to make us sensible in what manner he had killed the thief; when at the same time we all knew that he had been at home, and not out of his house the whole time, which shews that human nature, respecting her original passions and powers, are the same in every clime, where the same instincts, the same perceptive faculties, and the same self love universally prevail.

On Monday the 9th, Tee came again aboard to inform us, that Otoo was at Oparree, and requested of the captain to send a person, to let him know if he was still his friend. He was asked, why he had not done this himself, as he was desired; he made a trifling excuse, but we thought he had not seen Otoo. As the natives brought not any thing to market, and a stop was consequently put to our trade with them, it was judged time ill spent to send any more fruitless messages; a party therefore set out, with Tee in our company, and having reached the utmost boundaries of Oparree, the king at last, when we had waited a considerable time, made his appearance. The first salutations being over, and having taken our seats under the shade of some trees, Otoo desired the captain to parou (or speak). Capt. Cook began with blaming the king for giving way to groundless alarms, he having always professed himself his friend, and was displeased only with those of Tiarabou, who were the thieves. The captain was then asked, how he came to fire at the canoes? By way of excuse, he told them they belonged to Maritata, one of whose people had stolen the musket, and added the captain, "If I had them in my power, I would destroy them, or any other belonging to the district of Tiarabou." We knew this declaration would please them, from the natural aversion the one kingdom has to the other; and it was enforced by presents, which we believe were the strongest arguments in favour of a reconciliation: for after these weighty reasons, things were soon restored to their former state, by Otoo's promising, on the word of a king, that we should be supplied next day with provisions and fruit as usual. Peace and amity being now once more established, we accompanied him to his proper residence at Oparree, where he obliged us with a view of some of his dock-yards, (for so they may well be called) where we saw several large canoes, some building, and others lately built, two of which were the largest we had any where seen. Having fully gratified our curiosity, we repaired on board with Tee in our company, who, after he had dined with us, went to acquaint Happi, the king's father, that all differences were brought to a happy conclusion. But we had reason to think this old chief was not satisfied with the terms of the accommodation; for all the women, and these not a few, were sent for out of the ship, and the next morning, no supplies whatever were brought, and we were obliged for the present, to be contented with some fruit sent us by our friends from Oparree. But in the afternoon, Otoo himself came to the tents with a large supply; and presently after more fruit was brought us than we knew what to do with: for the natives, we believe, thought themselves injured equally with ourselves; and we knew they had

every thing ready for our market, when they were permitted to bring them. Otoo desiring to see some of the great guns fired, his wish was complied with, but the sight, which was entirely new, gave him as much pain as pleasure; but in the evening, when we entertained him with a shew of fire-works, he expressed much greater satisfaction. We have before had occasion to observe, that these people were continually watching opportunities to rob us; and seeing the offenders were continually screened, we cannot but think, that the chiefs either encouraged, or had not power to prevent thievish practices. We thought it more extraordinary that they should so often attempt what they knew might cost them their lives; and they well knew also they should be obliged to make restitution, if the article stolen was of any great value. They were fully sensible of these consequences, and therefore, the moment a theft was committed, every one took the alarm, and went off with his moveables as fast as possible; but if the article was a trifle, or such as we usually gave them, no commotion happened, because, in general, little or no notice was taken of it. Whether we obliged them to make restitution or not, the chief frequently secreted himself, and he must be reconciled before the people were permitted to bring in any refreshments: and we are persuaded it was by his orders the supplies were detained from us. These they imagined we could not do without, not considering, that their war canoes, dwellings, and even fruit, were entirely in our power. Their propensity to thieving must be almost irresistible, otherwise our uniform conduct towards them would have had its due weight: for, except detaining their canoes for a time, we never touched the smallest article of their property. When two extremes were under our consideration, we always chose the most equitable and mild; and frequently settled disputes, or effected a reconciliation, by trifling presents, notwithstanding we were the party aggrieved. A present to a chief always succeeded to our wish, and put things on a better footing than they had been before. In all our differences they were the first aggressors; and our people very seldom infringed the rules prescribed by our commander. Had the captain pursued less eligible methods, he might have been a loser in the end; for had he destroyed any of the natives, or part of their property, all he could expect would have been the empty honour of obliging them to make the first advances towards an accommodation. Nor is it certain this would have been the event. They were made our fast friends by three motives; their own benevolent disposition, mild treatment from us, and the dread of our fire-arms. Had we not continually had recourse to the second, the first would have been of little use to us; and a too frequent application of fire arms might have excited revenge, perhaps taught them in a little time, that they were not such terrible things as they had conceived them at first to be. They knew their strength in the superiority of their numbers, and who can say what an enraged multitude might do by undauntedly closing with even an European enemy.

On Wednesday, the 11th, a large supply of fruit came to market, and among the rest a present from Towha, the admiral; for which the captain made a suitable return. At this time all the necessary repairs of the ship being nearly finished, it was resolved to leave Otaheite in a few days; to this end every thing was ordered off from the shore that the natives might see we were about to leave them. On the 12th, Oherea, whom we had not seen since 1769, paid us a visit, bringing with her hogs and fruit. Otoo also came soon after her, with a number of attendants, and a large quantity of provisions. Capt. Cook was very generous in his returns of presents, and in the evening entertained them with fire-works, thinking it might be the last time we might see these friendly people who had so liberally relieved our wants.

On Friday, the 13th, we were not ready to sail, but the wind was favourable, and the weather fair. Oedidee was not yet returned from Attahourou, and various reports were circulated concerning him. Some said he was at Matavai; others, that he intended not

to return; and there were those who affirmed he was at Oparree. With a view of discovering the truth, a party of us repaired to Oparree, where we found him. Towha was also here, who, notwithstanding he was afflicted with a swelling in his feet and legs which had taken away the use of them, had nevertheless resolved to see the captain before he sailed, and had advanced with this intent thus far on his journey. The day being far spent, we were obliged to shorten our stay, and after having seen Otoo, we returned on board with Oedidee. This youth, we found, was desirous of remaining at Otaheite; the captain therefore told him he was at liberty to remain here, or to quit us at Ulitea, or to go with us to England. That if the latter was his choice, he must look upon him as his father, as it was very probable he would never return to his own country. The youth threw his arms about his neck, wept much, and said, many of his friends persuaded him to remain at Otaheite. Oedidee was well beloved in the ship; on which account every one was persuading him to go with us. But Capt. Cook thought it an act of the highest injustice to take a person from these isles, when there was not the least prospect of his returning, under any promise which was not in his power to perform. Indeed, at this time, it was quite unnecessary, seeing many young men offered voluntarily to go with us, nay, even to remain and die in Pretanee, as they call our country. Several of our gentlemen would have taken some as servants, but Capt. Cook prudently rejected every solicitation of this kind, knowing, they would be of little use to us in the course of the voyage; besides, what had still greater weight with the captain, was, that he thought himself bound to see they were afterwards properly taken care of.

On Saturday, the 14th, early in the morning, Oedidee came on board, and Mr. Forster prevailed upon him to go with us to Ulitea. Towha, Poatatu, Oamo, Happi, Oherea, and many more of our friends paid us a visit. The wife of Towha was with him, and this chief was hoisted in, and placed on a chair, on the quarter deck. Among other presents, we gave the admiral an English pendant, which, after he had been instructed in the use of it, pleased him more than all the rest. Soon after these friends had left us, we saw a number of war canoes coming round the point of Oparree, to which place the captain accompanied by some of our officers and gentlemen, hastened down, in order to have a nearer view of the fleet. We arrived there before all the canoes were landed, and had an opportunity of observing in what manner they approached the shore. No sooner had they got before the place where they intended to land, than they formed themselves into divisions, consisting of three or more canoes lashed square and along-side of each other; after which each division paddled in for the shore, one after another, in so judicious a manner, that they formed, and closed a line along the shore to an inch. The rowers were encouraged by their warriors, and directed by a man who stood with a wand in his hand at the head of the middlemost vessel. By words and actions he directed the rowers when all should paddle, and when either the one side or the other should cease, &c. for the steering paddles were not sufficient to direct them. They observed all these motions with such quickness, and answered so exactly, as plainly shewed them to be expert in their business. Mr. Hodges made a drawing of them, as they lay ranged along the shore, after which we took a nearer view, by going on board several of them.

This fleet, which consisted of forty sail, belonged to the little district of Tettaha, and were come to Oparree, to be reviewed before the king, as the former fleet had been, the manner of whose equipment we have already described, and as that of this fleet was exactly the same, a repetition must be here needless. On this fleet were attending some small double canoes, called Marais, having in their fore part a kind of double bed place laid over with green leaves, each just sufficient to contain one person. These they told us were to place their dead upon, their chiefs we suppose they meant, otherwise their slain must be very few.

few. Otoo, at our request, ordered some of their troops to go through their exercise on shore. Two parties first began a battle with clubs; they then proceeded to single combat, and exhibited the various methods of fighting with surprising agility; parrying off the blows and pushes with great alertness and dexterity. Their arms are clubs and spears. In using the club, all blows aimed at the legs, were evaded by leaping over it, and those designed for the head, by couching a little, and leaping on one side. The spear, which is used at times as a dart, was parried, by fixing the point of a spear in the ground right before them, holding it in an inclined position, more or less elevated, according as they saw to what part of the body their antagonist intended to make a push, or to throw his dart at; and by moving the hand a little to the right or left, either the one or the other was turned off with great ease. These combatants had no superfluous dress upon them. An unnecessary piece of cloth or two which they had on when they began the combat, were presently torn off by some of the spectators, and given to our gentlemen. This review being over, the fleet departed without any order, as fast as they could be got afloat; and Otoo conducted us to one of his dock-yards, where the two large pahies, or canoes, were building, each of which was an hundred and eight feet long. They were designed to form one joint double canoe, and were almost ready for launching. The king begged of the captain a grappling and rope, to which he added an English jack and pendant, and desired the Pahie might be called the Britannia. This he readily agreed to, and she was immediately so named. When we came to the boat, we found in it a hog, and a turtle of about sixty pounds weight: this had been put in privately by Otoo's order, that the chiefs about him might not be offended by their being deprived of an entertainment. The king would likewise have presented to us a large shark they had prisoner in a creek (some of his fins being cut off to prevent his escaping) but the excellent pork, and fish, with which we were supplied at this isle, had spoiled our palates for such rank food. We were accompanied on board by the king, and Tee, his prime minister, who after dinner took an affectionate farewell. Otoo had importuned us the whole day, and most earnestly requested of us, that we would return to Otaheite. When about to depart, he desired of the captain to permit a youth, whom he took by the hand, to go in the ship to Amsterdam, in order to collect for him red feathers. The youth was very desirous of going, but as he could not return, the captain, with the view of satisfying Otoo, promised him, that if any ship should be sent hither from Britain, the important article of red feathers should not be forgotten. The captain, we believe, was disposed to have obliged the king; but it is to be remembered, we had resolved to carry no one from the isles (except Oedidee, if he chose to go) and the captain had just refused Mr. Forster the liberty of taking a boy with him, for reasons already mentioned. But if curiosity excited a desire in the youth of Otaheite to go with us, the treatment we had met with at this place had induced one of our gunner's mates to remain at it. To this end he had formed a plan, which he knew was not to be executed with success while we lay in the bay; and no sooner were we out, the sails set, and the boats out, than he took the opportunity, being a good swimmer, to slip overboard. He was discovered before he had got clear of the ship, and a boat being hoisted out, presently returned with the runaway. About midway between us and the shore, a canoe was observed coming after us, intended without doubt to take him up; for when the people in her saw our boat, they stood off at a greater distance. This we found was a preconcerted plan between the man and some of the natives, with which Otoo was acquainted, and had encouraged. The gunner's mate was an Irishman by birth, and we had picked him up at Batavia, in our first voyage. He had neither friends, nor connexions, to confine him to any particular part of the world, where then could he be so happy as at one of

these isles? Here he might enjoy in ease and plenty, not only the necessaries, but the luxuries of life, which leads us, before we leave this celebrated island of Otaheite, to give some account of its present state, especially as it differs much from what it was even eight months ago; and in order to give our subscribers, and numerous readers a more distant idea of its situation, general figure, extent, and the character of its inhabitants, we must beg of them to indulge us with the liberty of a recapitulation of several things, which have already appeared in detached parts of this work; that so the whole may be brought into one view, and its distinct heads ranged in their proper order. We have already mentioned the improvements we found in the plains of Oparree and Matavai. The same was observed in every other part that came under our observation. It seemed to us almost incredible, that so many large canoes and houses could be built in so short a space as eight months; but the iron tools which they had got from the English, and other nations, who have lately touched at the island, no doubt, had accelerated the work, and of hands they cannot be in want. The great increase in the number of their hogs no less excited our admiration; though, probably, they were not so scarce when we were here before, as we then imagined; as, not chusing to part with any, they might have conveyed them out of sight.

The situation of this isle is perhaps the best in the world, being exposed to none of those vicissitudes of heat and cold, which are observed to have so sensible an effect on the health and spirits of those who live in remoter regions. Its exact position is from latitude 17 deg. 28 min. to that of 17 deg. 53 min. S. and from longitude 149 deg. 10 min. to 149 deg. 40 min. W. It lies nearly N. W. and S. E. and is divided into two distinct principalities by an isthmus, or neck of land, and three miles over. The north-westerly division is, however, much larger, and more fertile, but by no means so well cultivated as the south-easterly division; which shews, that even the defects of nature, if we may be allowed to call them so, have their use, in prompting men to industry and art, to supply their wants. The figure of the largest peninsula, is nearly circular, being from N. to S. about twenty miles, and from E. to west. about the same. The whole is surrounded with a reef of rocks. The lesser peninsula is rather of an oval form, and from the neck of land on the N. W. side, to the little isle of Otooareite on the S. E. is about twelve miles; but from the mouth of the river Omatea on the south, to that of Owahe on the north, not more than eight. The circumference of the largest peninsula is about sixty miles, of the smallest about twenty-four; but in sailing round both, the line will be extended to ninety nearly.

For a particular account of the produce of the island, we are indebted no doubt to the indefatigable industry of Mr. Banks and Dr. Solander; in whose catalogue are the following particulars, namely, bread-fruit, co-coa-nuts, bananas of thirteen sorts; plantains, a fruit not unlike an apple, which when ripe is very pleasant; sweet potatoes, yams, cocoas, a kind of arum; a fruit called by the natives jambu, very delicious; sugarcane; a root of the faloop kind, called pea; a plant called ethee; a fruit named ahee, not unlike a kidney bean, and which, when roasted, tastes like chestnuts; a tree called wharra, producing a fruit not unlike a pine apple; a shrub called nono; the morinda, which also produces fruit; a species of fern; and a plant called ava, of which the roots only are chewed: all these, which serve the natives for food, the earth produces spontaneously; besides which there are a great variety of shrubs and plants, which serve for various purposes of building houses, vessels, tools of different kinds, manufactures, dyes, &c. to enumerate which would be tedious. Of four footed animals the island produces but few, none having been seen by the Europeans on their first landing, but hogs, dogs, and rats, of which last the inhabitants are very fond. Their wild fowl are ducks only, and the birds that haunt the wood, except small birds, are chiefly pigeons, and paroquets;

roquets; but with fish the coast abounds, of which the varieties are numberless. Poultry is not in plenty, nor is it so well flavoured as what we have in Europe. Here it may be proper to observe, that the two goats, which Capt. Furneaux gave to Otoo, when we were last here, seemed to promise fair for answering the end for which they were put on shore. The ewe soon after had two female kids, which were at this time ready to propagate their species; and the old ewe was again with kid. The natives seemed to be very fond of them, and they to like their situation; for they were in exceeding good condition. We may therefore reasonably hope from this circumstance, that, in a few years, they may be spread over all the isles in this ocean. The sheep which we left, died in a short time after; but we understood one was yet alive. We also furnished them with a stock of cats, not less than twenty, besides what we left at Ulitea and Huahine.

The natives, particularly the chiefs, are in size, rather above the largest Europeans. Their food, which is of the simplest kind, is not such as to promote gluttony, nor their drink, which is chiefly water, calculated to provoke intemperance. Their daily intercourse with the ocean accustoms them from their youth to exercise; and the business of fishing, which in northern countries is the most laborious of all employments, is by them practised as their amusement. They who have represented them as indolent, because nature supplies liberally all their wants, have mistaken their character. Even their chiefs are artists, and their houses, public edifices, canoes, and manufactures, their utensils, instruments of war, working tools, their boats, and fishing tackle, are all proofs incontestible of their industry. Employments of this kind tend to banish sloth; and no person was ever known to languish with an incurable disease among them, though it does not appear, that the medical art has yet made any considerable progress. Much has been said, and in general with strict truth, of the gracefulness of their persons; yet if we were to judge of the whole by Aatorou, and Omia, who were brought to England, they might be thought to have little claim to that perfection; yet their chiefs have undoubtedly a comparative dignity; but that comparison is to be confined at home between prince and peasant, and not extended to European countries, where grace and dignity are leading characters. Their women differ from each other in personal charms as in all other countries; but in stature, those of superior rank take especial care to preserve the family distinction. It is not uncommon for ladies of the first rank to single out a handsome well-proportioned youth, to prevent degeneracy, when the stature of the family is in danger of being reduced; but they are otherwise scrupulous in nothing so much as in mixing with the canaille, and there is scarcely an instance of their cohabiting indiscriminately with the lower class of people. There is, perhaps, no nation where the pride of ancestry is carried to a greater height, and yet they have no means of recording their pedigree, but by oral tradition, nor any rule for continuing the line, but what nature has impressed upon the mother. Having no schools, nothing is to be acquired by education, example is their principal instructor and guide: the pattern set by the father is followed by the son, and what the mother does, that the daughter learns; but this is not to be understood to perpetuate husbandry and arts, as in China, in particular families; for in Otahite husbandry and arts are not imposed as tasks, but are rather amusements to pass away time. None are compelled to work, yet all are employed; their several stations chance seems to have allotted; and here is no murmuring against providence for not being more bountiful. One precaution observed among the great in order to give vigour to their chiefs must not be omitted, and that is, they never suffer an intercourse between the sexes till both parties arrive at full maturity. The very reverse of this is practised by the multitude, who in general are as much below the common standard as their chiefs exceed it. They are almost all tattooed, women as well as men. In this there seems

to be something mystical; the priest performs the operation, and the very children are encouraged by example to endure the pain, than which nothing can be more acute. To have a thousand punctures all at once, with the blood starting at every puncture, is more, one would think, than a child could bear, yet they suffer it with a fortitude of which in Europe an instance cannot be found. Their hair is almost universally black. The men wear it long, waving in ringlets down their shoulders; but the women cut it short round their ears: both sexes suffer none to grow under their arms; and are very delicate in keeping every part about them sweet and clean. To this end they frequently bathe, seldom suffering a day to pass without going into the water more than once. Indeed they anoint their heads with an oil expressed from the cocoa-nut, which sometimes proves rancid, and emits a disagreeable smell; otherwise in their persons they are without a taint. Mr. Banks said, "that if our sailors quarrelled with these people, they would not agree with angels," which sufficiently denotes the goodness of their disposition. We have mentioned that Waheatoua is related to Otoo. The same may be said of the chiefs of Eimeo, Tapamannoo, Huahine, Ulitea, Otaha, Bolabola, for these are all related to the royal family of Otahite. It is a maxim with the Earees, and others of superior rank, as we have just observed, never to intermarry with the Toutous, or others of inferior rank; and probably this custom might give rise to the establishment of the class called Earecoies; it is certain these societies prevent greatly the increase of the superior classes of people, of which they are composed, and do not interfere with the lower or Toutous; for we never heard of one of these being an Earecoy; nor that a Toutou could rise in life above the rank in which he was placed by his birth.

The customs of these people observed in their eating, as our readers must have perceived from what has already been said on this subject, are very singular, and they seem to entertain some superstitious notions, not easily discoverable by strangers. The women are not permitted to eat with the men; not, as it should seem, to mark their inferiority, but in conformity to a custom which habit has established into a law; nor is it usual for any of them to eat in company, except upon certain days of festivity, when great numbers of them assemble together. A messenger from one of our English captains found Oberea, the then supposed queen of the island, entertaining a company, which he supposed could not be less than a thousand. The messes were all brought to her by the servants, who had prepared them; the meat being put into the shells of cocoa-nuts, and the shells into wooden trays; and she distributed them with her own hands to the guests, who were seated in rows. This done she sat down herself upon a seat somewhat elevated above the rest, and two women placing themselves, one on each side, fed her like a child. When she saw the messenger, she ordered a mess for him. They have two ways of dressing their animal food, namely, broiling and baking. The first is performed over hot stones, without any other contrivance than that of placing the meat upon the clean stones, and when done enough on one side, they turn it, and broil the other. Their manner of baking is very singular and curious. They first dig a hole in the ground, in depth and dimensions proportioned to the thing they have to dress; they then place a layer of wood at bottom, and over that a layer of stones; and so alternately a layer of wood and a layer of stones, till the hole is full: the fire is then kindled, and the stones made hot; this done they take out the fire, and placing the stones that are least heated one beside the other at the bottom of the hole, they cover them with fresh leaves; and on these they put the meat intended to be baked; then after laying another layer of green leaves, they fill up the hole with the remaining hot stones, and close the whole with the mould that was first dug out of the pit. In this situation the meat is suffered to remain for three or four hours; and when taken out is then so savoury, as not to be exceeded by the

the best European cookery. Almost all the flesh and fish eaten by the chiefs in the island is dressed in one or the other of the above two ways: the latter is most in use among the gentry; and the former among the commonalty, who sometimes indeed eat their fish without dressing. Tables they have none, and those of the highest quality dine on the ground under the shade of a spreading tree; fresh green leaves serve them for a cloth, and a basket which is set down by them holds their provision; these, and two cocoa-nuts, one filled with salt water, the other with fresh, complete the whole preparation for a meal. When this is done, they wash their hands and mouths, and then, if nothing calls them abroad, they usually lay themselves down to sleep. It was long before any of them could be persuaded to eat with Europeans, and they certainly, like the Jews, have some superstitious ceremonies to be observed in the preparation of the food they eat, which, if omitted, renders it unclean, or they would not have continued scrupulous so long. Even the food of their women is differently prepared from that of the men; and if touched by unhallowed hands, is accounted unfit for use. Some of the gentlemen, when invited to their houses, eat out of the same basket, and drank out of the same cup with their hosts; but it was observed, that the elderly women were always offended with this liberty; and if they happened to touch the victuals of any of the antient matrons, or even the basket that held it, they never failed to express their dislike, and to throw it away; nor could the women of fashion ever be persuaded to eat with the gentlemen, when dining in company: but what seems most strange, and hardly to be accounted for, they would go, five or six in company, into the servants apartments, and eat heartily of whatever they could find; nor did they seem in the least disconcerted, if they were discovered; yet it was not easy to persuade any of them when alone, in private with a gentleman, to eat with him, nor would they ever do it but under the most solemn promises of secrecy.

Their amusements are various, such as music, dancing, wrestling, shooting with the bow, darting their lances, swimming, rowing, and slinging of stones. Their music it must be confessed is very imperfect, consisting only of a flute and drum, yet with these, companies go about the country, and frequent their festivals, being in equal estimation with them as maurice dancers were formerly with us, and the diversion they make is not unsimilar. In shooting the long bow, or in throwing the lance, they by no means excel; neither are they very dexterous at wrestling; but at throwing stones, and swimming, they are perhaps equal to any people upon earth. Among other diversions, they have their heivas, nearly corresponding with our English wakes. The young people meet together to dance and to make merry; and at these times their minstrels and players constantly attend, as formerly persons of the same character were wont to do all over England, and in some counties the vestiges of that antient custom remain to this day. At these heivas, however, their female performers, in their dances, have no regard to decency; and though the same end was no doubt in view in the institution of the wake and heiva, yet what in England was concerted with the utmost secrecy, is publicly avowed and practised in Otaheite. But though the instrumental music of the Otaheiteans is much confined, their vocal music is by no means contemptible; yet in the sweetness of the voice consists all the melody, for they have no rules to regulate the tones. Their songs are accompanied with words of their own composing, which they can vary into long and short verses, sprightly or solemn, as occasion presents; and as their language is exceeding harmonious and musical, a stranger is no less delighted with the arrantest nonsense, than he would be with the most sublime composition. The heivas are indiscriminately frequented by all ranks of people; but there is still a more exceptionable meeting held by those of high rank, to which such only are admitted who are properly initiated. These people form a distinct society, in which

every woman is common to every man; and at their meetings, which are distinguished by the name of *Areoy*, the sports they practise are beyond imagination wanton. We may trace somewhat like this in the history of the antient inhabitants of our own island. Perhaps it would be no exaggeration to add, that in the city of London, there are as many men as the whole island of Otaheite contains, who devote themselves entirely to the pleasures of sensuality, and who attach themselves to no one woman, but enjoy indiscriminately all they may; and that there are an equal number of women to be met with, who are at all times ready to gratify their desires.

Dress, among the ladies of Otaheite, seems to be as much studied, as in more civilized nations. However, neither the feet or legs, even of the quality, have any covering, or any defence from the ground, or the scorching heat of the sun, which at some seasons is very intense: but they are very nice in ornamenting their heads, and in shading their faces. That part of their head-dress, in which they pride themselves most, is threads of human hair, so delicately plaited, that it is not unusual for them to have garlands of this manufacture wound round their heads; the plaits whereof being interwove with flowers have a very pretty effect, and are exceedingly becoming to young faces. In their ears they wear ornaments, which, before the European beads, consisted of bone, tortoiseshell, or any thing shining and shewy. The other part of their dress is very simple; being a piece of cloth about a yard and a half wide, and between three and four yards long, having a hole cut in the middle, just big enough to let the head pass easily through; this flows round them, and covers them a little below the waist; from thence a large quantity of the same cloth is gathered in folds, and tied round them as we tie a cravat round the neck, which, being drawn into a large knot, is again spread out, and flows artlessly down before, nearly as low as the knees, while the greatest quantity of the cloth falls down behind, in appearance not unlike the dress of the Roman orators. This habit is far from being ungraceful, and there is little difference between that of the sexes, except that the lower garments of the men are nearly of an equal length before and behind. The cloth they wear is of very different textures. What is worn in dry weather is no other than paper made of the rinds of trees; but that which they put on when it rains is more substantial, and is properly a kind of matting incomparably plaited. The shape of their cloathing, like that of our own, is nearly the same from the prince to the peasant, the only distinctions being the quantity worn, and the colour; the lower class of people wearing only one single garment; the better sort as many as, were they made of broad cloth, would burden them to carry. One thing, however, appears singular. When they salute each other, they constantly unbare themselves from the waist upwards, throwing off their tunics, as we may call them, with the same ease, and for the same purpose, as we pull off our hats. This salutation is common to the women as well as the men, and is the universal practice. We have occasionally mentioned how fond the people of Otaheite are of red feathers, which they call *Oora*; and these are as highly valued here as jewels are in Europe; especially what they call *Oravine*, which grow on the head of the green paroquet; and though all red feathers please, none are esteemed equally with these. They are such good judges as to know very well how to distinguish one sort from another; and many of our people attempted in vain to deceive them with other feathers dyed red. These ornaments of dress are made up in little bunches, consisting of eight or ten, and fixed to the end of a small cord about three or four inches long, which is made of the outside fibres of the cocoa-nut, twisted so hard that it is like a wire, and serves as a handle to the bunch. When composed in this manner, they are used as symbols of the *Eatuas*, or divinities, in all their religious ceremonies. Sometimes they hold one of these bunches, and at others, only two or three feathers between the fore-finger and thumb,

thumb, and say a prayer, not one word of which we could understand. Whoever makes a voyage to this island, will do well to provide himself with red feathers, the finest and smallest that are to be got. He must also have a good stock of axes and hatchets, spike-nails, files, knives, looking-glasses, beads, and especially sheets and shirts, which our gentlemen found the ladies very desirous of having.

The arts in the island of Otaheite may be reduced to five, namely, architecture, carving, ship-building, navigation, and painting. Of their architecture there is one remarkable specimen existing in the greater island, which is the Morai, or sepulchral monument of Oberea. It is a prodigious pile of stone 267 feet long, and 87 wide at the base, raised by flights of steps to the height of 44 feet. These steps are each four feet high, narrowing gradually, till they end in a small entablature, on which near the middle stands the figure of a bird carved in wood; and at some distance the broken fragments of a fish cut in stone. This pile makes a considerable part of one side of a square court, whose area is 360 feet by 354, inclosed within a stone wall, and paved with the same materials through its whole extent. As this square is surrounded with trees, and has many growing within it of a particular kind, it forms at a distance the most delightful grove that imagination can paint. At what time it was erected could not be learnt, for they have no records of past transactions; but being constructed of coral stones, many of large dimensions, neatly squared and polished, and so nicely joined as hardly to discover a seam, it must fill the mind of a nice observer with admiration and rapture, while he examines all its parts. To think how such a mass of materials could be brought together in an island wherein no quarries are to be found; how these materials could be cut with such exactness, as to form a pile by rain, without cement, and that with tools little harder than the substance to which they were applied; and, lastly, how these enormous blocks of stone could afterwards be raised to the height of 44 feet, to clofe and cover in the building, must surely excite the wonder of every ordinary beholder; but to mark the symmetry of the whole, so justly proportioned in every part, as to display the most consummate judgment, must afford a feast to an enlightened mind, of which an ordinary seaman can have no relish. This noble structure, and strong proof of genius, will remain the admiration of all who may have the pleasure of seeing it, perhaps, as long as the island itself shall endure; for being solid, and without a cavity, no time, that will not equally affect the island, can destroy it. Of their carving in stone there are but very few specimens to be produced, and indeed, when their tools they have to work with are considered, it is more to be admired, that there are any, than that there are so few; but we have reason to hope, that now they are made acquainted with the use of iron, and have considerable quantities of that metal among them, that their improvements will speedily be proportioned to their advantages, and the acuteness of their understanding. But of their carving in wood, we saw not a tool, or ordinary utensil, that did not discover evident proofs of their expertness in this art. Their vessels for navigation are all adorned with it; and in some of their performances an excellence is discernable, which, with such tools as they have to work with, no European carver could exceed. With regard to their ship-building, they are upon a footing with their neighbours, if not at present superior to them. Their ordinary vessels are well adapted to the seas they have to navigate, and we never heard of a single instance of one of them being cast away. Most of them are elevated at the head and stern, for the purpose of defending the rowers from the surf, which on these islands breaks upon the shore with uncommon violence. Those of Otaheite are in form not unlike the punt boats, with flat bottoms, such as are used by our fishermen on the river Thames, or rather like those used for the same purpose on the Severn: they are no where wider than three feet, though some of them are more than 60 feet long; nor are they an

inch deeper in the body, though at the head and stern they rise with a curvature more than 12 feet. As it would be impossible to navigate these vessels, so long, and so narrow, without some contrivance to keep them upright, they place two of them as near as can be of the same dimensions, along-side of each other, at three, four, or five feet distance, and with strong spars join them together; then raising a mast in each, they hoist a square sail, the yards of which are fastened above and below to the corresponding masts, and thus equipt, with a cabin erected between them to stow their provisions, they will keep the sea for several days. In rigging their double canoes, they have a rule for proportioning the height of the masts to the length of the keel, and of fitting the sail to the height of the mast; they likewise have a contrivance of sailing in single canoes by means of out-riggers, which project on the lee-side of the vessel, and prevents their over-setting: to this out-rigger one corner of the sail is made fast, which sail being wide at the bottom, and rounding to a point at the top, very much resembles what the boatmen call a shoulder of mutton sail, frequently seen on the river Thames. To those who have been told, that the mason can joint with so much nicety as to be impervious to water, it will not seem strange that their carpenters can do the same with respect to timber; yet it certainly must require much art, and incredible labour, first to fell the tree, then to cleave it out into planks, then to hollow it out into the intended shape; next to smooth and polish it, after that to joint it, and last of all to put it together, and saw it; for they were wholly ignorant of the art of bolting it with wooden bolts, or jointing it together by means of mortices, till the Europeans visited them. It is no wonder, therefore, that they dreaded nothing so much as the destruction of their boats, when threatened by the English for any offence, nor that they should be more careful in covering their boat-houses from the sun and rain, than they are in securing their dwellings from the same injury. As the whole art of navigation depends upon their minutely observing the motions of the heavenly bodies, it is astonishing with what exactness their navigators can describe the motions, and changes of those luminaries. There was not a star in the hemisphere, fixed, or erratic, but Tupia could give a name to, tell when, and where, it would appear, and disappear; and, what was still more wonderful, he could tell, from the aspect of the heavens, the changes of the wind, and the alterations of the weather, several days before they happened. By this intelligence he had been enabled to visit most of the islands for many degrees round that of which he was a native. By the sun they steer in the day, and by the stars in the night; and by their skill in presaging the weather, they can, without danger, lengthen or shorten their voyage as appearances are for or against them. Having no medium wherewith to trade, their voyages seem wholly calculated for discovery, or to increase their acquaintance with other nations. Riches they do not seem solicitous to acquire. They certainly interchange their commodities among themselves, as well as with strangers; the fisherman barter his fish for the planter's bread-fruit, and so of the rest; yet every man seems to be a fisherman, and every man a planter: this shews, that we are still strangers to their civil œconomy. It had been good policy to have suffered two or three young persons, who were desirous of staying behind, to have settled among them, especially, as there was reason to believe, that the island would again be visited, if for no other reason than to restore to them the native who had voluntarily undertaken a voyage to Europe; but against this Capt. Cook seems to have been carefully guarded. With respect to the art of painting among these people, to us it appeared to be in a rude state, being chiefly confined to the figures represented on their bodies, and the ornaments on their canoes. The figures on their bodies are generally those of birds and fishes, sometimes after nature, and sometimes the effusions of fancy; but whatever is represented, the outline is traced with surprising exactness. This art is solely confined to the

priesthood, and is performed like baptism as a rite, without which, after a certain age, none are accounted worthy of society. From twelve to fourteen is the period allotted for the performance of this rite, for before that age children are thought unable to endure the smart. The other sort of painting in use among these islanders may be rather called daubing, consisting only in colouring the rude carvings in their pleasure boats, &c. sometimes with one colour, sometimes with another, but most commonly with red. We shall close this head with a few remarks on their marine force, or war canoes, considered as their grand fleet. Capt. Cook when last at Otaheite conceived rather an unfavourable opinion of Otoo's capacity and talents; but the rapid improvements since made in the island convinced us, that he must be a man of good parts; and it is certain that he has some judicious, sensible men about him, who have a great share in the government; but we cannot say how far his power extends as king, nor how far he can command the assistance of the other chiefs, or is controulable by them: this however is certain, that all have contributed towards bringing the isle to its present flourishing state: yet we found it not without divisions among their great men. The king told us, that Towha, the admiral, and Poatatau, were not his friends. These being two leading chiefs, Otoo must have been jealous of them on account of their great power; yet on every occasion he seemed to court their interest. We are inclined to think they raised by far the greatest number of vessels and men, to go against Eimeo, and were to be the two commanders in the expedition, which, according to common report, was to take place five days after our departure. Waheatoua, king of Tiarabou, was to join this fleet to that of Otoo, and that young prince was to be one of the commanders. One would think so small an island as Eimeo, would have endeavoured to settle matters by negotiation rather than resist the united force of those two powerful nations; yet nothing was heard or talked of but fighting. Towha said more than once, that he should die in the action. Oedidee thought the battle would be fought at sea; but we thought it most probable, that the people of Eimeo would remain at home on the defensive, as we were informed they did about five or six years ago, when attacked by the people of Tiarabou, whom they repulsed. We were told, that five general officers were to command in this expedition, of which number Otoo was one; and, if they named them in order according to the posts they held, Otoo was only the third in command; which seems probable enough; for he being but a young man he could not have sufficient experience to be commander in chief, where the greatest skill and judgment seemed to be necessary. Capt. Cook was disposed to have staid five or six days longer, had he been sure the expedition would have taken place in that time, but it seemed they wanted us to be gone first. It was sometimes reported, that it would not be undertaken before ten moons; as if it was necessary to have that time to put every thing in order. For several days before we sailed, Otoo and the other chiefs had ceased to solicit our alliance and assistance, which they were continually doing at first; and after Capt. Cook had assured Otoo, that if they got their fleet ready in time he would sail with them down to Eimeo, we heard no more of it. Probably they thought it more political to be without us, knowing it was in our power to bestow the victory on whom we pleased. Be this as it may, they undoubtedly wanted us to be gone before they undertook any thing; and thus we were deprived, much against our inclination, of seeing the whole fleet assembled on this occasion, and, perhaps of being spectators of a well conducted engagement at sea. What number of vessels were appointed for this grand expedition we could not learn. We heard of no more than two hundred and ten, besides a number of small canoes for transports, and the allied fleet of Tiarabou, the strength of which we could not gain the least intelligence: nor could we learn the number of men necessary to man this fleet. Whenever the question was asked, the answer was Warou, warou,

warou te Tata, that is many, many, men. Allowing forty to each war canoe, and four to each of the others, which is a moderate computation, and the number will amount to nine thousand; an astonishing number, if we consider they were to be raised in only four districts, and one of them, namely, Matavai, did not equip a fourth part of the fleet. That of Tiarabou is not included in this account; and many other districts might be arming which we knew nothing of; yet we think the whole island of Otaheite did not arm on this occasion, for we saw not any preparations making at Oparree. We believe that the chief, or chiefs, of each district, superintended the equipping of the fleet belonging to that district; after which they must pass in review before the king, who by this means knows the state of the whole intended to go on service. The number of war canoes belonging to Attahourou and Ahopata is an hundred and sixty; to Tettaha forty; to Matavai ten; now if we suppose every district in the island, of which there are forty-three, to raise and equip the same number of war canoes as Tettaha, according to this estimate, the whole island can raise and equip one thousand seven hundred and twenty war canoes, and sixty-eight thousand able men, allowing forty to each canoe; and seeing these cannot amount to above one third part of the number of both sexes, children included, the whole island cannot contain less than two hundred and four thousand inhabitants. This at first sight exceeded our belief; but when, upon a review of this calculation, we considered the vast swarms of natives which appeared wherever we went, we were convinced our estimate was not much, if at all too great. There cannot, in our opinion, be a stronger proof of the richness and fertility of Otaheite (not forty leagues, or 120 miles, in circuit) than that of its supporting such a number of warriors and warlike inhabitants, all artists, and possessed of a fleet both their glory and defence. Such is the present state of the arts in this celebrated island, which, had Tupia lived to have come to England, and to have returned again to his own country, would, no doubt, have received still more rapid improvements; for he was a man of real genius, a priest of the first order, and an excellent artist. His boy Tayota was the darling of the Endeavour's crew, being of a mild and docile disposition, ready to do any kind office for the meanest in the ship; never complaining, but always pleased. They both died much lamented at Batavia, the occasion of which has been related in its proper place.

The manufactures of Otaheite are of various kinds; that of cloth is in the highest estimation among them. The material of which one sort is made is neither spun, nor woven in a loom, but in every respect is prepared after the first simple manner of making paper before mills were applied to facilitate the labour. The bark is first stripped from the tree and laid in the water, as we do flax, to soak: it is then divested of the rind by scraping, till only the fibres of the inside remain. When properly cleansed, it is placed upon leaves, one layer by the side of another, till it is of sufficient breadth; and in the same manner it is extended to what length the manufacturer chuses, or the ground will admit; and to strengthen it and increase its breadth, one layer is laid over another till it is of the substance required. This done, it is left to drain, and when just dry enough to be raised from the ground, it is placed upon a kind of stage, made of smooth boards, and beat with a square beater about a foot long, and two or three inches broad. On each of the four sides of this beater parallel lines are cut lengthwise: these lines differ in fineness, in a proportion from small twine to a silken thread. They first begin with the coarsest side of the beater, and finish with the finest. By the continual application of this beater, in which two people are continually employed, who stand opposite to each other, on each side of the stage, and regulate their strokes like smiths on an anvil, the cloth, if cloth it may be called, in its rough state thins apace, and as it thins, it of course increases in breadth. When it has undergone this process, it is then spread out to whiten,

whiten, which when sufficiently done, it is delivered to the ladies, whose province is to look it carefully over, and to remove all blemishes. Thus far completed, it is coloured, generally red or yellow, after which it is rolled and laid up for use. By this process the reader will readily comprehend in what manner the fabric may be varied into fine or coarse, according to the materials of which it is made, and the labour bestowed upon it. In Otaheite the bark of three different trees is made use of in this manufacture; the Chinese paper mulberry, the bread-fruit tree, and the wild fig-tree. Of the first and second the finest forts are made; but of the last, the most durable. The first and second imbibe water like paper; but the latter will resist the rain. They have a method of washing this cloth, after it has been worn, and when washed it is again beaten; by this last process it is rendered very soft and pliable. Another considerable manufacture is that of matting, made likewise of the rinds of plants and shrubs, which are worked to a degree of fineness not to be equalled by any thing of the kind known in Europe. Of this manufacture are made their sails, the covering of their beds, and their cloathing in rainy weather. Their cordage is another considerable article, which is made of the rind of a plant not unlike a wild nettle. In this manufacture they likewise excel, but we do not learn that any of it was purchased for the ship's use. Their lines made for fishing are much superior to any thing of the kind used in Europe, being stronger and infinitely more durable. Their fishing nets have the same advantages; but the cords made of human hair, which the ladies wind round their heads, and which, like netting, is the chief amusement of the ladies there, is incomparably beyond any thing that can be conceived in twisting. Mr. Banks is said to have had in his possession a specimen of it, near two thousand yards in length, and as fine as our finest thread, not having one knot, or apparent joining, neither have they any engine to assist them in the performance, but all is done by the hand, and with a quickness that almost exceeds belief. They have likewise a manufacture of basket, or wicker work, of which every native is a proficient; and as they have a kind of emulation in excelling in this kind of work, it is not to be wondered at, that there should be as many different forms, as there are different makers, some of them incomparably neat. But among the curiosities of this kind, that which was most admired by the Endeavour's people, when at this isle, was the figure of a man upwards of seven feet high, represented in basket work, which they imagined was a representation of one of their deities. This wicker skeleton was completely covered with feathers, white where the skin was to appear, and black in those parts which it is their custom to paint or stain, and upon the head, where there was to be a representation of hair. Upon the head were four protuberances, three in front, and one behind, which the natives called Tate-ete, or little men. Other manufactures of less account, yet not unworthy of notice, are their weapons of war, which seem to be the workmanship of the owners, their fishing tackle of various sorts, their working tools, and their jewelry; but in this last it cannot be expected, considering their tools, they should have any scope to display or exercise their ingenuity.

We come now to speak of their civil government, of which we have it not in our power to give our readers a distinct and perfect idea. This island of Otaheite made formerly but one kingdom; how long it has been divided into two we cannot pretend to say, we believe not long. The kings of Tiarabou, are a branch of the family of Oporouou; at present the two are nearly related, and we believe the former is, in some measure, dependent on the latter. Otoo is styled Earee de hie of the whole island; and we were told, that Waheatoa, the king of Tiarabou, must uncover before him, in the same manner as the lowest order of his subjects do. This homage is not only paid to Otoo, but to Tarevatoa, his brother, and his second sister, to the one as heir, and to the other as heir apparent. We have sometimes seen the Eowas and Whannos covered

before the king, but whether by courtesy or by virtue of their office, we could not learn. These men, who are the principal persons about the king, and form his court, are generally, if not always his relations. Tee, so often mentioned in this narrative, was one of them. The Eowas, who hold the first rank, attend in turns, a certain number each day, so that they may be called lords in waiting. We seldom found Tee absent, and his attendance was necessary, as being best able to negotiate matters between Capt. Cook and the chiefs; on this service he was always employed, and he executed the same, we have reason to believe, to the satisfaction of both parties. The Eowas and Whannos always eat with the king; nor do we know of any one being excluded from this privilege, but the Toutous; for as to the women, as we have already observed, they never eat with the men, let their rank be ever so much elevated. Notwithstanding these established orders, there was very little about Otoo's person or court, whereby a stranger could distinguish the king from the subject. We rarely saw him dressed in any thing but a common piece of cloth wrapped round his loins; so that he seemed to avoid all outward pomp, and even to demean himself more than any of his Earees around him. We have seen his majesty work at a paddle, in coming to and going from the ship, in common with others in the boat; and even when some of his Toutous sat looking on; and such is the uncontrouled liberty of this happy isle, that every individual has free access to him without the least ceremony; hence it is, that the Earees and other chiefs are more beloved than feared by the bulk of the people. We should think ourselves happy in knowing more of this mild and equal government, than the general outline; for as to the orders of the constituent parts, how constructed, disposed, and connected, so as to form one body politic, we can say but little. From what we have been able to discover, and gather from information, it seems very evidently to be of the feudal kind; and a remarkable conformity appears between the political establishment of Otaheite, and that of the antient Britons, which consisted of several small nations, under several petty princes, or chiefs, who in cases of common danger united under one head. These chiefs had all of them their respective families, who multiplying, became a distinct class from the common people, and preserved by their personal courage, and lenity, a very great influence over them. Of these two classes, added to that of the priesthood, the whole body politic consisted; so that among them, what one class found necessary to command, the other was ready to execute. Hence it was that industry took place, and arts were invented; and this seems to be the present state of the islanders of whom we are now speaking. Laws they had none, but such as arose from the idea of superiority and subordination, such as excite parents to correct the faults of their children; neither have the Otaheiteans any other at this day. There is no crime among them that subjects a man to death, and when life is taken away, it is always in the heat of passion or resentment, and not the effect of formal accusation and deliberate punishment. The contentions that arose among the chiefs became the quarrels of the whole community, and those quarrels necessarily led the parties to have recourse to arms, and in proportion as the contentions grew more frequent, the weapons that were contrived for defence, grew more desperate. It was not, however, till after civilization took place, that contentions for liberty began to spread devastation among people of the same community. In their primary state of subjection, the people never entertained a thought that they were in slavery: they obeyed as children do their parents, from a principle originating in nature, which induces the weak to submit to the strong, and those of uninformed understanding to be governed by those whose wisdom and courage they readily acknowledge. This, in our opinion, is an impartial and just representation of the state of the civil government in Otaheite, wherein none think themselves slaves, yet few are free.

As to the religion of this people, we are as much at a loss

loss for materials to form an opinion on this subject as former navigators. The little information we have hitherto received is so vague and contradictory, that nothing with certainty can be said about it. We have said they have idols, yet they appear not to be idolaters; that they have places of worship, yet never assemble in congregations to pay adoration; that they acknowledge deities of several orders, but that they have no forms of addressing them; and that they mutter somewhat like extemporary prayers, yet have no oratories, or forms of devotion, nor any set times for private or public worship. They have priests likewise of several orders, who have different offices assigned; but few of those offices are particularized, except that they preside and pray at funerals, and are the principal attendants at their Morais, or burying places; though it does not appear that any ceremonies of devotion are performed there. The offices that have been observed as appertaining to the priesthood are three, namely, circumcising, tattowing, and praying at the funerals of the dead. That of circumcising is not performed after the manner of the Jews, but after a peculiar manner of their own, and has no doubt the purity of the circumcised for its object, in bringing every part about them into contact with the water, with which they constantly wash three times every day. Tattowing, whatever its object, is never omitted; and praying for the dead is a proof that they believe in the soul's existing in a separate state, after death, which is confirmed by their placing meat and drink in their burying places. In this custom, they are far from being singular. Among the ancient Romans, in the infancy of their state, they placed meat upon the tombs of their deceased friends, that the ghosts might come out and eat, as they believed they would; and when they intended to express the most abject state of human wretchedness, they used to say, "such a creature gets his food from the tombs." The character of the Tahowa in Otaheite, very nearly corresponds with that of Druid among the ancient Britons. He is the chief priest, and his erudition consists in learning the several traditional memorials of ancient times; in being made acquainted with the opinion of their ancestors, concerning the origin of things; and in the repetition of short mysterious sentences, in a language which none but those of their own orders can understand. The Bramins of the east have their mystic, unknown tongue, as have also all the followers of the great Zoroaster. The priests are superior also to the rest of the people in the knowledge of navigation and astronomy, and in all the liberal arts, of which these people have any idea. Thus far the character of the Tahowa agrees with that of Druid, in every particular. The Druids were the only persons of any sort of learning, which consisted in the observation of the heavens, knowledge of the stars, whereby they presaged future events; they had the care of all religious matters, and their authority was absolute. The chief of the Druids, was pontiff or high priest, whose dignity was elective. Thus we might trace the conformity of the customs and manners of nations remote from each other, in their infant state, but we waive such an enquiry, as it might be thought foreign to our business in hand.

We shall conclude this historical sketch of Otaheite with a brief account of their funeral ceremonies, in which the priest and the people jointly assist. When a native is known to be dead, the house is filled with relations, who deplore their loss, some by loud lamentations, and some by less clamorous, but more genuine expressions of grief. Those who are the nearest degree of kindred, and most affected by the event, are silent; the rest are one moment uttering passionate expressions, or exclamations in a chorus, and the next laughing and talking, without the least appearance of concern, much like the manner of the wild Irish; but this solemnity is continued for a day and a night, whereas by the Irish it is continued several nights. On the next morning the body is shrouded, and conveyed to the sea side on a bier, upon the shoulders of the bearers, and attended by the priest, who having prayed

over the body, repeats his sentences during the procession. When they arrive at the waters edge, it is set down on the beach; the priest renews his prayers, and taking up some of the water in his hand, sprinkles it towards the body, but not upon it. It is then carried back forty or fifty yards, and soon after brought again to the beach, where the prayers and sprinkling are repeated. It is thus removed backwards and forwards several times; and during the performance of this ceremony, a house has been built, and a small piece of ground railed round, in the centre of which a stage is erected whereon they place the bier, and the body is left to putrify, till the flesh is wasted from the bones. As soon as the body is deposited in the Morai, the mourning is renewed. The women now assemble, and are led to the door by the nearest relation, who strikes a shark's tooth several times into the crown of her head: the blood copiously follows, and is carefully received upon pieces of cloth, or linen, which are thrown under the bier. The rest of the women follow this example, and the ceremony is repeated at the interval of two or three days, as long as the zeal and sorrow of the parties hold out. The tears also which are shed upon this occasion are received upon pieces of cloth, and offered as oblations to the dead. Some of the younger people cut off their hair, which is likewise thrown under the bier. This custom is founded on the notion, as some of our gentlemen thought, that the soul of the deceased is hovering about the place where the body is deposited; that it observes the actions of the survivors, and is gratified by such testimonies of their affection and grief; but whether this is part of the natives faith is very problematical; neither, in our opinion, is it certain, that the priest is an attendant in the funeral procession down to the waters edge; for in the funerals at which Mr. Banks was a party, no mention is made of a priest; and Tuberaï Tumaiide, who was chief mourner, performed the whole of the funeral service. The natives are all said to fly before these processions, and the reason assigned is, because the chief mourner carries in his hand a long flat stick, the edge of which is set with sharks, and in a phrensy, which his grief is supposed to have inspired, he runs at all he sees, and if any of them happen to be overtaken, he strikes them most unmercifully with his indented cudgel, which cannot fail to wound them in a most dangerous manner; but this reason, though a plausible one, does not, in our judgment, seem to come up to what is said in the course of the relation, by the compiler of Capt. Cook's voyage, who tells us, that while the corpse is carrying in procession, the people every where fly and hide themselves in the woods, and that none but those immediately concerned in it, if they can avoid it, come in sight. Were it only for fear of the cudgel that these people fled, they needed not run so far as the woods, nor to quit their houses. (as Mr. Banks observed they did when the corpse of an old woman, whose funeral he attended, came by in procession) to hide themselves in holes; it would have been sufficient for them to have kept out of the reach of the cudgel; but they must be awed by some secret motive; some superstitious dread of some misfortune happening to them, should they meet the corpse, either in an unlucky place, or in an ominous situation; as at this day many people in the northern parts of Britain get out of the way of a corpse when carrying to the grave, for these or the like reasons. The people of Otaheite, we think, are not intimidated by the apprehension of being beaten; but they may have a dread upon them of they know not what; yet it is such a dread as insensibly impels them to keep at a distance, and if they are by accident surprized, and meet a corpse at the corner of a street, or the rounding of a hill, they never fail to bless themselves, and turn the way the corpse is carrying, and walk in the same direction for several paces to avert the bad effects of the unlucky omen, which they always interpret against themselves. In an account of the funeral ceremonies of the islanders in the South Seas, the writer, who judged from what he himself saw, and not from what

was reported to him, tells us, that the priest, accompanied with two boys painted black, attend the Morai, or place where the corpse is deposited, to receive the hogs, fish, and other provisions, which on these occasions are offered to the Ethooa, or deity of the place, and to lay them upon an altar. This priest is also employed in strewing over the body of the defunct leaves, and flowers of bamboo; and for two or three days he occasionally ranges the adjacent fields and woods, from which every one retires on his approach. The relations, in the mean time, build a temporary house near the Morai, where they assemble, and the females mourn for the deceased, by singing songs of grief, howling, and wounding their bodies in different places with sharks teeth; after which they bathe their wounds in the next river or sea, and again return to howl and cut themselves, which they continue for three days. After the body is corrupted, and the bones are become bare, the skeleton is deposited in a sort of stone-pyramid built for that purpose. These Morais are frequented by two birds sacred to their gods, namely, the grey heron, and a blue and brown King-fisher; but whether these birds, or the priest and his attendants eat the offerings that are made to the presiding deity, or whether they are eaten at all, we are not informed, though we have spared no pains in making enquiries among our friends and fellow voyagers, concerning this and several other doubtful and questionable particulars. It is agreed, however, that the piety of the natives is in no instance so strongly expressed as in the profusion of covering they bestow upon the remains of their deceased friends, and in the ornaments with which they decorate their Morais, but these Morais are not the receptacles of the ordinary dead, but appropriated solely to the use of the principal families to which each respectfully belongs: how it fares with the bodies of the common herd we could not learn, whether they are suffered to rot upon the ground, or under it; nor have our principals afforded us information concerning this particular; indeed they seem to have been most intent upon what is striking in high life, without regarding the ordinary occurrences that daily pass among the multitude; these did not much attract their notice. We shall just add to what has been said under this head, that the Otaheiteans have neither physicians or surgeons, by profession, except the priest, whose relief consists in prayers and ceremonies, not in drugs or prescriptions; yet we must not conclude from hence, that they are deficient in the art of healing. Two or three instances occur in the relations of different voyagers, which, to say no more, are striking proofs of their knowledge in what is necessary to preserve life. Tupia was pierced through the body with a lance, headed with the jagged bone of the sting-ray: the weapon went in at his back, and came out just under his breast; yet he was perfectly cured, and never complained of any bad effects of his wound. One man had his head almost crushed, his face beat in, his nose flattened, and one eye beat out, the hollow of which would almost admit one's fist; yet this man, we are told, was cured, and to all appearance felt no remaining pain. A third had a stone through his head with a sling, in the time of action, and yet, strange and improbable as it may seem, he, like the others, we are informed, appeared to enjoy a good state of health. We will not vouch for the truth of all the circumstances in these relations, which we think are rather of the marvellous kind, yet we may be allowed to infer from the facts themselves, that they are incontestible proofs, that the natives of Otaheite have a knowledge of the virtues of balsams, of which we are either not possessed, or are ignorant of their healing qualities. From this narrative of the island of Otaheite and its inhabitants, some will be ready to envy them their felicity; but it must be remembered as a foil to this, that they do not always sleep in security: they are frequently surprized by their warlike neighbours, and whole districts are depopulated; for it in the invasions of one another's territories, they happen to prove successful, the victors spare neither man, woman, nor child. But it is time now

to return to the ship, which on the 14th of May we left under sail, and that night she cleared the reef.

On Sunday the 15th, we had an open sea, with a fine breeze in our favour, and pursued our voyage to the N. W. and N. W. by W. The same night we made the island of Huaheine, and anchored in the north entrance of O'Whare harbour. Oree, the chief, and several of the natives paid us visits. Oree, among other articles, brought with him a hog; and the next day, being the 16th, Capt. Cook returned Oree's visit, presenting to him some red feathers, which he held in his hand, and muttered over them a prayer. This morning the people began to bring us fruit. The chief sent us two hogs, which were followed by himself and friends who came to dine with us. Oree asked for axes and nails, which were readily given him. These he distributed as he pleased, but bestowed the largest share upon a youth who appeared to be his grandson. After the distribution was over they all returned ashore. Mr. Forster, and a party with him, went up the country to examine its productions; which he continued as a daily task during the ship's continuance in this harbour. As a servant of Mr. Forster's was walking along the shore, without a companion, he was beset by several stout fellows, who would have stripped him, had not some of our people arrived to his assistance. One of the men made off with a hatchet. This day the number of natives that came about the ship was so great, that it was found necessary to place sentinels in the gangways, to prevent the men from coming on board; but no opposition was made to the women, so that the ship was crowded with them.

On Tuesday, the 17th, we found Oree, and a great number of the principal people assembled in a house consulting together. We heard the late robbery mentioned by them several times; but the chief assured us, neither himself nor his friends had any hand in the same, and desired Capt. Cook to kill with his guns those that had. We could not learn where the robbers were gone, and therefore, at present, took no more notice of the affair. In the evening a dramatic entertainment was exhibited. The subject of the piece was that of a girl running away with us from Otaheite. This was not wholly a fiction, for a girl had taken her passage with us from Ulitea, and was at this time present when her own adventures were represented: she could hardly refrain from tears while the play was acting; and it was with much difficulty we persuaded her to stay out the entertainment. At the conclusion of the piece, the girl's return to her friends was represented; and the reception she met with was not a favourable one. It is very probable that this part of the comedy was designed to deter others from going away with us.

On Wednesday, the 18th, King Oree came and dined on board, and the Captain, at his desire, ordered the great guns to be shotted, and fired into the water, by way of salute at his arrival and departure: indeed he had by Oedidee given us to understand, that he expected the same honours to be paid to him, as had been shewn to the chiefs of Otaheite. A party of petty officers having obtained leave to amuse themselves in the country, they took with them some hatchets, nails, &c. in bags, which were carried by two natives, who went with them as their guides, to shew the way. These fellows made off with the trust reposed in them, and artfully enough effected their escape. The party had with them two musquets; and after it had rained some time, the natives pointed out some birds for them to shoot. One of the guns went off, and the other missed fire several times. At this instant, when the fellows saw themselves secure from both, they took the opportunity to run away, and not one of the party, being all much surprized, had presence of mind enough to pursue them. On the 19th a report was current, that the natives intended to rise and attack the ship. The captain, though he did not think them serious in such an attempt, yet was unwilling totally to disregard the intimation: he therefore ordered twenty stand of arms to be in readiness, in case any commotion should

be observed among them; but though the rumour increased throughout the day, yet no preparations could be perceived to countenance such a report; and the king continued his visits as usual, never coming empty handed.

On Friday, the 20th, the first and second lieutenants with one of the mates, being out on a shooting party, they were beset by more than fifty of the natives, who first took from them their arms, and then robbed them of what articles they had carried with them to trade. In the scuffle the first lieutenant lost the skirt of his coat, and one of the other gentlemen received a severe blow. When the robbers had stripped them of their merchandizes, they restored to them their fowling pieces. When this transaction came to the knowledge of Capt. Cook, he went immediately with a boat's crew on shore, and entered a large house wherein were two chiefs. This, with all their effects, he took possession of, and remained there, till he heard that the gentlemen had got safe on board, and had all their things restored to them. Oedidee informed us, Oree was so much affected with the relation of this, that he wept much. When on board, we learnt from the officers themselves, that a small insult on their part was the occasion of the affray; but some chiefs interfering, took the officers out of the croud, and caused every thing which had been taken from them to be restored. On the 21st, we saw upwards of sixty canoes, most of the people in them being Earecoies, steering for Ulitea, and we heard they were going to visit their brethren in the neighbouring islands. It seems these people have customs among them peculiar to themselves; and assist each other when necessity requires: we may therefore call them the Free Masons of Huaheine. This day Oree sent a message to Capt. Cook, desiring he would come on shore, and bring twenty-two men with him, in order to search for and chastise the robbers. Oedidee brought with him twenty-two pieces of leaves to assist his memory, a custom very common among these people. This message seemed to us an extraordinary one, and therefore the captain went to the chief for better information. Oree informed him, that these fellows were a set of banditti, who had formed themselves into a body, and had resolved to rob all they met, for which purpose they were now assembled and armed. These robbers Oree wanted us to attack, the captain said they would fly to the mountains; but he assured us to the contrary, and desired we would destroy both them and their habitations, only sparing their canoes. This request seemed extraordinary, but the captain was resolved to comply with it in part, lest these fellows should make more head, and become formidable; and also with a view of preventing the report from gaining ground in Ulitea, where we intended going, and we were apprehensive associations might be formed in like manner, and the people might treat us in the same way, or worse, they being more numerous. Capt. Cook and his officers made ready to accompany king Oree in the expedition against the robbers; and having ordered fifty marines with some sailors to be well armed, they landed near the palace of the king, and having required him to conduct them according to his promise, he very readily consented, and they all set out together in very good order. The party increased as we proceeded; and Oedidee told us, that several of the banditti had joined us, with the view of decoying us into a place, where they might attack us to advantage. As we could place no confidence in any other person, we took his advice, and proceeded with caution. We marched several miles, when Capt. Cook declared he would proceed no farther; besides, we were informed that the men had fled to the mountains. At this time we were about to cross a deep valley, with steep rocks on each side, where our retreat might have been rendered difficult, by a few men assailing us with stones. Oedidee persisted in his opinion; and we marched back in the same order as we came. As we went along, we observed several people coming down the sides of the hills with clubs, which they immediately hid when they found we saw them. This was some confirma-

tion of Oedidee's suspicions; but we could not persuade ourselves that the chief had any such intention, whatever might be the designs of his people. In our return we halted at a convenient place, and wanting some refreshments, they were immediately brought us. When we arrived at the landing place we discharged several volleys, to convince the natives, that we could support a continual fire; after which we returned on board, and the chief dined with us; having brought with him a hog ready dressed. After dinner we received a great number of presents as peace-offerings. Two chiefs brought each of them a pig, a dog, and some young plantain trees, and with due ceremony presented them singly to the captain. Another brought a very large hog, with which he had followed us to the ship. A quantity of fruit was brought us by others; so that we were likely to make more by this little excursion, than by all the presents we had made them; and the expedition had one good effect at least, for the people were convinced that musquets were more terrible things than they at first imagined. We were promised a larger supply of hogs and fruit the next day; but the chief was not so good as his word. We went ashore in the afternoon, and found him sitting down to dinner. The people about him immediately began chewing the pepper root; a cup of the juice was presented to Capt. Cook, but he did not like the method of brewing it. Oedidee was not so nice, and immediately swallowed what the captain refused. The chief washed his mouth with cocoa-nut water after he had taken the juice of the pepper root, and ate a large quantity of plantain, repe, and mahee, and finished his dinner by eating and drinking a composition of plantains, bread-fruit, mahee, &c. of the consistence of a custard; of this he took about three pints. He dined in the open air, at the outside of his house, and during dinner time a play was performing within the house.

On Monday the 23d, we put to sea. The chief and Capt. Cook took an affectionate leave of each other. When Oree heard that we never intended coming there any more, he said, Let your sons come, we will treat them well. We did not get a sufficient supply of hogs at this island, though they did not appear to be scarce; but we obtained more fruit than we well knew what to do with. Our stock in trade being nearly exhausted, we found it necessary to set the smiths to work, in making different sorts of iron tools, that an influence might be kept up at the other islands, and to enable us to procure refreshments.

On Tuesday the 24th, we anchored in Ulitea, and was visited by Oree the chief, who brought with him a handsome present. A party of us went ashore to make the chief a present, and as we entered his house we were met by five old women, who lamented very bitterly, and cut their faces in a shocking manner. This was not the worst part of the story, for we were obliged to submit to their amiable embraces, and get ourselves covered with blood. After this ceremony was over, they washed themselves, and appeared as cheerful as any other person.

On Friday the 27th, Oree paid us a visit, in company with his wife, son and daughter, and brought with them a very handsome present of all kinds of refreshments. We accompanied them on shore after dinner, and were entertained with a play which concluded with the representation of a woman in labour, performed by a set of brawny fellows; the child that was brought forth was at least six feet high. As soon as the child was delivered, they pressed his nose, which seemed to indicate that they really take this method with all their children, which occasions that flatness which their noses generally have. On the 29th several things were stolen out of our boats, which lay at the buoy; but on application to the chief, we had them all returned, except an iron tiller, and in lieu of that they brought us two large hogs. On Monday, the 30th, a party of us set out for Oedidee's estate on the thirtieth instant, accompanied by the chief and his family. When we arrived there, we found that Oedidee could not

not command any thing, though he had promised us hogs and fruit in abundance; they were now in possession of his brother. We had here an opportunity of seeing them kill and dress a pig, which was done in the following manner: three men first strangled the hog; the hog was laid on his back, two men laid a stick across his throat, pressing at each end, the third man stuffed up his fundament with grass, and held his hind legs. The hog was kept in this position for ten minutes, before he was dead. An oven, which was close by, was heated. They laid the hog on the fire as soon as he was dead, and singed off his hair; he was then carried to the sea-side and washed. The carcase was then laid on clean green leaves, that it might be opened. They first took out the lard, and laid it on a green leaf, the entrails were then taken out and carried away in a basket; the blood was put into a large leaf. The hog was then washed quite clean, and several hot stones were put into his body; it was then placed in the oven on his belly, the lard and fat were put in a vessel, with two or three hot stones, and placed along-side the hog; the blood was tied up in a leaf, with a hot stone, and put into the oven; they covered the whole with leaves, on which were placed the remainder of the hot stones; they afterwards threw a great deal of rubbish in, and covered the whole with earth. A table was spread with green leaves, while the hog was baking, which took up little more than two hours. We sat down at one end of the table, and the natives, who dined with us, at the other; the fat and blood were placed before them, and the hog before us. We thought the pork exceeding good indeed, and every part of it was well done. The natives chiefly dined of the fat and blood, and said it was very good victuals. The whole of this cookery was conducted with remarkable cleanliness. This estate of Oedidee was small, but very pleasant; and the houses

formed a pretty village. After we had dined, we returned to the ship. In our way we saw four wooden images, each two feet long. They stood on a shelf, had a large piece of cloth round the middle, a turban on their heads, stuck with cocks feathers. They told us these were their servants gods.

On Tuesday the 31st, the people hearing that we intended sailing, brought abundance of fruit on board, which continued on the 1st of June. We were informed that two ships had arrived at Huaheine. The person who brought the information described the persons of Capt. Furneaux and Mr. Banks so well, that we had no doubt of the truth of the assertion; we therefore thought of sending a boat over there, but a man came on board, and declared the whole to be a lye. We could not confront the fellow who brought the intelligence, for he was gone away, and the danger of sending the boat was put a stop to.

On Saturday the 4th of June, the chief and his family came on board to take leave, bringing a handsome present with them. These people denied that there were any ships at Huaheine. We were very much importuned to return to this place; when we told them we could not, their grief was bitter, and we believed it to be real. They desired Capt. Cook to acquaint them with his burial place, and said they would be buried with him. A strong proof of affection and attachment. We left Oedidee here, as we could not promise that more ships would be sent from England to those islands: he left us with infinite regret. Oedidee did not leave us till we were out of the harbour, and said to fire some guns, it being his Majesty's birth-day. This youth was of a gentle docile, humane disposition, and would have been a better specimen of the natives than Omiah.

THE day after we left Ulitea we saw land, which proved to be a low island discovered by Capt. Wallis, and called by him Howe Island. We saw land again on the 16th, which we called Palmerston Island, in honour of lord Palmerston, one of the lords of the Admiralty. On the 20th we discovered land again, and inhabitants appearing upon the shore; we equipped two boats, and as we approached, the inhabitants retired into the woods. When we landed, we took post on a high rock, to prevent a surprise, and the botanising party began collecting plants, with which the country seemed covered. Capt. Cook took two men with him and entered the woods, but on hearing the inhabitants approach they returned. We made every friendly sign in our power, but were answered by menaces; and one of the natives threw a stone, which struck one of our party. Two muskets were fired indiscriminately, and they all retreated into the woods. Having embarked, we proceeded along the coast till we came to a place where four canoes lay. In order to prevent being surprised, and to secure a retreat, the men were drawn up upon a rock, from whence they had a view of the heights. Capt. Cook and only four gentlemen with him went to look at the canoes. Very soon after the natives rushed out of the wood upon us, and we endeavoured to no purpose to bring them to a

parly; they threw their darts, and appeared very ferocious. We discharged some muskets in the air, but this did not intimidate them, for they still threw darts and stones. Capt. Cook's musket missed fire, otherwise he would certainly have killed the ring-leader of them. The men drawn upon the rock fired at some who appeared on the heights, which rather allayed the ardour of our antagonists, and we had an opportunity to join the marines. We do not think any of the natives were hurt, but they all retreated into the woods; and seeing we could make nothing of them, we returned to the ship. Capt. Cook named this place Savage Island, from the conduct and aspect of the islanders; its situation is south latitude 19 deg. 1 min. west longitude 169 deg. 37 min. its form is circular, and is about 11 leagues in circumference. The country appears entirely covered with trees and shrubs. Nothing but coral rocks were to be seen along the shores. The inhabitants do not appear to be very numerous; they go entirely naked, except round the waist, and seem stout well made men. Some of them had their thighs, breast, and faces painted black.

We steered for Rotterdam, and as we drew near it several canoes laden with fruit came along-side of us, but we did not shorten sail. The people on board them wanted us much to go towards their coast, telling us, as

well as they were able, we might safely anchor there. They enquired for Capt. Cook by name. We came to anchor on the north-side of the island on the 26th instant. The inhabitants brought to us great quantities of yams and haddocks, for which we gave them old rags and nails. A party of us went ashore to look for water, and were civilly received by the natives. We got some water, but it was rather brackish. We got a plentiful supply of fruit and oats, as well as water, but happened to leave the surgeon on shore. He got a canoe to bring him off; but just as he was getting into it, one of the natives snatched away his musquet and ran off with it, after which no person would bring him on board. He certainly would have been stripped, had he not presented a tooth-pick case to them, which they took for a little gun. When Capt. Cook heard of this transaction, he went ashore; but the natives fled at his approach. We did wrong in not taking any steps for the recovery of the gun, as it encouraged the inhabitants to make more depredations. A boat was sent ashore on the 28th for some water, when the people behaved in a rude and daring manner: it was with difficulty they got their water-casks filled, and into the boats again. The lieutenant who commanded this party had his gun snatched from him, and most of the people had something or other taken away from them. This was the effect of ill timed lenity. Capt. Cook landed soon after, and resolved to have the gun restored. All the marines were ordered ashore armed. As the botanizing party were in the country, three guns were fired from the ship to alarm them, as we did not know how the natives might behave to them. The natives knew well enough what we intended, and brought the musquet long before the marines got ashore. When the lieutenant and the marines arrived, they all fled; Capt. Cook seized two double canoes in the cove, and threw a few small shot into a fellow's legs, who made some resistance. We very soon obtained the other musquet, and then the canoes were restored. When we returned to the cove, the people wanted to persuade us that the man Capt. Cook fired at was dead, which we thought very improbable. Capt. Cook desired a man to restore a cooper's adze which had been stolen that morning, and he went away, as we thought, to fetch it; but we were mistaken, for he soon returned with the wounded man stretched out on a board apparently dead. The surgeon was sent to dress his wounds, which in his opinion were but slight, and of no consequence. Capt. Cook still insisted upon the adze, and with a great deal of difficulty obtained it. An old woman presented a young girl to Capt. Cook, giving him to understand that she was at his service. The girl was artful enough, and wanted to bargain for a shirt and a spike nail, neither of which the captain had with him. He was then given to understand that he might retire with her upon credit, which he refused. The old procuress then abused him, saying he was insensible to her charms; the girl was very pretty, and wanted to go aboard a ship with the captain; but he would not take her, as he had given orders no women should be admitted there.

On the 29th we sailed, and a great many canoes came up with us, loaded with fruit, &c. which were exchanged for the usual commodities. The passion of our people for curiosities was as great as ever, and they were stripped of most of the clothes the ladies of Otaheite had left them. We stretched out for Amattafoa on the 30th, and several canoes came to us from all parts with the common articles; out of one of them we got two pigs, which in this part of the world are a scarce commodity.

On Friday the first of July we discovered land, the master and the boat were sent into the sound to find anchorage, four or five people were discovered on the shore, who retreated as the boat advanced, and they all fled to the woods when the boat landed. The master returned, and brought word there were no soundings without the reef; that he rowed in for the shore, intending to speak to the people, who were about twenty in number, armed with clubs and spears; but they all

returned into the woods on his approach. He left some trifles upon the rocks, which they certainly found, for several people were seen at the place soon afterwards. The number of inhabitants on this island are supposed to be very few, and it is very probable that the few who are there only came to catch turtles, of which there are a great number here. This island is situated S. latitude 19 deg. 48 min. W. longitude 178 deg. 2 min. We called it Turtle Island.

After a good deal of stormy weather we saw an island, called by the natives Ambrym, on the 21st of July. We discovered a creek as we drew nearer the shore, which had the appearance of a good harbour; many people were assembled, who invited us on shore, but we did not chuse to go, as they were armed with bows and arrows. We sent out two armed boats to discover a port about a league more to the south, where we anchored in eleven fathoms water. Several of the natives came off to us, but acted with great caution; at last they trusted themselves alongside, and exchanged arrows for pieces of cloth. The arrows were pointed with bone, and dipped in a green gummy substance, which we imagined to be poisonous. Presents were made to two men who ventured on board, and others came at night for the same purpose, but they were not admitted.

On the 22nd, in the morning, several natives came round us; some swam, and others came in canoes. We prevailed on one man with some difficulty to come on board, and he was followed by more than we wished. Various articles were given to four of them, which were taken into the cabin; these they shewed to others in the canoes, who were very well pleased with their reception. We were all put in confusion by an accident which happened while these were in the cabin. One of the natives who had been refused admittance into one of our boats bent his bow at the boat-keeper, to shoot a poisoned arrow at him; he was prevented by some of his countrymen, and Capt. Cook was acquainted with it. Capt. Cook went on deck, and saw a man struggling with him, who had leaped out of the cabin window for this purpose. The fellow again pointed his arrow at the boat-keeper; and on Capt. Cook's calling out, he pointed the arrow at the Captain, who instantly fired a musquet at him. This staggered him for a little while, but he again pointed his arrow; a second shot obliged him to desist. Several began to shoot arrows on the other side; but they were all sent off in the utmost confusion, by a four pound shot being discharged over their heads. They all to a man leaped overboard. We permitted them to come and take away their canoes, and some again came alongside the ship. We heard the beating of drums on shore as soon as the four pounder was fired, which we took for the signal for the country to assemble under arms. However, we determined to go on shore and seek for wood and some refreshments, which we were very much in want of.

We landed in the face of five hundred men, armed with bows, arrows, spears, and clubs, but they made no opposition. Capt. Cook advanced alone, with nothing but a green branch in his hand; on seeing this, a person who seemed to be a chief gave his bow and arrows to another, and came to meet him in the water, took the captain by the hand, and led him up to the crowd. The marines were at this time drawn up on the beach. Capt. Cook distributed several presents among them. We made signs that we wanted wood, for not one word of their language could we understand, and in return they made signs for us to cut down the trees. They brought a small pig for a peace offering, and we flattered ourselves with the hopes of procuring more, but these were vain and delusive; for we only got a small quantity of water, and about half a dozen cocoa-nuts. They parted freely with their arrows, but we could not purchase of them any bows without a great deal of difficulty. They did not seem to set the least value upon any thing we presented them with, nor did they like we should proceed farther than the beach, and seemed very desirous of our returning on

MAN of the Island of MALICOLO

WOMAN of the Island of MALICOLO

on board: this we did after we had cut down some wood, and they all retired into different parts of the country. In the afternoon we observed a man bringing along the buoy, which had been taken from the kedge anchor; and when we sent some of our crew ashore for it, he immediately delivered it. This was the only thing they had attempted to take from us. Capt. Cook and Mr. Forster went to examine some of their houses, which bore a resemblance to those on the other isles. They saw a great number of fine yams, and several pigs and fowls. They called this island Mallicolae, another near it Apee, and a third Paoom. We went in search of fresh water, but without success. The curiosity of these people was soon satisfied, for none of them came on board the ship. When they saw us under sail, they came off to us in a number of canoes, and gave us many proofs of their extreme honesty, which rather surprised us, as we had lately been among a most thievish race.

The people of this island are very ugly and ill-proportioned, dark in their complexion, and of a diminutive size. Their heads are long, their faces flat, and their features very much resemble those of a baboon: their beards are of a dark colour, strong and bushy. The men go quite naked, except a wrapper round their waists. The women we saw were as ugly as the men. Their faces, heads, and shoulders were painted red. Some of them had a bag round their shoulders, in which they carry their children; and they wear a sort of red petticoat. We saw but few of them, as they generally kept at a distance when we were on shore. They wear bracelets, and ear-rings made of tortoise shell, hogs tusks bent circular round the right wrist, and rings made of shells. They run a piece of white stone, an inch and a half long, through the bridge of their noses, which are pierced for that purpose. They sprinkle water over their heads, and present a green branch, as tokens of friendship. Their weapons are bows, arrows, clubs and spears. They seem unlike all the natives we have met with, and speak quite a different language. Their country must be fertile, but the fruits are not remarkably good. We left them a dog and a bitch, they having none on the island, and as they seemed very fond of them, we doubt not but they will take care to preserve them. The harbour is a very good one, and we named it Port Sandwich.

Continuing our course from hence, on the twenty-fourth of July we discovered several small islands, one of which we came very near. It is about 12 miles in circumference, and has three high peaked hills upon it. We therefore named it Three Hill island. We then passed a group of small islands, which we called Shepherd's isles, in honour of Dr. Shepherd of Cambridge. We discerned people in every one of these islands: but there were no soundings near them at one hundred and eighty fathoms. We found the southern lands to consist of one large island, the extremities of which we could not see. On the north side of this extensive island we saw three or more smaller ones. One of these we called Montague, another Hinchinbrook and the largest Sandwich, in honour of the earl of Sandwich, first lord of the Admiralty. Several people came down as we passed Montague island, and seemed to invite us in a friendly manner on shore. We saw some likewise on Sandwich island, the surface whereof appeared very delightful, being agreeably diversified with woods and lawns. As we could not approach it at this time, we steered more to the west, as there appeared a bay to run up in that quarter, and a good shelter from the winds. But as this was not so much our object as to discover the southern extremity of the Archipelago, we steered E. S. E. which was the direction of Sandwich island.

On the first of August, we gained the N. W. side of the island, and saw several inhabitants, who invited us ashore by various signs. Here we should have anchored, but the wind obliged us to alter our design. Besides we wanted to explore the lands to the S. E. therefore ranged along the coast. As we continued our course, we saw a light a-head; and it being near No. 19.

evening we did not chuse to proceed any farther, but flood off and on all night. When the sun rose next morning it disappeared, and we saw not any land but the coast we were near. On the 3d, we sent a boat on shore to get some wood if possible, being much in want of that article; but our people could not land on account of a high surf of the sea; and they saw not any natives on that part of the isle. Having anchored in seventeen fathoms water, under the N. W. side of the head of the land, we saw several people on the shore, some endeavouring to swim off to us; but they all retired when they perceived our boat approach towards them. On the 14th, a party went out armed to find a proper landing place, and where we might gain a supply of wood and water. We gave the inhabitants some medals, &c. with which they appeared much pleased, and directed us to a bay fit for our purpose. As we went along the shore their numbers increased prodigiously. We tried several places to land, but did not approve of their situation. At length we came to a fine sandy beach, where Capt. Cook stepped out without wetting his foot. He took but one man with him out of the boat, and landed in the face of a large number of people, having only a green branch in his hand. The inhabitants received him with great politeness. One of them, who appeared to be a chief, made the natives form a semicircle round the head of the boat, and chastised such as attempted to prevent it. The captain gave this person several articles, and by signs signified his want of fresh water; upon which a little was presently presented to him in a bamboo, and having made signs for something to eat, they brought him yams and cocoa-nuts. Their behaviour was in every respect agreeable, yet we did not much like their appearance, as they were all armed with bows, arrows, clubs, spears, and darts. On this account we kept a good look out, and watched particularly the motions of the chief, who wanted us to haul the boat on shore. He renewed his signs for this to be done, and then held a conference with some of the natives. One circumstance appeared rather suspicious, he refused some spike nails that we offered him. Capt. Cook immediately returned to the boat, upon which they attempted by force to detain us. Very fortunately the gang board happened to be laid out for the captain to return into the boat; this some of the natives unhooked from the stern as we were putting off; they then hooked it to the head of the boat, and attempted to haul her on shore. Some of them were daring enough to take the oars out of a few of our peoples hands. They in some measure desisted, on Capt. Cook's presenting a musket, but went on again in an instant, seemingly determined to haul the boat on shore, and to detain us. The chief was at the head of this party, and others stood at a small distance behind, with stones, darts, and other missile weapons, ready to support them. Our own safety was now become our only consideration, for signs and threats had not the effect we expected. The captain therefore resolved to make the chief suffer alone, a victim to his own treachery; but at this critical moment his piece did not go off. This increased their insolence, and they began to assault us with stones, darts, and arrows. We were now ordered to fire. The first discharge threw them into confusion; but they were very reluctantly driven off the beach by the second. After this they continued a kind of bush fighting, by throwing stones from behind trees, and sometimes a dart or two. Four of them lay to all appearance dead on the shore, but two of them afterwards crawled in among the bushes. It was a fortunate circumstance for these assailants, that more than half our muskets missed fire, otherwise we should have done much more execution among them. One of our crew was wounded in the cheek with a dart, which entered near two inches; and an arrow struck Mr. Gilbert's breast, but it hardly penetrated the skin. Having returned after this skirmish was ended on board, the captain ordered the anchor to be weighed, with a view of proceeding with the ship to the landing-place. While this was doing, several of the natives appeared

on a low rocky point, displaying the two oars which they had taken from us in the late scuffle. We thought they were desirous of returning the oars, and that their manner of behaving might be a token of submission: nevertheless, that they might understand the effect of our great guns, we fired a four pound shot at them, which, though it fell short, terrified them so much, that we saw no more of them, and when they went away they left the two oars standing up against the bushes. By this time our anchor was at the bow, when a breeze sprung up at N. upon which we set our sails, and plyed out of the bay, for here we could not supply our wants with conveniency, and in case a better place could not be found to the S. we had it in our power at any time to return hither.

The natives of this island are of a middle size, regular features, and pretty well made. They are of a different race from those of Mallicolæ, as well in their persons, as their language. Their complexions are naturally dark; yet they paint their faces, some with black, and others with red pigment. Their hair is curly, but somewhat woolly. The women were not very inviting, being rather ugly. They wear a petticoat made of a plant like palm leaves; and the men go in a manner naked, having only a belt and wrapper round their waist. They live in houses covered with thatch, and their plantations are laid out by line, and fenced round. We saw no canoes in any part of the island.

On Thursday the 4th of August, at two o'clock P. M. we cleared the bay, and steered for the south end of the island. We discovered on the S. W. side of the head a pretty deep bay; its shores low, and the land appeared very fertile, but being exposed to the S. E. winds, until better known, we think that on the N. W. side preferable. The promontory or peninsula, which disjoins these two bays we named Traitor's Head, from the treacherous behaviour of its inhabitants; it forms the N. E. point of the island, and is situated in the latitude of 18 deg. 43 min. S. and in 169 deg. 28 min. E. longitude. It terminates in a saddle hill, which may be seen 16 or 18 leagues off at sea. We continued our course to the S. S. E. when the new island we had before discovered, appeared over the S. E. point of one near us, distant about 10 leagues. Leaving the last, we steered for the east end of the former, being directed by a great light we saw upon it. On the 5th, at sunrise we came in sight of an island, being high table land, bearing E. by S. and also discovered another little low isle which we had passed in the night. Traitor's Head was still in sight, and the island to the S. extended from S. 7 deg. W. to S. 87 deg. W. distant four miles. The light seen in the night we now found to have been a volcano. A rumbling noise was heard, and it threw up great quantities of smoke and fire. We now steered for the island; and discovered a small inlet which had the appearance of a good harbour. Two armed boats, under the command of Lieut. Cooper, were sent off in order to sound, while the ship stood on and off, to be ready to follow or to afford any assistance that might be required. We observed a number of the natives on the east point of the entrance, also several canoes; and when our boats entered the harbour they launched some, but came not near. At this time Lieut. Cooper made the signal for anchorage, and we stood in with the ship. The wind having left us when we were within the entrance, we were obliged to drop anchor, in four fathoms water. The boats were now sent out to find a better anchorage; and while we were thus employed, many of the natives came in parties to the sea-side all armed, some swam off to us, others came in canoes. At first they seemed afraid of us, and kept at a distance, but by degrees waxed bolder, and at length came under our stern, and made some exchanges. Those in one of the first canoes threw towards us some cocoa-nuts. The captain went out in a boat, picked them up, and in return gave them several articles. Others were induced by this to come along-side, who behaved in a most insolent manner. They attempted to tear our flag from the staff, would have knocked the rings from the rudder, and we had no sooner thrown out the buoys of the anchor from the

boats than they got hold of them. We fired a few muskets in the air, of which they took no notice, but a four pounder alarmed them so much, that they quitted their canoes, and took to the water. But finding themselves unhurt, they got again into their canoes, flourished their weapons, hallowed in defiance, and went again to the buoys, but a few musketoon shot soon dispersed them. They all retired in haste to the shore, and we sat down to dinner, unmolested. In the interval of those transactions, an old man, who seemed to be amicably disposed, came several times, in a small canoe between us and the shore, bringing off each time cocoa-nuts and yams, for which he took in exchange whatever we offered him. Another was in the gangway when the great gun was fired, after which we could not prevail on him to stay. In the evening we landed at the head of the harbour, with a party of men well armed. The natives made not the least opposition, though we had one body on our right, and another on our left, all armed. We distributed among the old people some presents of cloth and medals, and filled two casks with fresh water, an article we gave them to understand we much wanted. We got in return plenty of cocoa-nuts, but could not prevail on them to part with their weapons, which they held constantly in a posture of defence. The old man was in one of these parties, but by his behaviour, we judged his temper to be pacific. We thought, by their pressing so much, in spite of all our endeavours to keep them at a distance, that little would be wanting to induce them to attack us; but we re-embarked very soon, and thus, probably, their scheme was disconcerted.

Saturday the 6th, we brought the ship as near the landing place as possible, that we might overawe the natives, and cover the party on shore, who were to get a supply of wood and water, which we much wanted. While we were upon this business, we observed the natives assembling from all parts, all armed, to the amount of some thousands, who formed themselves into two divisions, as they did the preceding evening, on each side the landing place. At intervals a canoe came off, at times conducted by one, two or three men, bringing us cocoa-nuts, &c. for which they did not require any thing in return, though we took care they should always have something: but their principal intention seemed to be, to invite us ashore. The old man before mentioned, came off to us several times, and the captain with a view of making him understand, that he wanted to establish a friendly intercourse, took his weapons that were in the canoe, and threw them overboard, and made him a present of a piece of cloth. He understood the meaning of this, for we saw him frequently in conversation with his countrymen, to whom he made our request known, going first to one party, then to another, nor did we afterwards see him with his weapons, or in a warlike manner. Soon after a canoe, in which were three men, came under our stern, one of whom behaved very outrageously, brandishing his club, and striking with it the ship's side; at last he offered to exchange his weapon for a string of beads, and other trifles; these we sent down to him by a line, of which he had no sooner got possession, than he made off, without delivering his club. We were not sorry for this, as it afforded us an opportunity of shewing the people on shore the effect of our fire arms. We therefore without hesitation, complimented this fellow with the contents of a fowling piece, loaded with small shot, and when the others were out of the reach of musket shot, we fired some musketoons, or wall pieces at them, which made them take to the water. But all this seemed to make very little impression on the people ashore, who began to hallow, and seemingly made a joke of it. Having moored the ship, with her broad-side to the landing place, and scarcely musket shot off, we planted our artillery in such a manner as to command the whole harbour, and then embarked with a party of seamen, supported by the marines, and rowed to the landing place, where we have before observed the natives were drawn up in two divisions. The intermediate space between them was about 40 yards, in which

The Landing of CAPTⁿ COOK, &c. at TANNA, one of the NEW HEBRIDES.

ВЪЗМЪЗДАЮЩАЯСЯ ЗА ПОВРЕЖДЕНІЯ

which were laid a few plantains, two or three roots, and a yam. Between these and the water, four small reeds were stuck upright in the sand, in a line at right angles to the shore, for what purpose we could not learn. They remained here for some days. By these the old man stood, and two companions, who by various signs invited us to land, but we thought these a decoy, and looked something like the trap we had like to have been caught in at the last island. We made signs for the divisions to retire back, but to these they paid not the least regard, their number every moment was augmented, and, except two or three old men, not one unarmed. From all these circumstances we concluded they meant to attack us as soon as we landed; but this we wished to avoid, as many of them must have been killed or wounded, and we could not expect to come off without some damage. We thought it therefore better to frighten them into a more peaceable behaviour, and therefore a musquet was fired over the party on our right, which for about a minute had the desired effect, but they soon returned to their daring behaviour. The ship was then ordered, by signal, to fire two or three great guns, which presently dispersed them. We immediately landed, and marked out the limits on the right and left, by a line. Our old friend, who stood his ground, we rewarded with a present. Some of the natives returned, with a more friendly aspect. Many came without their weapons, but the greatest part with them. We made signs that they should lay them down, and they gave us to understand, that we must lay down ours first. Thus both sides stood under arms, and the presents we made to the old people had little influence on their conduct. Many were afraid to touch what belonged to us, and climbing the cocoa-nut trees, they threw us down the nuts, but they seemed to have no notion of exchanging one thing for another, though we always took care they should have a compensation. We took the old man (whose name we now found to be Paowang) to the woods, and made him understand we wanted to cut down some trees, to which he readily consented, provided fruit trees were not of the number. At the same time we cut down some trees, which we put into our boats, and a few small casks of water, with a view of letting the natives see what we chiefly wanted. Thus far matters were pretty well settled: we returned on board to dinner, and they all dispersed. In the afternoon a fishing party went out. We loaded the launch with water, and having made three hauls with the seine, caught upwards of 300 pounds of mullet and other fish. During this time not above thirty of the natives appeared, among whom was our trusty friend Paowang, who made us a present of a pig, the only one we got at this place. Throughout the night the volcano, which was about four miles to the west of us, emitted vast quantities of fire and smoke, attended by a violent rumbling noise: this was increased by a heavy shower of rain, which fell at this time. The noise was like that of thunder, or the blowing up of mines; the flames were seen to rise above the hills; and the air was loaded with ashes, with which every thing was covered. They resembled a kind of fine sand, or rather stone ground to powder, and the dust was not a little troublesome to the eyes.

On Sunday the 7th, the natives began to assemble again, early in the morning, with their weapons, as before, but not in such numbers: notwithstanding this, we landed in order to get water, and cut wood. We found most of the old people disposed to be our friends, but the younger being daring and insolent, obliged us to stand to our arms. Mr. Edgcumbe, one of the lieutenants who commanded the party, fired, and wounded a man with a swan-shot, after which the others behaved better, and when our people embarked they all retired in a peaceable manner. While we were at dinner an old man came on board, and after having examined several parts of the ship, returned to his friends on shore. We were now on a tolerable footing with such of the natives who lived in the neighbourhood, who only made their appearance, so that a sergeant's guard was thought sufficient for the protection of the

wood and water parties. Some of our people had left an ax on the beach or in the woods, which Paowang returned to us; also a few other articles which had been lost through negligence. The natives invited some of our people to go home with them, on condition that they would strip themselves naked as they were; a proof of their not harbouring a design of robbing them, whatever other they might have. On the 8th, early in the morning, the launch was sent under the protection of a party of marines in another boat, to take in wood, water, and ballast, when the natives seemed pretty well reconciled to us. On the 9th, our people were employed about the same business, and Capt. Cook was received very courteously by the natives, though armed, inasmuch that there was no longer any occasion to mark out the limits by a line, seeing they observed them without this precaution. He prevailed on a young man, named Wha-a-gou to accompany him on board, but nothing in the ship seemed to engage his attention. The goats, dogs, and cats, he called by the same name; which in his language signifies hogs. He seemed more fond of a dog and bitch than of any other animals, and we presented him with one of each. He sat down to dinner with us, but would only just taste our salt pork; however he eat pretty heartily of yam, and drank a glass of wine. Some of this young man's friends were probably doubtful of his safety, and therefore followed him in a canoe, but on his speaking to them out of the cabin window, they went on shore, and soon returned with a cock, some cocoa-nuts, and a sugar cane. After dinner he was conducted ashore loaded with presents. Upon landing, some of his friends took Capt. Cook by the hand, and, as we understood, would have led him to their habitations, but on the way, they made a sudden stop, and were unwilling he should proceed. The captain was desired to sit down. During this interval several of our gentlemen passed us, at which they expressed great uneasiness, and importuned the captain so much to order them back, that he was obliged to comply. Indeed they were not only jealous of our going up the country, but even along the shore of the harbour. While we were waiting here, our friend Paowang brought us a present of fruit and roots, by a party of 20 men, though they might all have been carried by two; perhaps this might be done with the view of making the present appear the greater; for one had a bunch of plantains, another a yam, a third a cocoa nut, &c. The captain paid these porters, though the present was in return for one he had made in the morning. Wha-a-gou and his friends were still for detaining us, and seemed to wait with impatience for something to give us in return for the dogs, but night approaching, we desired to depart; and they complied with our solicitations. We now learnt, by means of Mr. Forster's enquiries, that the proper name of this island is Tanna. The natives also told us the names of other neighbouring isles. That we touched at last is called Erromango; the small one which we saw the morning we landed here, Inmer; the table island to the east, discovered at the same time, Erronan, or Footoona; and one that lies to the S. E. Annatom; all which islands are to be seen from Tanna. It is a little remarkable, that the natives of this island were more scrupulous in taking any thing from the sailors, than those of any other nation, and never would touch with their bare hands what was given them, but always received it between green leaves, which they afterwards tied up and carried upon the ends of their clubs; and if any of our seamen touched their skin, they always rubbed the part with a green leaf. When these people make a wonder at any thing, they cry Hebow, and shake their right-hands. They wear bracelets, like as the Indians of Venemous Bay, in which they stick their hair pricker, and likewise their slings, with which they throw their javelins: and it is astonishing with what dexterity and force some of them will hit a mark. One of them, in the presence of the first lieutenant, shot a fish as it swam along in the sea, at the distance of 26 yards, with a bow and arrow, which the lieutenant carried on board with the arrow sticking in his body,

as a proof of what he had seen performed. But notwithstanding their delicacy and skill as marksmen, they gave us to understand that they eat one another; and one day when the inhabitants about the bay had marched forth armed, on an expedition, to a distant part of the island, those that remained invited us to feast upon a man whom they had barbiqued, which invitation our gentlemen refused with the utmost disgust. It has been said, that no nation could be cannibals, had they other flesh besides human to eat, or did not want food; but we cannot ascribe the savage custom of these people to necessity, since the island abounds with plenty of hogs, fowls, vegetables, and fruit. While some of our people were employed in searching for ballast, they discovered water issuing from the crevices of a rock, hot enough to draw tea; which circumstance led to the discovery of some hot springs, at the foot of the cliff, below high-water mark. In one place the waters were so hot, that there was no bearing the finger in them: in another they were just hot enough to bear to plunge the whole body, but not remain long therein. Two of the ship's company, who had been troubled with rheumatic complaints, at times, throughout the voyage, went accompanied with the surgeon, to one of these springs, but found the stones so hot that they could not stand upon them, without first plunging in some of their cold garments, to keep the soles of their feet from touching them; but the effect of these waters was found to be only a temporary relief.

On Wednesday the 10th, Mr. Wales, accompanied by some of the officers, proceeded for the first time into the country, and met with civil treatment from the natives. They saw in the course of this and another excursion, several fine plantations of plantains, sugar-canes, &c. and by this time, the natives in our neighbourhood, appeared so well reconciled to us, that they expressed no marks of displeasure at our rambling shooting parties. But after we had been several days taking in wood and water, they began again to be troublesome, watching every opportunity to level their arrows at the guard, and seemed to be restrained only by the fear of their muskets from proceeding to extremity. It is more than probable, however, that an act of violence on the part of our men, might, by a wanton use of their fire-arms, have caused their resentment; for in the afternoon of this day, a few boys, having thrown two or three stones at the wood-cutters, they were fired at by the petty officers present on duty. Having occasion for some large timber to repair the decays of the ship, orders had been given a few days before, to cut down a tree of vast growth; and for the convenience of getting it aboard, to saw it into three pieces. This tree so divided, the natives eyed with pleasure, not suspecting our men intended to carry it off, but to leave it in compliment to them, as it suited exactly their ideas of constructing just double the number of canoes. To the cutting down and sawing the trees the natives made no opposition; but when they saw the sailors employed in rolling down the body of the tree to the water's edge, they could not help looking furly; and one of them, probably more interested than the rest, was frequently seen to offer his spear at the labourers, but was restrained for fear of the guard: at length he watched his opportunity, and, starting from behind a bush, was levelling an arrow at the commanding officer, when he was discovered, and shot dead. The ball tore his arm to pieces, and entered his side. His companions instantly carried off the body, and laid it in the wood, where the ship's surgeon went to examine it, but found the man totally deprived of life. Capt. Cook was much displeased with the conduct of these officers, and took measures to prevent a wanton use of fire-arms for the future. The ship's company were now permitted to go ashore only by turns, for the preservation of their health; and the captain knowing the natives wanted nothing so much as an opportunity to revenge the death of their companions, strictly enjoined them never to walk alone; nor to stray more than 100 yards from the guard.

On Thursday the 11th, during the night, the volcano was very troublesome, and threw out great quantities of fire and smoke, with a most tremendous noise; and sometimes we saw great stones thrown into the air. In several parts of the harbour, places were found from whence a sulphurous smell issued, and the ground about these was very hot. Mr. Forster and his botanizing party, on one side of the harbour, fell in with our friend Paowang's house. Most of the articles he had received from us were seen hanging about the bushes and trees near his dwelling. On the 12th, the volcano was more furious than ever, and we were much molested with the ashes. Some of our gentlemen attempted to ascend a hill at some distance, with an intent of observing the volcano more distinctly; but they were obliged to retreat precipitately, the ground under them being so hot, that they might as well have walked over an oven: the smell too of the air was intolerably sulphurous, which was occasioned by a smoke that issued from the fissures of the earth; yet in this smoke the natives seek a remedy for cutaneous disorders. Mr. Forster observing a man holding a child over the smoke, had the curiosity to enquire the reason, who made him understand, by shewing the child's eruptions, that it was troubled with the itch. The rain that fell this day was a mixture of water, sand, and earth; so that we had, properly speaking, showers of mire. The natives pretended to be unwilling, that we should this day go far up the country by ourselves, and offered their services to conduct us to the mouth of the volcano. We readily accepted their offer, but instead of shewing us the way to the place, we found ourselves near the harbour before we discovered the trick.

On Saturday the 13th, Paowang came on board to dine with us. We took this opportunity of shewing him every part of the ship, and a variety of trading articles, hoping he might see something that he liked, and so a traffic be carried on with the natives for refreshments, of which what we had hitherto obtained were very trifling. But Paowang beheld every thing with the greatest indifference, except a wooden sand-box, of which he took some notice. On the 14th, a party of us endeavoured to get a nearer view of the volcano, and took our rout by the way of one of those hot places already mentioned. In the way we dug a hole, into which was put a thermometer of Fahrenheit's construction. The mercury rose to 100 degrees; but the instrument remained in the hole near three minutes without its rising or falling. At this place the earth was a kind of white clay, and had a sulphurous smell. It was soft and moist under the surface, over which was a thin dry crust, having upon it some sulphur, and a vitriolic substance, tasting like alum. The place affected most by the heat, and where we made the experiment, was not above eight or ten yards square. Near this was a fig-tree which seemed to like its situation. We proceeded up the hill through a country entirely covered with plants, shrubs, and trees, inasmuch that the bread-fruit, and cocoa-nut trees, were in a manner choaked up. Here and there we met with a few people, a house or two and some plantations in different states; one appearing of long standing; another lately cleared; and several just ready for planting. The clearing a piece of ground must be a work of much time and labour, seeing their working tools, though the same as those used in the Society Isles, are inferior to them; nevertheless their method is judicious, and as expeditious as well can be. They dig under the roots of the large trees, and there burn the branches, plants, and small shrubs. In some parts, the soil is a rich black mould; in others a kind of compost formed of decayed vegetables and the ashes of the volcano. We now came to a plantation where we saw a man at work, who offered to be our guide. We had not walked far before we came to the junction of two roads, in one of which stood a man with a sling and stone, which he would not lay down till a musket was pointed at him; he seemed, however, determined to dispute the road with us, and partly gained his point, for

THE GARDEN OF THE

for our guide led us another way. The other man followed, hallooing, as we supposed, for a reinforcement, and, indeed, we were presently joined by others of the natives, among whom was a young woman with a club in her hand. These people conducted us to the brow of a hill, and pointed to a road leading down to the harbour. But not choosing to take this, we returned to that we had left, and here our guide refused to go any farther with us. Having ascended another ridge, we saw other hills between us and the volcano, which seemed as far off as at our first setting out. We therefore resolved to return, and just as we were about so doing, we were met by 20 or 30 people, assembled as we thought to oppose our advancing into the country, for when they saw us returning, they suffered us to go on unmolested, and by the way regaled us with a variety of fruits. What we did not eat on the spot, they brought down the hill with us. Thus we found these people courteous and hospitable, when not prompted to a contrary conduct by jealousy; for which they were not to blame, if we consider their rude state, and ignorance of our real design. This indeed was to pay them a friendly visit, but considering all the circumstances attending this, might they not reasonably suppose, notwithstanding fair appearances, that we came to invade their country? Did we not enter their ports, without their daring to oppose? Did we not effect a landing by the superiority of our arms? Would they not therefore be jealous of such intruding strangers? When we endeavoured to advance into their country, they might naturally form unfavourable notions of us; especially if we consider how often they are at war both among themselves and with their neighbours. We must here observe, that some of our gentlemen were of opinion, that these people were addicted to an unnatural passion, Mr. Forster's man, who carried his plant bag, having been once or twice attempted: but as the carrying of bundles is the office of the women of this country, others thought, the natives might mistake him for a woman. This man was to-day one of our party, and as he followed the captain down the hill, having his bag as usual, we plainly understood by the conversation and actions of the natives, that they considered him as a female; and when, by some means they discovered their mistake, they exclaimed, with much surprise, Erramange! Erramange! It is a man! It is a man! Every one now perceived, and was well assured, they had before mistaken his sex; and hence it is plain, how liable we are to form false conjectures and opinions of a people, with whose language we are not much acquainted: for had we not now been undeceived, it is not to be doubted, but that these people would have been charged with the odious practice of which they had through ignorance been suspected.

In the evening, a party of us again walked into the country on the other side of the harbour, where we met from the natives, among whom was Paowang, friendly treatment. They discovered a readiness to oblige us in every thing in their power. We entered the village we had visited on the 9th instant, containing about 20 houses, built like the roof of our thatched dwellings in England, with the walls taken away, and open at both ends; but others are partly closed with reeds, and all were covered with palm thatch. Some are 40 feet long, and 16 in breadth. Besides these, we saw other mean hovels. One of these was separated from the others by a reed fence, and we understood a corpse was deposited therein. At one end of the hut hung a basket, with a piece of roasted yam, and some leaves quite fresh. We had a strong inclination to see the inside, but the man peremptorily refused our request. He would neither remove the mats with which one end of the hut was closed up, nor suffer us to do it; and shewed an unwillingness to permit us to look into the basket. He had two or three locks of human hair tied by a string round his neck, and a woman present had several about her neck. We would have purchased them, but they gave us to understand by signs, that they were a part of the hair of the de-

No. 20.

ceased, and on that account they could not part with them. This custom is similar to that among the natives of Otaheite and New Zealand, the former make Tamau of the hair of their departed friends, and the latter ear-rings and necklaces of their teeth. Not far from most of the large houses, the stems of four cocoa-nut trees were fixed upright in the ground, in a square, about three feet from each other, for the purpose of hanging cocoa-nuts to dry. Near most of them is also a large tree or two, whose branches afford an agreeable retreat from the heat of the scorching sun. This part of the island is well cultivated, abounding with plantains, roots, and fruit trees. One of our people weighed a yam which exceeded 55 pounds. The trees too are of an extraordinary size: but a wide circle in the interior part of the island, discovered nothing to the eye but a dreary waste, covered with cinders, and tainting the air with sulphur. Other surrounding islands looked pleasant to the eye; but according to the report of the natives of Tanna, abounded in nothing of which they themselves could want.

On Monday the 15th, preparations were continued on board to set sail, the ship was smoked above and below: the hold fresh stowed; the ballast shifted; the wooding and watering were finished; the rigging setting up; and a few hands only were on shore making brooms; in short every thing was placed in such order, as if the ship had been but just fitted out at home for a long voyage. One of the botanical party this day shot a pigeon, in the claw of which was a wild nutmeg. Mr. Forster endeavoured, without success, to find the tree. During their excursion, they observed in most of the sugar plantations deep holes dug, four feet deep, and five in diameter, which, on enquiry, we found were designed as traps to catch rats in. These animals, so destructive to sugar-canes, are here in great plenty. Round the edge of these pits, as a decoy, and that the rats may be more liable to tumble in, the canes are planted as thick as possible. On the 16th, we found our tiller very much damaged, and by neglect, we had not a spare one aboard. We knew of but one tree in the neighbourhood that would do for our purpose. The carpenter was sent ashore to examine it, and upon his report a party of men were directed to cut it down, after the consent of the natives had been obtained. They did not make the least objection, and our men went instantly to work. Much time was necessary to cut it down, as the tree was large; and before they had finished their work, word was brought to the captain, that our friend Paowang was not pleased. Paowang was sent for, and our necessity explained to him. We then made him a present of a piece of cloth and a dog, which readily obtained his consent, and the voices of those who were with him in our favour. Having thus obtained our point, we conducted our friend on board to dinner; after which we went with him ashore to pay a visit to an old chief, who was said to be the king of the island; though as Paowang took little notice of him, we doubted the fact. His name was Geogy. He had a cheerful open countenance, though he was old, and wore round his waist a broad red and white chequered belt. His son was with him, who could not be less than 50 years old. At this time a great concourse of people from distant parts were assembled near the watering place. The behaviour of many was friendly; of others daring and insolent; which we did not think prudent to resent, as our stay was nearly at an end.

On Wednesday, the 17th, Old Geogy, and his son, with several of his friends, dined with us on board the ship, every part of which they viewed with uncommon attention and surprise. They made a hearty dinner on a pudding made of plantains and greens; but would hardly taste our salt beef and pork. In the afternoon they were conducted ashore by the captain, after he had presented them with a hatchet, some medals, and a spike nail. On the 18th, the captain and Mr. Forster tried, with Fahrenheit's thermometer, when the tide was out, the head of one of the hot springs; and where the water bubbled out of the sand

from under the rock, at the S. W. corner of the harbour, the mercury rose to 202 deg. It is an opinion with philosophers, that volcanos must be on the summits of the highest hills; yet, this volcano is not on the highest part of the ridge, but on the S. E. side of it; and some of the hills on this island are more than double the height of that on which the volcano is, and close to it. Nor is it less remarkable, that in wet or moist weather, the volcano is more violent in its eruptions. We must here content ourselves with stating facts: the philosophical reasoning on these phenomena, we leave to men of more abilities, whose talents may lay in this line. On Friday the 19th, we prepared for sailing, as the tiller was finished; but the wind being unfavourable, the guard and a party of men were sent ashore, to bring off the remainder of the tree from which we had cut the tiller. The captain went with them, and found a good number of the natives collected together near the landing-place, among whom various articles were distributed. At the time our people were getting some large logs into the boat, the centry presented his piece at one of the natives, and, without the least apparent cause fired at, and killed him. A few of the natives had just before advanced within the limits, to see what we were about, but upon being ordered back, they readily obeyed. The fellow of a centry pretended, that a man had laid his arrow across his bow, so that he apprehended himself in danger; but this had been frequently done, out of a bravado, to shew they were armed, and prepared equally with ourselves. Capt. Cook was highly exasperated at this rascal's rash conduct; and most of the people fled with the utmost precipitation. As they ran off, we observed one man to fall; and the captain went with the surgeon, who was sent for to the man, whom they found expiring. His left arm was much shattered, and from hence the ball had entered his body by the short ribs, one of which was broken. What rendered this incident the more affecting was, that the man who bent the bow was not shot, but one who stood by him. The natives were thrown into such consternation, that they brought abundance of fruit, which they laid down at our feet. They all retired when we returned aboard to dinner, and only a few appeared in the afternoon, among whom were Paowang, and Wha-a-gou.

On Saturday, the 20th, the wind was favourable for getting out of the harbour; for during the night it had veered round to the S. E. At four o'clock A. M. we therefore began to unmoor, and, having weighed our anchor, put to sea. As we sailed we heard a noise, not unlike psalm singing. It was now too late to enquire into the cause; probably the natives were performing some religious acts. We thought that the east point of the harbour was sacred to religion, for some of our people had attempted to go to this point, and were prevented by the natives. They were always jealous of our proceeding into the country beyond certain limits: they might be apprehensive of an invasion, and that we meant to take their country from them. All we can say is, that no part of our conduct justified such a conclusion. We never gave them the least molestation; nor did we touch any part of their property, not even their wood and water, without having first obtained their consent. Even the cocoa-nuts hanging over the heads of the workmen, were as safe as those in the middle of the island. We caught a large quantity of fish, and were tolerably well supplied by the natives with fruit and roots; and should certainly have obtained more refreshments, had we had any thing on board that suited their taste. Our cloth was of no use to those who go naked, and they had not any knowledge of the utility of iron. Though the people of this island, after feeling the effects of the European fire arms, were peaceable, they were not in general friendly; nor were they like the Indians in the Society Isles, fond of iron: they wished for some of the tools with which they saw our seamen cut down wood; but, except an adze or two, they never attempted to steal any thing. The coopers left their calks during the night un-

guarded; nor were they under any apprehensions about their cloaths, which they suffered to lie carelessly here and there while they were at work. These people discovered none of that disposition to thievery which it has been said every Indian inherits naturally. In their course of trade, they totally disregarded beads and baubles, and seemed to prefer Rotterdam fish-hooks, and turtle-shell, to every thing else that was offered them. They would not permit the sailors to have any communication with their wives; nor were they easily persuaded to part with their arms on any account. The produce of the island they freely parted with, not requiring any thing in return; but on whatever was bestowed labour in the construction, they set a high value.

This island of Tanna produces abundance of plantains, cocoa-nuts, bread fruit, yams, a kind of potatoe, a fruit like a nectarine, wild figs, sugar-cane, and a fruit not unlike an orange, but which is never eaten. The bread fruit, cocoa-nuts, and plantains, are neither so plentiful, nor so good, as at Otaheite; but sugar-canes and yams are of superior quality, and much larger. We saw here a few fowls, and a great number of hogs, but the latter did not fall to our lot; and we did not see in all our excursions any other domestic animals. We met with some small birds, with a most beautiful plumage, which we had never seen before. Our botanists found many curious plants and trees; as great a variety as at any island we had visited. The inhabitants appear to subsist chiefly on the productions of the land, and are not much indebted to the sea, though there are plenty of fish on the coast. We never found any fishing tackle among them, nor saw any one out a fishing, except on the shoals, or along the shores of the harbour, where they would strike with a dart such fish as came within their reach, and in this art they were very expert. They were surprized at our method of catching fish with the seine, and, we believe were not well pleased with our success. The small isle of Immer was chiefly inhabited by fishermen, and the canoes we saw pass to and from the isle, and the east point of the harbour, we observed were fishing canoes. These were of unequal sizes, and composed of several pieces of wood clumsily sewed together. The joints are covered on the outside by a thin batten champered off at the edges, over which the bandages pass. The sail is latteen, extended to a yard and boom, and hoisted to a short mast. Some of the large canoes have two sails, and all of them out-riggers. They are navigated either by paddles or sails.

These people have little resemblance or affinity to those of the Friendly Islands, and those of Mallicollo, except in their hair, which is much like what the people of the latter island have. The colours are black and brown, growing to a tolerable length and curly. They part it into small locks, which they cue round with the rind of a slender plant, down to about an inch of the ends. Each of these locks is somewhat thicker than the common whip-cord; and they appear like a parcel of small strings hanging down from the crowns of their heads. Their beards are generally short, strong and bushy. The women wear their hair cropped, as do the boys, till they approach manhood.

We took some pains to discover how far their geographical knowledge extended, and found it not to exceed the limits of their horizon. To Erronan we may ascribe one of the two languages they speak, which is nearly, if not exactly, the same as that spoke at the Friendly Islands. It is therefore probable, that by a long intercourse with Tanna, and the other neighbouring islands, each hath learnt the others language, which they speak indiscriminately. The other language which the people of Tanna, Erromango, and Annatom speak, is properly their own. It is different from any we had before met with, and bears no affinity to that of Mallicollo; from whence we conclude, that the natives of these islands are a distinct nation of themselves. Mallicollo, Apee, &c. were names unknown to them; they even knew nothing of Sandwich Island, which is much the nearer. These people are rather slender made,

A MAN of the ISLAND of TANNA.

London: Printed by A. MILLAR, in Pall-mall; and by J. JOHNSON, in St. Paul's Church-yard.

A WOMAN of the ISLAND of TANNA.

made, and of the middle size. They have agreeable countenances, good features, and are very active and nimble, like the other tropical inhabitants. The females are put to all laborious works; and the men walk unconcerned by their side, when they are loaded with heavy burdens, besides a child at the back. Perhaps the men think, that their carrying their arms, and defending them, is sufficient. We often saw large parties of women carrying various kinds of articles, and a party of men armed with clubs and spears to defend them, though now and then we have seen a man carry a burden at the same time, but not often. The women of Tanna are not very beautiful, yet they are certainly handsome enough for the men, who put them to all kinds of drudgery. Though both men and women are dark coloured, they are not black, nor do they bear any resemblance to negroes. They make themselves blacker than they really are, by painting their faces of the colour of black-lead. They use also a sort of pigment which is red, and a third sort brown, all these, especially the first, they lay on with a liberal hand, not only on the face, but on the neck, shoulders, and breast. The women wear a petticoat made of leaves, and the men nothing but a belt and wrapper. Bracelets, earrings, and amulets, are indiscriminately worn by both sexes. The amulets are made of the green stone of Zealand; the bracelets of sea-shells or cocoa-nut; and the necklaces, chiefly worn by the women, mostly of sea-shells. The valuable ear-rings are made of tortoiseshell. Some of our people having got some at the Friendly Islands, brought it to a good market here, where it was more esteemed than any thing we offered to sale. Hence we concluded these people caught but few turtle, though one was seen just as we got under sail. Towards the time of our departure, the natives began to enquire after hatchets and large nails; from which we concluded, that they had found iron to be of more value and use than stone, shells, or bones, of which their tools are made. Their stone hatchets are not shaped like an adze, as in the other islands, but more like an ax; and in the helve, which is pretty thick, is made a hole, into which the stone is fixed.

If we except the cultivation of the ground, these people have few arts worth mentioning. They make a coarse kind of matting, and cloth of the bark of a tree, used chiefly for belts. The workmanship of their canoes is very clumsy; and their arms come far short of others we had seen. Their weapons are bows, arrows, stones, clubs, spears, and darts. On the last they place most dependence, and these are pointed with three bearded edges. In throwing them, they make use of a becket, that is a piece of stiff plaited cord about six inches long, with an eye at one end, and a knot at the other. The eye is fixed on the fore finger of the right-hand, and the other end is hitched round the dart, where it is nearly on an equipoise. They hold the dart between the thumb and remaining fingers, which serve only to give it direction, the velocity being communicated by the becket and fore finger. The former flies off from the dart the instant its velocity becomes greater than that of the hand, but it remains on the finger ready to be used again. They kill both birds and fish with darts, and are pretty certain of hitting the mark, within the compass of a crown of a hat, suppose the object to be distant eight or ten yards; but if twice that distance, it is chance if they hit a mark the size of a man's body, though they will throw the weapon 60 or 70 yards; for they always throw with all their might, let the distance be what it may. Their arrows are made of reeds pointed with hard wood. Some are bearded; some not; and those for shooting birds have two, three, and four points. The stones in general, are branches of coral rocks, from eight to fourteen inches long, and from an inch to an inch and a half diameter. These are generally kept in their belts. Every one carries a club, and besides that, either darts, or a bow and arrows, but never both. One of our gentlemen on board, made the following remark on the arms of these people, which we shall here insert in his own words. "I must confess, I have often been led to

think the feats which Homer represents his heroes as performing with their spears, a little too much of the marvellous to be admitted into an heroic poem; I mean when confined within the strait stays of Aristotle. Nay, even so great an advocate for him as Mr. Pope, acknowledges them to be surprizing. But since I have seen what these people can do with their wooden spears, and those badly pointed, and not of a very hard nature, I have not the least exception to any one passage in that great poet on this account. But if I see fewer exceptions, I can find infinitely more beauties in him; as he has, I think, scarcely an action, circumstance, or description of any kind whatever, relating to a spear, which I have not seen and recognised among these people; as the whirling motion, and whistling noise, as the spears fly; their quivering motion, as they stick in the ground; the warriors meditating their aim, when they are going to throw; and their shaking them in their hand, or brandishing them, as they advance to the attack, &c."

As to the religion and government of these people, we are little acquainted with the last, and to the first are utter strangers. Chiefs they seem to have among them; at least some were announced to us as such, but they appeared to have very little authority over the rest of the people. Old Geogy was the only one to whom we saw a particular respect paid; but whether this was owing to his rank or age, we cannot say. On many occasions we have seen the old men respected and obeyed. Paowang was so, yet we never heard him called chief, nor could we perceive he had any more power than his neighbours, and we may say the same of every other person in our neighbourhood.

The Resolution being the first ship that ever entered this harbour, Capt. Cook named it Port Resolution. It is situated on the north side of the most eastern point of the island, and about E. N. E. from the volcano, in latitude 19 deg. 32 min. 25 sec. and half south, and in 169 deg. 44 min. 35 sec. east longitude. It is but a small creek, running in S. by W. half W. three quarters of a mile, and is about half that in breadth. The depth of water in the harbour is about six to three fathoms, the bottom sand and mud. The landing place is exceeding convenient for taking in wood and water, both of these necessary articles being near the shore. After the water had been a few days on board it stunk, but turned sweet again; and when at the worst the tin machine would, in a few hours, recover a whole cask. We now stretched, with a fresh gale, to the eastward, in order to have a nearer view of Erromang. Having passed this island at midnight, we tacked, and on Sunday the 21st, steered S. W. intending to get to the south of Tanna, and nearer Annatom; for though the morning was clear, we had made no discovery of any islands to the east. At noon, in latitude 20 deg. 33 min. 30 sec. Port Resolution bore north, 86 deg. west, distant about 18 miles: Tanna extended from south, 88 deg. W. to N. 64 deg. W. Traitors Head north 58 deg. W. distant 60 miles; the island of Erromang, north, 86 deg. E. distant 15 miles; and Annatom from S. half E. to S. half W. distant 30 miles. At two o'clock P. M. seeing no more land ahead of us, we bore up round the S. E. end of Tanna, and ran along the south coast at one league from shore. It seemed to be a bold one unguarded by rocks, and the country made a fine appearance, full as fertile as that in the vicinity of the harbour. At six o'clock we saw over the west end of Tanna, in the direction of north 16 deg. W. the high land of Erromang. We passed the island at eight, and shaped our course for Sandwich Isle, in order to complete our observations on that, and of the isles to the N. W. At four o'clock P. M. we approached the S. E. end. We found it to trend in the direction of W. N. W. In the middle of this range, very near the shore, we discovered three or four small isles, behind which appeared a safe anchorage. We continued our run along the coast to its western extremity and then steered N. N. W. from the S. E. end of Mallicello.

On the 23d, we came in sight of the islands Pa-oom, Apce, and Ambrym. The first of these appeared now

to be two islands. We continued our course to within half a league of Mallicollo, on the S. W. side, which we ranged at that distance. The direction of the land, from the S. E. point is W. by S. for about six leagues, and then N. W. by W. for three leagues, terminating in a high point or head land, in latitude 16 deg. 29 min. to which the name was given of S. W. Cape. The coast is low, indented with creeks, and projecting points; but, probably, these points might be little isles under shore. One we know to be such, lying between two and three leagues of the cape. A round rock, or islet, which, by an elbow in the coast, forms a fine bay, lies close to the west side, or point of the cape, connected with it by breakers. We were agreeably surprized with the beauty of the forests in Mallicollo, from whence we saw smoke ascend in various places, a plain indication of their being inhabited: the circumjacent land appeared very fertile and populous. We observed troops of natives on several parts of the shore; and two canoes put off to us, but as we did not shorten sail, they could not overtake the ship. The most advanced land from the S. W. cape, bore N. W. by N. at which it seemed to terminate. At noon we were two miles from the coast, and by observation we found our latitude to be 16 deg. 22 min. 30 sec. S. and our never failing watch shewed, that we were 26 min. W. of it. At this time the S. W. cape bore S. 26 deg. E. and the most advanced point of land for which we steered, bore N. W. by N. We had run the length of it by three o'clock P. M. and found the land trending more and more to the north. We reached its utmost extremity after dark, when we were near enough the shore to hear the voices of the people, who were assembled round a fire they had made on the beach. We now hauled round the point, stood again to the north, and spent the night in Bougainville's passage, being assured of our situation before sun-set.

On Wednesday, the 24th, we had advanced nearly to the middle of the passage, and the N. W. end of Mallicollo extended from S. 30 deg. E. to S. 58 deg. W. We now steered N. by E. then north along the east coast of the northern land. At first this coast appeared continued, but we found it was composed of several low woody isles, most of them of small extent, except the southermost, which in honour to the day, was named St. Bartholomew. It is near seven leagues in circumference, and forms the N. E. point of Bougainville's passage. We continued our course N. N. W. along a fine coast covered with woods; in some places were white patches which we judged to be chalk. On the 25th, at day break, we were on the north side of the island, and steered west along the low land under it, for the bluff-head; beyond which, at sun rise, we saw an elevated coast, stretching to the north, as far as N. W. by W. Having doubled the head, we perceived the land to trend south, a little easterly, and to form a large deep bay, bounded on the west by the above mentioned coast. It was our opinion, and every thing conspired to make us conclude, that this was the bay of St. Philip and St. Jago, discovered by Quiros in 1606. In order to determine this point, we stretched over to the west shore, from which we were one league at noon, and in latitude 14 deg. 55 min. 30 sec. S. and in 167 deg. 3 min. E. At half past four o'clock P. M. we were only two miles from the west shore, to which we had been drove by a N. E. swell. Here we saw large bodies of the natives collected together. Some ventured off in canoes; but they took sudden fright at something, nor could all our signs of friendship induce them to come along-side. Their nakedness was covered with some flag-grass, fastened to a belt, and which hung down, nearly as low as their knees: this was their only covering. Their complexion was very dark and their hair woolly, or cut short. The calm continued till near eight o'clock, and in the interval of time, we were drove into eighty-five fathom water; so that we were under the apprehensions of being obliged to anchor on a lee shore, in a great depth, and in a gloomy dark night; but contrary to our expectations our fears were removed; for a breeze sprung up

at E. S. E. and when we had hardly room to veer, the ship came about; our sails filled on the starboard tack; and we (such was the kind interposition of an invisible agent) stood off N. E. On the 26th, we were about eight miles from the head of the bay, that is terminated by a low beach; behind which is an extensive flat covered with wood, and bounded on each side by a ridge of mountains. We found our latitude at noon to be 15 deg. 5 min. S. and at one o'clock, having a breeze at N. by W. we steered up to within two miles of the head of the bay. Mr. Cooper and Mr. Gilbert were sent out to sound and reconnoitre, while we stood off and on with the ship. By this, time and opportunity were afforded for three sailing canoes to come up, which had been following us. They would not come along-side, but advanced near enough to receive such things as were thrown out to them, fastened to a rope. They appeared to be of the same colour as the inhabitants of Mallicollo, but were stouter made and taller: their beards were frizzled and their hair woolly: yet several circumstances concurred to make us think they were of another nation. The numerals, as far as six, they expressed in the language Anamocha, and called the adjacent lands by the same names. Some had their hair long, tied upon the crown of the head, and ornamented with feathers like the New Zealanders. Others wore a white shell tied on their foreheads. They wore bracelets on their arms, and a belt round their waists. Some were painted with a blackish pigment. They had prongs with them, which looked like instruments to catch fish, and the only arms we saw among them were gigs and darts. Their canoes were most like those of Tanna, and navigated in much the same manner. They gave us the names of such parts as we pointed to; but the name of the island we could not get from them. On the return of the boats we were informed by Mr. Cooper and others, that they had landed at the head of the bay, near a fine stream of fresh water. We steered down the bay, being not in want of any thing, and the wind having shifted to S. S. E. Throughout the fore part of the night, on the west side of the shore, the country was illuminated with fires, from the sea shore to the summit of the mountains. On Saturday the 27th, at day-break, we found ourselves two thirds down the bay, and at noon we were the length of the N. W. point, which bore N. 82 deg. W. distant five miles; and by observation our latitude was 14 deg. 39 min. 30 sec. Some of our gentlemen were doubtful of this being the bay of St. Philip and St. Jago, because no place answered to the port of Vera Cruz; but the captain gave very good reasons for a contrary opinion. A port is a very vague term, like many others in geography; and what Quiros calls the port of Vera Cruz, might be the whole haven or harbour, or the anchorage at the head of the bay, which in some places may extend farther off than where our boats landed. The river was probably one of those mentioned by Quiros, and, if we were not deceived, we saw the other.

The bay is every where free from danger, and of an unfathomable depth, except near the shores, which are for the most part low. It hath sixty miles sea coast; eighteen on the east side, which lies in the direction of S. half W. and N. half E. six at the head; and thirty-six on the west side, the direction of which is S. by E. and N. by W. from the head down to two thirds of its length, and then N. W. by N. to the N. W. point. The two points which form the entrance of the bay, are in the direction of S. 53 deg. E. and N. 53 deg. W. distant from each other thirty miles. The bay, as well as the flat land at the head of it, is bounded by a ridge of hills: one to the west is very high, and extends the whole length of the island. Upon this appeared a luxuriant vegetation wherever the eye turned. Rich plantations adorned the sides of the hills, forests reared their towered heads; and every valley was watered with a running stream; but of all the productions of nature the cocoa-nut trees were the most conspicuous. Capt. Cook named the east point of the bay Cape Quiros, in memory of its first discoverer. It is in lat. 14 deg. 56 min. S. and in 167 deg. 13 min. E. longi-

longitude. The N. W. point he named Cape Cumberland, in honour of his royal highness the duke. This lies in latitude of 14 deg. 38 min. 45 sec. S. and in longitude 166 deg. 49 min. 30 sec. E. It is the N. W. extremity of this Archipelago. On the 28th, and 29th, we took every opportunity, when the horizon was clear, to look out for more land, but none was seen: it is probable that there is none nearer than Queen Charlotte's Island, discovered by Capt. Carteret, about 90 leagues N. N. W. from Cape Cumberland, and the Captain thought this to be the same with Quiros's Santa Cruz. On Tuesday the 30th, we plying up the coast with a fresh breeze.

On Wednesday the 31st, we weathered the S. W. point of the island. The coast which trends east, northerly, is low, and seemed to form some creeks or coves; and as we got farther into the passage, we perceived some small low isles lying along it, which seemed to extend behind St. Bartholomew Island. Having now explored the whole Archipelago, the season of the year made it necessary to return to the south; but we had yet some time left to make observations on any land we might discover between this and New Zealand; at which last place the Captain intended to touch, in order to recruit our stock of wood and water for another southern course. To this end, at five o'clock P. M. we tacked, and hauled to the southward, with a fresh gale at S. E. At this time the S. W. point of the island Tierra del Espiritu Santo, the only remains of Quiros's continent, bore north 82 deg. W. which Capt. Cook named Cape Liffburne. It lies in latitude 15 deg. 40 min. and in 165 deg. 59 min. east longitude. It may perhaps be pleasing to our readers to give a summary and more accurate view of the islands in this Archipelago, as the foregoing account, being given journal-wise, may not be thought perspicuous, or plain enough, either as to situation or description.

The islands which compose this Archipelago are not easily numbered. We counted upwards of seventy in sight at one time; and they seem to be inhabited by people of very different natures and complexions. Some we saw were woolly headed, and of the African race; others were of a copper colour, not unlike the New Zealanders; some were of the mulatto colour, and not a few like the natives of Rotterdam, of a brownish black, with long hair and shorn beards. The high notions, however, that were entertained of the vast riches of these islands, of their abounding in pearls, silver ore, and precious stones, do not seem well founded, neither does the island of Manicola answer by any means, the pompous description given of it by the Spanish writers, who found their report on the relation of an Indian chief, and on that of a captive, whom Quiros seized, and carried to Mexico. From the former Quiros learned, that to the N. W. of his country (Taumaco) there were more than 60 islands, and a large country, which he called Manicola; that, to explain which were small, he made circles, and pointed to the sea with his finger, and made signs that it surrounded the land; and for the larger he made greater circles, and the same signs; and for that large country he opened both his arms, without joining them again, thereby intimating, that it extended without end; and by signs he shewed which people were whites, negroes, Indians, and mulattoes, and which were mixed; that in some islands they eat human flesh; and for this he made signs by biting his arm, shewing clearly thereby his abhorrence of such people. He also gave them to understand, that in the great country, there were cows or buffaloes. From the captive Quiros learnt, that in some of those islands, there were pearls as large as small pebbles; that the pearls were white and shining; and that when they looked at them against the sun, the shining lustre dazzled their eyes; that, at five days of their sailing from a country which he named, lay that great country Manicola inhabited by many people, dun-coloured, and mulattoes, who lived in large towns; that the country was high and mountainous, with many large rivers; that he, with many others, had gone to it

No. 20.

in one of their embarkations, in quest of the trunk of a great tree, of the many that are in it, to make a paria-gua; and that he saw there a port larger, and the entrance narrower, than that of St. Philip and St. Jago, and that the bottom was sand, and the shore shingle; he added, that the inhabitants had warlike instruments pointed with silver. This captive, after he had learnt the Spanish tongue, confirmed what he had said of the Great Country, and what the chief had said of the many islands, and of the different nations with which they were peopled; some lusty, having their bodies punctuated; others not so, of various colours, long hair, red, black, curled and woolly. And being shewn some stones impregnated with silver, he said, in the great country he had seen such kind of stones, and likewise at Tuamaco, where the natives used some to punctuate themselves, and others for ornament. From these intimations, several Navigators have inferred, that if Quiros had stood to the southward, that course would have undoubtedly discovered to him the great Southern Continent, or as Quiros emphatically expresses it, "the mother of so many islands." Yet after all, THIS VOYAGE has shewn all these questionable affirmations, and probable conjectures, to be no other than mere assumptions founded on a false hypothesis. The course which Tasman pursued in 1722, joined to that of Capt. Cook's, has demonstrated the non-existence of a Southern Continent, in the direction in which Mr. Dalrymple so positively asserts Quiros might have found it; and indeed every other direction from the line to 50 deg. of southern latitude, between which he has given it a place.

The islands of this Archipelago towards the north, were first discovered by that able navigator Quiros, a Spanish captain, in 1606, and was considered as part of the Southern Continent, which, at that time, was supposed to exist. They were next visited (for the French are very ready to reap the fruits of other peoples labours) by M. de Bougainville in 1768, who except landing on the isle of Lepers, discovered no more than that the land was not connected, but composed of islands, which he called the Great Cyclades. But our great navigator, and experienced commander, Capt. Cook, left no room for conjecture, respecting the great objects he had in view; for besides ascertaining the extent and situation of these islands, he has added to them several new ones; and having explored the whole with mathematical precision, we think he had a right to name them, as he did, the New Hebrides; by which name we shall in the remaining parts of our narrative distinguish them. Their situation is between the latitude of 14 deg. 29 min. and 20 deg. 4 min. S. and between 166 deg. 41 min. and 170 deg. 21 min. E. longitude, extending 125 leagues, or 375 miles, in the direction of N. N. W. half W. and S. S. E. half E. We shall describe them for the sake of perspicuity in the following numerical order:

I. The Peak of the Etoile, as it was named by M. de Bougainville. This is the most northern isle, and, according to his reckoning, lies N. by W. eight leagues from Aurora, in latitude 14 deg. 29 min. longitude 168 deg. 9 min.

II. Tierra del Espiritu Santo, which lies farthest north, and was discovered by Quiros in 1606. This is the most western and largest of all the Hebrides. It lies in the direction of N. N. W. half W. and S. S. E. half E. and is 66 miles long, 36 broad, and 180 in circumference. The land is exceeding high and mountainous; and the hills in many parts rise directly from the sea. Every place, except the cliffs, is beautifully adorned with woods and regular plantations. The bay of St. Philip and St. Jago, forms an excellent harbour, and we doubt not of there being good bays along the south and east coasts of other smaller islands.

III. Mallicollo is the next considerable island, extending N. W. and S. E. In this direction it is 54 miles long. Its greatest breadth is at the S. E. which is 24 miles. The N. W. end is 16 miles broad; and nearer the middle one third of that breadth. These unequal

unequal measurements, particularly near the centre, are caused by a wide and pretty deep bay, on the S. W. side. If we may form a judgment of the whole of this island from what we saw of it, we must conclude it is very fertile and populous. The hills are in the center of the island, from which the land descends, with an easy slope to the sea-coast, where it is rather low.

IV. St. Bartholomew, situated between the S. E. end of Tierra del Espíritu Santo, and the north end of Mallicollo; the distance between which latter island and St. Bartholomew is eight miles. The middle of it is in latitude 15 deg. 48 min. Between this island and that of Mallicollo, is the passage through which M. de Bougainville went; whose descriptions have very little pretensions to accuracy.

V. The Isle of Lepers is situated between Espiritu Santo and Aurora, being distant from the former eight leagues, and from the latter three. It lies nearly under the same meridian as the S. E. end of Mallicollo, in latitude 15 deg. 22 min. Its figure approaches nearest to an oval; and it is near 60 miles in circumference. We determined its bounds by several bearings; but the lines of the shore were traced out by inspection, except the N. E. part, where there is an anchorage half a mile from the land. We must here observe, that, Aurora, Whitfuntide, Ambrym, Paoom, and its neighbours Apee, Three-hills, and Sandwich Islands, lie all under the same meridian of 167 deg. 29 min. E. extending from the latitude of 14 deg. 51 min. 30 sec. to 17 deg. 53 min. 30 sec.

VI. Aurora Island lies N. by W. and S. by E. in which direction it is 33 miles in length; but in breadth, we think, it scarcely exceeds seven miles, except where the natives have their plantations, its surface is hilly, and every where covered with wood.

VII. Whitfuntide Island, one league and a half to the south of Aurora, of which it is the same length, but somewhat broader; and lies in the direction of north and south. Except such parts that seemed to be cultivated, and which are pretty numerous, it appeared considerably high, and covered with wood.

VIII. Ambrym, from the north side to the south end of Whitfuntide Island, is two leagues and an half. In circumference this island is about 17 leagues. The shore is rather low, and the land rises with an unequal ascent to a high mountain. We judged it to be well inhabited from the quantity of smoke which we perceived to ascend out of the woods, in such parts of the island as passed under our observation; for the whole of it we did not see.

IX. Paoom, of this and its neighbourhood we saw but little, and therefore can only say of this island, that it soars up to a great height in the form of a hay-cock. The extent of this and the adjoining isle (if they are two) do not exceed three or four leagues, in any direction; for the distance between Ambrym and Apee is scarcely five leagues, and they are situated in this space, and east from Port Sandwich, distant about eight leagues.

X. Apee. The direction of this island is about 2½ miles N. W. and S. E. and it is not less than 60 miles in circumference. It has a hilly surface, rising to a considerable height, and is diversified with woods and lawns: we speak here only of the west and south parts, for the others we did not see.

XI. Shepherd's Isles, which are a cluster of small ones, of different dimensions, in the direction of S. E. and extending off from the S. E. point of Apee, about five leagues.

XII. Three-hills. This island lies four leagues south from the coast of Apee, and is distant 17 leagues, S. E. half S. from Port Sandwich. A reef of rocks, on which the sea continually beats, lies W. by N. five miles from the west point.

XIII. Sandwich Island is situated nine leagues, in the direction of south from Three-hills. To the east and west of which line are,

XIV. Two-hills Island,

XV. The Monument.

XVI. Montagu Islands.

XVII. Hinchinbrook.

XVIII. Two or three small isles, lying between Hinchinbrook and Sandwich Island, to which they are connected by breakers. Sandwich Island is 75 miles in circumference, and its greatest extent is 30 miles. It lies in the direction of N. W. by W. and S. E. by E. We viewed the N. W. coast of this island only at a distance. From the south end of Mallicollo, to the N. W. end of Sandwich Isle, the distance, in the direction of S. S. E. is 22 leagues.

XIX. Erramango lies in the same direction; and is situated 18 leagues from Sandwich Island. It is about 75 miles in circumference. The middle of it is in latitude 18 deg. 54 min. longitude 169 deg. 19 min. E. From the distance we were off when we first saw it, it appeared of a good height.

XX. Tanna. This island is situated six leagues from the south side of Erramango, extending S. E. by S. and N. W. by N. It is about 24 miles long in that direction, and every where about nine or twelve miles broad.

XXI. Annatom. This is the southernmost island, and lies in latitude 20 deg. 3 min. longitude 170 deg. 4 min. and 12 leagues from Port Resolution, south 30 deg. E. Its surface is hilly, and of a tolerable height; more we cannot say of it.

XXII. Immer, which is in the direction of N. by E. half E. four leagues from Port Resolution in Tanna; and,

XXIII. Erronan, or Footoona, east, lies in the same direction, distant 11 leagues. This island is the most eastern of all the Hebrides, and appeared to be more than five leagues in circumference. It is high, and on the top flat. A small peak, seemingly disjoined from the isle, though we thought it was connected by low land, lies on the N. E. side. This is an accurate description of the principal islands in the Archipelago, to which our commander gave the name of the Hebrides; but, as we have before observed, there are many others of lesser note, of which we had only a transient view, and therefore cannot pretend to describe.

To this account, in order to render it complete, we shall annex the lunar observations, made by our astronomer, Mr. Wales, for ascertaining the longitude of these islands, concerning which Capt. Cook observes, "That each set of observations consisting of between six and ten observed distances of the sun and moon, or moon and stars, the whole number amounts to several hundreds; and these, by means of the watch, have been reduced to all the islands; so that the longitude of each is as well determined as that of the two ports undermentioned, namely, Sandwich and Resolution. To prove this we need only observe, that the longitude of the two ports, as pointed out by the watch and by the observations, did not differ two miles. This shews likewise, what degree of accuracy these observations are capable of, when multiplied to a considerable number, made with different instruments, and with the sun and stars, or both sides of the moon. By this last method, the errors which may be either in the instruments or lunar tables, destroy each other, as also those that may arise from the observer himself; for some are more critical, and closer observers than others. If we consider the number of observations that may be obtained in the course of a month, (supposing the weather to be favourable) we shall perhaps find this method of ascertaining the longitude of places as accurate as most others; at least it is the most easy, and attended with the least expence. Every ship bound to foreign parts is, or may be, supplied upon easy terms, with a sufficient number of good quadrants, proper for making the solar or lunar observations; and the difference of the price between a good and bad quadrant, can never be an object with an officer. The most expensive article, and what is in some measure necessary, in order to arrive at the utmost accuracy, is a good watch; but for common use, and where that strict accuracy is not required, this may be dispensed with;

with; and it is to be observed, that the ordinary way of finding the longitude by a quadrant, is not so difficult but that any man with proper application, and a little practice, may soon learn to make observations as well as the astronomers. Indeed, not any material difference has seldom occurred, between the observations made by Mr. Wales, and those made by the officers at the same time.

Lunar Observations made by Mr. WALES,

For ascertaining the longitude of the Hebrides, reduced by the watch to Port Sandwich in Mallicollo, and Port Resolution in Tanna.

I. PORT SANDWICH.

Mean of 10 sets of observ. before	167° 56' 33" $\frac{1}{2}$
2 ditto, at	168 2 37 $\frac{1}{2}$
20 ditto,	167 52 57

20 ditto, after	169 47 22 $\frac{1}{2}$
Mean of these means	169 44 35

C H A P. VII.

New Caledonia discovered—Incidents—The country described—An account of the customs, manners, and arts of the natives—Observations on the coast and some low islands—Remarkable incidents while exploring these—The Resolution is obliged to depart from New Caledonia—This, in Capt. Cook's opinion, is the largest island in the South Pacific Ocean, except New Zealand—Remarks upon it—Continues her voyage to New Zealand—Observations respecting the discovery of Norfolk Island—She arrives at Queen Charlotte's Sound—An account of incidents while the ship lay there.

ON September the 1st, being Thursday, we were out of sight of land, and no more was to be seen. We continued our course to the S. W. and on the 3d at five o'clock, found ourselves in 19 deg. 49 min. and in 165 deg. E. longitude. On the 4th, at eight o'clock A. M. we discovered land, which at noon extended from S. S. E. to W. by S. distant six leagues. At five P. M. we were six leagues off, when we were stopped by a calm. At this time the land extended from S. E. by S. to W. by N. round by the S. W. but as some openings were seen in the west, we could not determine whether it was one connected land, or a cluster of Islands. The coast to the S. E. seemed to terminate to the S. E. in a high promontory, which was named Cape Colnett, after one of our midshipmen, who first discovered this land. We saw two or three canoes under sail, and we thought they had come off to us, but they struck their sails a little before sun set, and we saw them no more. On the 5th, we observed the coast extended to the S. E. of Cape Colnett, and round by the S. W. to N. W. by W. We bore down to N. W. and came before an opening, that had the appearance of a good channel. We desired to enter it, in order to have an opportunity of observing an eclipse of the sun, which was soon to happen. We therefore sent out two armed boats to sound the channel; and at the same time we saw 12 large sailing canoes near us. All the morning we had observed them in motion, and coming off from different parts; but some were lying on the reef, fishing as we imagined. When we hoisted out our boats they were pretty near us; but upon seeing this, they returned, and our boats followed them. We now were convinced, that what we had taken for openings in the coast was low land, all connected, except the western extremity, which, as we afterwards learnt, was an island, called Balabea. The boats having made a signal for a channel, we stood in with the ship. The commanding officer of the boats reported, that there was good anchorage, and that the natives were very civil and obliging. He gave them some medals, and in return, they presented him with some fish. Having got within the reef, we hauled up S. half E. for a small low sandy isle, lying under the shore, being followed by all the canoes. We proceeded up the bay more than two miles, and at length anchored in five fathoms water, the bottom a fine sand mixed with mud, and we were well sheltered from the wind and sea. At this time the low sandy isle bore E. by S. distant three quarters of a mile, and from the shore of the main we were one mile. The island of Balabea bore N. W. by N. and the channel through which we came north, distant four miles. A great number of the natives sur-

rounded us before we had well got to anchor, in 16 or 18 canoes, without any sort of weapons, and we prevailed upon one boat to come near enough to receive some presents. In return, they tied two fish to the rope, that stunk intolerably. An intercourse being thus opened by mutual exchanges, two of the natives ventured on board the ship, and presently after she was filled with them. Some dined with us, but they would not eat our salt beef, pork, or pease soup: we happened to have some yams left which they were very fond of. These they called Oobee, a name not unlike Oofee by which they are called at most of the islands, except Mallicollo; nevertheless we found these people spoke a language to which we were entire strangers. They were quite naked, except the belt and wrapper, which they used as the inhabitants of the other islands. They had no knowledge of our dogs, cats, and goats, &c. not having even a name for them; but they shewed a remarkable attachment to pieces of red cloth and spike nails. After dinner-time, a party of us went ashore with two armed boats, and landed amidst a great number of people, who were induced by curiosity alone to see us, for they had not so much as a stick in their hands, and received us with great courtesy. They expressed a natural surprize at seeing men and things so new to them as we were. Presents were made to such, as a man, who had attached himself to Capt. Cook, pointed out; but he would not suffer the captain to give the women, who stood behind, any beads or medals. We saw a chief whose name was Teabooma, who called for silence soon after we landed. Every person instantly obeyed him, and listened with extraordinary attention. When he had finished his harangue, another spoke, who was no less respectfully attended to. Their speeches were composed of short sentences. We thought ourselves to be the subject of them, though we could not understand them. Having by signs enquired for fresh water, some pointed to the east, others to the west; but our friend undertook to conduct us to it, and for that purpose embarked with us. The ground we passed was beautifully cultivated, laid out in several plantations, and well watered. We rowed near two miles to the east, where we observed the shore to be mostly covered with mangroves. We entered among these by a narrow creek or river, which brought us to a little straggling village where we were shewn fresh water. Near this spot the land was richly adorned with plantations of sugar-canes, yams, &c. and watered with little rills, conducted by art from the main springs, whose source was in the hills. We saw several coconut trees which had not much fruit on them, and heard the crowing of cocks, but saw none. Some roots were baking

baking on a fire, in an earthen jar, which would hold six gallons, and we did not doubt, but that this was of their own manufacture. Mr. Forster shot a duck as it flew over our heads, and explained to the captain's friend how it was killed. He desired to have the duck, and informed his countrymen in what manner it was shot. The tide not permitting us to stay longer in the creek, we took leave of these amicable people, from whom we had nothing to expect but good nature, and the privilege of visiting their country without molestation, as it was easy to see these were all they could bestow. Though this did not satisfy our demands, it gave us much ease and satisfaction, for they certainly excelled all the natives we had hitherto met with in friendly civility.

On Tuesday, the 6th, in the morning, hundreds of the natives came to visit us: some swam, and others came in canoes. Before ten o'clock our decks, and other parts of the ship, were quite full of them. The captain's friend brought some fruit and a few roots: the rest had with them only their clubs and darts, which they exchanged readily for nails, pieces of cloth, and other trifling articles. Teabooma came with them, but went out of the ship imperceptibly, and by that means lost the present that was intended for him. After breakfast lieutenant Pickersgill was sent with two armed boats in search after fresh water, for what was found the preceding day could not conveniently be got on board. Mr. Wales also, and lieutenant Clerke, went to the little island, to make preparations for observing the eclipse of the sun, which was expected to be in the afternoon. Mr. Pickersgill having succeeded, soon returned. The launch was therefore ordered out to complete our water, and the captain repaired to the isle, to assist in the observation. The eclipse came on about one o'clock P. M. We lost the first contact by intervening clouds, but were more fortunate in the end; and by observations taken with different instruments, by Capt. Cook, Mr. Wales, and Mr. Clerke, the latitude of the isle, at the place of observation, was found to be 20 deg. 17 min. 39 sec. S. The longitude by the distance of the sun and moon, and moon and stars, 48 sets, 164 deg. 41 min. 21 sec. E. The same by the watch 163 deg. 58 min. Mr. Wales measured the quantity eclipsed by Hadley's quadrant, a method never before thought of. The captain was of opinion, that it answers the purpose of a micrometer to a great degree of certainty: if so, it is a great addition to the use of this valuable instrument. In the evening we visited the watering place, which was a fine stream, at the head of a small creek. The casks were conveyed by a small boat down the creek to the beach, over which they were rolled, and then put into the launch. The boat could enter the creek only at high water. Near this watering place was plenty of excellent wood for fuel, an article we did not at present want. In the evening of this day, about seven o'clock, died Simon Monk, our butcher. His death was occasioned by a fall down the fore hatchway, the preceding night. We could not but lament the loss of so useful a hand, especially as he was well respected and much esteemed on board the ship.

On Wednesday, the 7th, we made a party to take a view of the country. When we had landed, two of the natives undertook to be our guides. We ascended the hills by a pretty good path; and in the way met several people, who accompanied us, so that in a short time our train became numerous. From the summit of one of the hills we saw the sea in two places, whereby we could determine the breadth of this country, which does not exceed thirty miles. A large valley lay between the ridge we were upon, and the advanced hills, through which glided a serpentine river, and on the sides of the hills were several straggling villages. The valley appeared rather romantic, by the villages, interspersed with woods, winding streams, and beautiful plantations, which much improved the scene. The other parts of the island were mostly rocky and barren. The little soil that is upon the mountains and high places is burnt up by the sun; yet it is coated with

coarse grafs and plants, and here and there trees and shrubs. There is a great similitude between this country and New Holland, under the same parallel of latitude, obvious to every one who had seen both places. We returned by a different road to that we came by, and passed through some of the plantations in the plains, which were laid out with great judgment, and appeared to be well cultivated. All the nations in these seas recruit their land by letting it lay in fallow, but they seem not to have any idea of manuring it, except by setting fire to the grafs with which it is over-run. Having finished our excursion by noon, we returned on board to dinner, with one of our guides with us, whose attention and fidelity were rewarded at a very trifling expence. In the afternoon, the captain's clerk, being ashore, purchased a fish which one of the natives had struck. It had a large, long, ugly head, and bore some resemblance to the sun fish. It was ordered for supper, as we had no suspicion of its being poisonous. Providentially, the time the draughtsman took up in portraying this fish, made it too late for us to have it dressed; but the captain, and the two Messrs. Forsters tasted of the liver and row; and in the middle of the night, they found themselves seized with a weakness and stupor, which affected their whole frame. The captain had almost lost his sense of feeling, not being able to distinguish between light and heavy bodies; a quart pot and a feather seemed the same in his hand. An emetic, and after that a sweat, were taken by these gentlemen, which proved an efficacious remedy. When they rose in the morning, they found one of the pigs dead, who had eaten the entrails; and when the natives came on board, and saw the fish hang up, they expressed their abhorrence, signifying it was not wholesome food. It is a little remarkable they did not do this when the fish was to be sold, nor after it was purchased. On the 8th in the afternoon, Teabooma, the chief, brought a present to the captain, consisting of a few yams, and sugar canes. In return for which, among other articles, a dog and bitch was sent him, nearly full grown. The dog was red and white, but the bitch was the colour of an English fox. This was done with the view of stocking the country with this species of animals. It was some time before Teabooma could believe the present was intended for him; but when he was convinced of this, he sent them immediately away, and seemed lost in excess of joy. On the 9th, lieutenant Pickersgill and Mr. Gilbert were dispatched in the launch and cutter to explore the coast to the west, which could not be so well effected by the ship, on account of the reefs. A party of men was also sent ashore to cut brooms; but Capt. Cook and Messrs. Forsters were confined aboard, though much better. On the 10th, Mr. Forster was so well recovered as to go into the country in search of plants. On Sunday, the 11th, in the evening, the boats returned, and we were informed by the commanding officers, that having reached an elevation the morning they had set out, they had from thence a view of the coast; and both Mr. Gilbert and Mr. Pickersgill were of opinion, that there was no passage for the ship to the west. From this place, accompanied by two of the natives, they went to Balabea. They were received by Teabi, the chief of the island, and the people who came in great numbers to see them, with strong intimations of friendship. Our people, that they might not be crowded, drew a line between them and the natives, who understood and complied with the restriction. One of these had a few cocoa-nuts, which a sailor would have bought, but the man being unwilling to part with them, walked off, and, being followed by the sailor, he sat down on the sand, made a circle round him, as he had seen our people do, and signified that the other was not to come within it, and the injunction was strictly observed. This excursion to Balabea was rather a fruitless one; for they did not reach the isle till near sunset, and left it again before sun-rise, the next morning; and the two following days were spent in getting up to the ship. In going down to the isle, they saw a great number of turtles, but could not strike any, the

wind and sea being rather tempestuous. The cutter sprung a leak, and suddenly filled with water, so that they were obliged to throw several things over board, to prevent her being lost, and by lightening her, to stop the leak. From a fishing canoe they met, they got as much fish as they could eat.

On Monday, the 12th, early in the morning, the carpenter was ordered to repair the cutter. The captain being desirous of stocking this country with hogs as well as dogs, the former being more useful of the two, he took with them in the boat a young boar and sow, and went up the mangrove creek in search of his friend, the chief, in order to give them to him. We were informed by the natives, that he lived at some distance, but they would fend for him: but he not coming as soon as we expected, Capt. Cook resolved to give them to the first man of consequence he might meet with. In consequence of this determination, they were offered to a grave old man, who shook his head, and made signs for us to take them into the boat again. On our refusing to comply, they seemed to hold a consultation what was to be done. After this, our guide offered to conduct us to the chief, (or Areekee) and he accordingly led us to a house, where eight or ten middle aged persons were seated in a circle. To these the captain and his pigs were formally introduced. They desired the captain with great courtesy to be seated, who began to expatiate on the merits of his two pigs, explaining to them their nature and use, and how they would multiply: in short, he enhanced their value as much as possible, that they might take the more care of them. In return for our present we had six yams brought us, after which we went on board. In the afternoon we made a trip to the shore, and on a tree near the watering place, an inscription was cut, setting forth the ship's name, date, &c. as a memorial and proof that we were the first discoverers of this country. Much the same had been done in other places we had touched at. Near this place is a little village, which we now found to be much larger than we expected. It was surrounded with good cultivated land, regularly laid out, planted, or planting, with taro or eddy root, yams, &c. small rills, in pleasing meanders, continually watered the taro plantations. These roots are planted, some in square or oblong patches, which lie horizontal, and are sunk below the level of the adjacent land, by which means they can let into them, as much water as they think requisite. Others are planted in ridges, about four feet broad, and three high. On the top of the ridge is a narrow gutter, for conveying the little rills to the roots. The plantations are laid out with such judgment, that the same stream waters several ridges. These are sometimes the boundaries to the horizontal plantations, and where this method is used, which is frequently done for the benefit of a pathway, not an inch of ground is lost. Some of the roots are better tasted than others; nor are they all of the same colour; but they are all wholesome food. The tops are eaten by the natives, and we thought them good greens. The whole family, men, women, and children, work in these plantations. Having now fully satisfied our curiosity for the present, we returned on board, when the captain ordered all the boats to be hoisted in, that we might be ready to set sail, and put to sea.

The inhabitants of this country are strong, robust, active, friendly, courteous, and not addicted to pilfering, as all other nations are in this sea. They have in general better features than the natives of Tanna, and are a much stouter race; but in some we saw a resemblance of the negroes, having thick lips, flat noses, and full cheeks. Their hair and beards are black. The former is very rough and frizzled; and frequently wants scratching, for which they have a well contrived instrument, wearing it always in their rough mop heads. It is a kind of comb made of sticks of hard wood, from seven to nine inches long, and about the thickness of a knitting needle. Twenty of these, sometimes fewer, are fastened together at one end, parallel to, and nearly one tenth of an inch from each other.

No. 21.

The other ends, that are a little pointed, spread out like the sticks of a fan. Some have their hair tied up in clubs, and others, as well as the women, wear it cropped short. They also wear their beards cropped in the same manner. They are much subject to swelled and ulcerated legs, particularly the men, as also to a swelling of the scrotum. When they go out in their canoes, and when unemployed, they wear a coarse kind of matting, of their own manufacture, and the men of note have a stiff, cylindrical black cap, which appeared to be a capital ornament, and mark of distinction among them. The dress of their women is a short petticoat, made of the leaves of the plantain tree, fastened by a cord round their waists. This is at least six inches thick, but not one longer than necessary for the use designed. The outer filaments are dyed black, and the right side is ornamented with pearl oyster-shells. Both sexes are adorned with ear-rings, necklaces, amulets, and bracelets, made of large shells, which are placed above the elbow. Various parts of their bodies are punctured. They appear to be a race between the natives of Tanna, and those of the Friendly Islands, and they bear some resemblance to those of New Zealand; their language, in some respects, appears to be collected from these three countries. In honesty and a friendly disposition, they certainly excel all others. However, notwithstanding this, they must sometimes be engaged in war, otherwise they would not be so well provided as they are, with weapons of various sorts. Their clubs are near three feet in length, and variously formed, some with heads like an hawk, others with round heads. They are all made very neatly. Their darts and spears are ornamented with carvings. They take some pains to shape the stones for their slings, which are in the form of an egg, only pointed alike at both ends. In striking fish with a dart, they are very dexterous, which we believe is the only method they have of catching them, for we saw neither hooks nor lines in their possession. Their tools are much the same as in the other islands. They build their houses circular, resembling a bee-hive, and full as close and warm; into which they enter by a square opening, just big enough to admit a man upon his knees. The roof is lofty and brought to a point at top; the side walls are five feet and a half high; both roof and sides are covered with thatch, made of coarse long grass. On the top of most of their dwellings is a wooden post, which is generally ornamented either with carving, or shells, or both. Within are platforms for the convenience of laying any thing on, and in some houses are two floors, one above the other. On the floors dry grass is laid, and mats are spread for the principal people to sleep, or sit on. In most of them we found a fire burning, and in some two fire places, but they are very smoaky and hot, having no chimney, nor vent for the smoke but the door; an atmosphere which to Europeans must be very disagreeable, and as to ourselves we could scarcely endure it a moment; but with respect to the natives, the smoke is a necessary evil, as it prevents the mosquitoes from molesting them, and these are very numerous. Their houses are better calculated for a cold than a hot climate; and it is owing to their internal heat, that these people are so chilly when in the open air, and without exercise. We often saw them make little fires at different places, and squat down round them, only to warm themselves. In some particulars their houses are very neat; for besides the ornaments at top, we saw some with carved door-posts. There are not any partitions in them, consequently they cannot have any of our ideas that make privacy necessary. They cook their victuals in the open air, without doors; and the earthen jar, before mentioned, seems to be the only article of their household utensils worth notice. In this they bake their roots and fish. They use three or five stones, in the form of a sugar-loaf, to keep the jars from resting on the fire, and that it may burn the better. On these the jars lie inclined on their sides; and three stones are for one jar, five for two. The stones are fixed in the ground, and their pointed ends are about half a foot above the surface.

2 Y

face. Water is their only liquor, and their subsistence is on fish, roots, and the bark of a certain tree, which last they roast before they chew it. Some of our people seemed to relish the taste of it, which is sweet and insipid. Their fruit-trees do not yield much fruit. Plantains are not in abundance; sugar canes and bread-fruit are very scarce; and the cocoa-nuts are but thinly planted.

Notwithstanding nature has been rather scanty in her favours to the island, it is not thinly peopled on the sea coast, and in the valleys that are capable of cultivation. We saw, it is true, great numbers of the natives every day, but we believe they came from all parts on our account. Down the coast, to the west, there are but few inhabitants, but from the east, they came daily in large bodies, over the mountains, to visit us. We must, however, confess, that what parts of this country we saw, are not fit to support many inhabitants, most of these being barren rocky mountains, the grass growing on which is useless to people who have no cattle. The sea, perhaps, may compensate for the sterility of the land. A coast encircled with reefs and shoals, cannot fail of affording a plentiful supply of fish. Our botanical party did not complain for want of employment. They observed several plants, common to the eastern and northern islands; and, among other productions, discovered the tree, the bark of which, being easily peeled off, is used in the East-Indies for caulking of ships. The bark is soft, white, and ragged; the wood very hard; the leaves long and narrow, in colour, of a pale dead green, and in smell, a fine aromatic. They found also a species of the passion flower, which, we are informed has never before been known to grow wild any where but in America. Of the land birds, which are very numerous, we saw several to us unknown, as a kind of turtle doves, very beautiful, many small birds, and one resembling a crow, though much smaller, and its feathers are tinged with blue. We endeavoured, but in vain, to obtain the name of the whole island; but we got the names of several districts, with those of their chiefs. Balade was the name of the district we were at, and Tea Booma the chief. Tea is a title prefixed to the names of all, or most of their great men. The captain's friend, by way of distinction, called him Tea Cook. Their canoes are very clumsy, though somewhat like those of the Friendly Isles. Most of them are double canoes. They are navigated by one or two latteen sails. The sail is made of pieces of matting; the ropes of the coarse filaments of the plantain tree. They sail well, but are not calculated for rowing or paddling. They are about thirty feet long, and the deck or platform, about twenty-four in length, and ten in breadth. In our traffic with these people, small nails were of little value, nor did they admire beads, looking-glasses, &c. and even a hatchet was not so valuable as a spike nail. Their women here as well as at Tanna, are very chaste, and we never heard, that one of our people ever obtained the least favour from any one of them. Indeed their ladies would sometimes divert themselves by going a little aside with our gentlemen, as if they meant to be kind, and then would in a moment run away laughing at them. These people deposit their dead in the ground. Some of our gentlemen saw a grave, resembling one of Roman tumuli, in which, they were informed lay the remains of a chief, slain in battle. Round his grave spears, darts, and paddles, were stuck upright in the ground.

On Tuesday, the 13th of September, at sun rise, we weighed, and stood for the same channel we came in by. At half past seven we were in the middle of it, when the isle of Balabea bore W. N. W. As soon as we were clear of the reef, we bore up along the outside of it, steering N. W. by W. as it trended. At noon the island of Balabea bore S. by W. distant about four leagues; and at three o'clock P. M. it bore S. by E. half E. From this place the reef inclined to the N. and then to N. W. Advancing to N. W. we raised more land, so that Mr. Gilbert was mistaken, and did not see the extremity of the coast. At five this land

bore W. by N. half N. distant near seven leagues. On the 14th, the reef still trended N. W. along which we steered, with a light breeze, at E. S. E. At noon we had lost sight of Balabea, and at three o'clock, we run by a low sandy isle, the space between which, and the north-westernmost land was strewed with shoals. At sun-set, we could but just see the land, which bore S. W. by S. about ten leagues distant. No land was seen to the westward of this direction; the reef too trended away W. by N. and from the mast-head seemed to terminate in a point; so that every appearance flattered our expectations, and induced us to believe, that we should soon get round the shoals. On the 15th, seeing neither land nor breakers, we bore away N. W. by W. but the shoals still continuing, we plied up for a clear sea to the S. E. by doing which, we did but just weather the point of the reef we had passed the preceding evening. To render our situation the more dangerous, the wind began to fail us; in the afternoon it fell a calm; and we were left to the mercy of a great swell, setting directly for the reef, which was not more than a league from us. The pinnace and cutter were hoisted out to tow the ship, but they were of little service. At seven o'clock, a light air at N. N. E. kept her head to the sea; and on the 16th, at eleven o'clock A. M. we hoisted in the boats, and made sail to S. E. A tide or current had been in our favour all night, and was the cause (under God) of our getting so unexpectedly clear of the shoals. On Tuesday the 20th, at noon, Cape Colnet bore N. 78 deg. W. distant six leagues. From hence the land extended round by the S. to E. S. E. till it was lost in the horizon, and the country appeared variegated with many hills and valleys. We stood in shore till sun-set, when we were about three leagues off. Two small islets lay distant from us five miles, and others lay between us and the shore. The country was mountainous, and had much the same aspect as about Balade. On the 21st, we found ourselves about six leagues from the coast. On the 22d, we stood in for the land, which at noon extended from N. 78 deg. W. to S. 31 deg. half E. round by the S. The coast, in this last direction, seemed to trend more to the S. in a lofty promontory, which, in honour of the day, was named Cape Coronation, in latitude 22 deg. 2 min. and in 167 deg. 7 min. 30 sec. E. longitude. On the 23d, at day-break, a high point appeared in sight, beyond the cape, which proved to be the S. E. extremity of the coast, to which we gave the name of Queen Charlotte's Foreland. It lies in latitude 22 deg. 16 min. S. and in 167 deg. 14 min. E. longitude. At noon, as we drew near Cape Coronation, we saw in a valley to the south a vast number of elevated objects, from whence a great deal of smoke kept rising all the day. Capt. Cook was of opinion these were a singular sort of trees, being, as he thought, too numerous to resemble any thing else. Some low land under the Foreland was entirely covered with them. The wind having veered round to the south, we tacked, and stood off, not thinking it safe to approach the shore in the dark. We stood in again at day-break, on the 24th, and at noon observed in latitude 21 deg. 59 min. 30 sec. Cape Coronation bearing west, southerly, distant seven leagues, and the North Foreland south, 38 deg. W. At sun-set we discovered a low land, lying S. S. E. about seven miles from the Foreland, surrounded with shoals and breakers.

Sunday the 25th, we stood to S. S. W. with a view of getting round the Foreland, but as we advanced, we perceived more low isles, beyond the one already mentioned. We therefore stood to the south, to look for a passage without these. We got a light breeze at 7 o'clock, which enabled us to steer out E. S. E. and to spend the night with less anxiety. On the 26th, we stretched to the S. E. for an island distant six leagues; and on the 27th, we tacked and stood to S. W. with the hopes of weathering it, but we fell two miles short, which obliged us to tack about a mile from the east side of the island, the extremes bearing from N. W. by N. to S. W. the hill W. and some low isles, lying off the S. E. point, S. by W. These last seemed to be connected with the

large

S. E. P. I. D. N. I. S. I. N. V. I. S. I. O. N. S.

large island by breakers. The skirts of this island were covered with the elevations before mentioned, which had much the appearance of tall pines, and therefore the captain named the island from them. The round hill on the S. W. side may be seen fourteen leagues off. This isle of pines is about a mile in circuit, in latitude 22 deg. 38 min. S. and in 167 deg. 40 min. E. Having made two attempts to weather the island before sun-set, with no better success than before, we stretched off till midnight. On the 28th, at day-break, we found ourselves several leagues to windward of the isle of Pines. The coast from the S. E. round by the south to the west, we saw was strewn with sand banks, breakers, and small low isles. We ranged the outside of these at nearly a league distance, and as we passed some others appeared; so that they seemed to form a chain extending to the isles that lie off the Foreland. In the afternoon, we steered N. W. by W. with a fine gale at east, with a view of falling in with the land; but we discovered two low islets, bearing W. by S. They were connected by breakers, which seemed to join those on our starboard; on which account we found it necessary to haul off S. W. to get clear of them all. At three o'clock P. M. more breakers appeared, which from the mast head were seen to extend as far as east-south; and from the smoothness of the sea, we conjectured, that they might also extend to the north-east; so that we were in a manner surrounded with them. Having made a short trip to N. N. E. we stood again to the south, and again had the alarming sight of a sea full of shoals, which we could only clear by returning in the track we came before. We tacked again nearly in the same place, and then anchored in a strong gale, in a bottom of fine sand, having a chain of breakers to the leeward. We spent the night in making short boards over the known space we had traversed in the day; but under the uneasy apprehensions of being in the most imminent danger. This was very evident on the 29th, at day-light, which shewed our fears were not ill-founded, having had breakers continually under our lee, and at a very little distance from us. The people on the fore-castle and lee gangway, saw breakers under the lee bow, which we avoided by quickly tacking. We now kept a good look out, and managed the ship briskly, but after all the most prudent endeavours on our part, we must ascribe glory to God, being fully convinced, that we owed our safety and preservation, to the interposition of a Divine Providence. Capt. Cook was now inclined to quit this dangerous coast, but, however, he resolved first to see what those trees were, which had been the subject of our speculations, and concerning which many contrary opinions had been maintained. Besides, he thought the discovery might be useful to future navigators. Being now but a few miles distant from the low islands lying off the Foreland, mentioned in our journal on the 25th instant, we bore down to that which was nearest to us. As we approached, we perceived it was unconnected with the neighbouring shoals, and thought we might get to anchor under its west and lee side. Having hauled therefore round the point of the reef, we attempted to ply to windward; but another reef to the north, which formed a narrow channel, through which ran a current against us, rendered this attempt fruitless. We therefore anchored in thirty-nine fathoms water, about a mile from the island, and having hoisted out the boat, sent a party on shore, accompanied by the botanists, who found the trees to be a sort of spruce pines, very proper for spars, of which we were very much in want. The carpenter and his crew, after dinner, were sent ashore, to cut down such trees as would best answer our purpose. While this work was doing, Capt. Cook took down the bearings of the several circumjacent lands, &c. The hill on the isle of pines bore S. 59 deg. 30 min. E. the low point of Queen Charlotte's Foreland north 14 deg. 30 min. W. the high land above it, seen over two low isles, north, 20 deg. W. and the most advanced point of land to the west, bore W. half a point S. distant seven leagues. This point the captain named the Prince of Wales's Foreland. It lies

in latitude 22 deg. 29 min. S. and in 166 deg. 57 min. E. longitude: when first seen above the horizon, by reason of its height, it looks like an island. The true direction of the coast from the Foreland to this point, had been ascertained from several bearings.

On this small Isle, which is not quite a mile in circumference, grew, besides the pines, a variety of other trees, shrubs, and plants; and these having sufficiently employed the botanists during our stay, on this account the captain named the little island Botany Isle. We saw here several pigeons, doves, and water-snakes, different from any we had seen; likewise a hawk of the same kind as our English fishing hawks. A number of fire-places, and some remains of turtle, were signs of people having lately visited this place. In the sand lay the wreck of a canoe, exactly of the same make as those we had seen at Balade; and we now were convinced, that of these pines they made their canoes. Some of these trees measured 20 inches in diameter, were 70 feet long, and would have served very well for a foremast, had we wanted one. As trees of so large a size are the produce of so small a spot, it is reasonable to suppose, that larger ones are the growth of the main. This discovery may be valuable to future navigators; for except New Zealand, we know of no island in the Pacific ocean, where a ship can be supplied with a mast or yard, were she ever so much distressed for want of one. This was the opinion of our carpenter, who was both mast-maker and shipwright in Deptford-yard. These trees shoot out their branches smaller and shorter than other pines, so that when wrought for use their knots disappear. We observed that the largest had the shortest branches, and were crowned at the top with a head like a bulh. The wood is white, close grained, tough, yet light. Turpentine had oozed out of most of the trees, which the sun had formed into resin. This was found adhering to the trunks, and laying about the roots. The seeds are produced in cones. We found here another small tree or shrub, of the spruce fir kind: also a kind of scurvy-grass, and a plant which, when boiled, eat like spinnage. The purpose being answered for which we landed on this island, the captain determined not to hazard the ship down to leeward, but to try to get to the southward of the shoals. The extent of this S. W. coast had been already pretty well determined; a more accurate survey might be attended with great risk and many dangers; it was too late to set up and employ the frame of the little vessel we had on board, and should the Resolution be hemmed in, we might by that means lose the proper season for getting to the south; these reasons induced the Captain to make some trips to weather the shoals to the leeward of Botany Isle. But when this was thought to be effected,

On Friday the 30th, at three o'clock P. M. it fell calm, the swell, assisted by the current, set us fast towards the breakers, which were yet in sight to the S. W. but at ten o'clock a breeze springing up, we steered E. S. E. not venturing farther south till day light.

On Saturday October the 1st, we had a very strong wind at S. S. W. attended by a great sea, so that we had reason to rejoice at having got clear of the shoals before this gale overtook us. We were now obliged to stretch to the S. E. and at noon were out of sight of land.

On the 2d, in the afternoon, we had little wind, and a great swell; but at eleven, a fresh breeze springing up, we stood to the south. We were now in the latitude of 23 deg. 18 min. and in 169 deg. 49 min. E. longitude.

On the 3d, at eight o'clock A. M. we had a strong gale with squalls from the S. W. and the Captain laid aside all thoughts of returning to the land we had left. Nor could such an attempt be thought a prudent one, when we consider, that we had a vast ocean yet to explore to the south; that the ship was already in want of necessary stores; that summer was approaching very fast, and that any considerable accident might detain us from pursuing the great object of this voyage another year. Thus necessity compelled us to leave a coast, for the first time, which we had discovered, but not fully explored.

explored. The captain named it New Caledonia, and in his opinion, it is next to New Zealand, the largest island in the South Pacific Ocean. The extent is from latitude 19 deg. 37 min. to 22 deg. 30 min. S. and from longitude 163 deg. 37 min. to 167 deg. 14 min. E. It lies nearly N. W. half W. and S. E. half E. and is about 87 leagues long, but its breadth does not anywhere exceed 10 leagues. It here must be noted, that in the extent given to this island, is included the broken or unconnected lands to the N. W.

On Thursday the 6th, we continued our course to New Zealand, with this view we sailed S. S. E. having a blowing fresh gale, but at noon it fell calm. At this time we found ourselves by observation, in latitude 27 deg. 50 min. S. and in 171 deg. 43 min. E. longitude. During the calm, which continued all this day, the carpenters were employed in caulking the decks. This was done with varnish of pine, covered with coral sand, as they had neither pitch, tar, nor rosin left. The experiment with respect to the cement, far exceeded their expectations. In the afternoon, two albatrosses were shot, which, at this time, we thought equally good as geese.

On the 7th a breeze sprung up, and fixed at S. E. by S. The day following we had a gentle gale, attended with fine weather. On the 9th we were in latitude 28 deg. 25 min. and in 170 deg. 26 min. E. longitude. In the evening, Mr. Cooper struck a porpoise. It was six feet long, and a female, called by naturalists the dolphin of the ancients, and which differs from the common porpoise in the head and jaw, which are long and pointed. This had 88 teeth in each jaw. It was first soaked in water, then roasted, broiled, and fried. To us who had long subsisted on salt meat, it was more than palatable; and we thought the hacket, and lean flesh, a delicious feast.

On the 10th we discovered land, situated in latitude 29 deg. 2 min. 30 sec. S. and in 168 deg. 16 min. E. longitude. Capt. Cook called it Norfolk Island, in honour of the Howard family, who have the title of the duke of Norfolk. We anchored here in 22 fathoms water, on a bank of coral sand, mixed with broken shells. After dinner, a party of us embarked in two boats, and landed on the island behind some large rocks. It was uninhabited, and we were undoubtedly the first who ever set foot upon it. We observed many trees and plants common to New Zealand, particularly the flax plant, which grows very luxuriant here. We found in great abundance the spruce pine trees, straight and tall, and many of them as thick as two men could fathom. The soil of this island is rich and deep, the woods perfectly clear from underwood, and for about 200 yards from the shore, the ground is covered with shrubs and plants. We found here many sea and land fowl, of the same kind as in New Zealand; likewise cabbage-palm, wood-sorrel, sow-thistle, and samphire. The cabbage-trees were not thicker than a man's leg, and from 10 to 20 feet high. The cabbage, each tree producing but one, is at the top, enclosed in the stem. This vegetable is not only wholesome, but exceedingly palatable; and some excellent fish we caught made a luxurious entertainment.

On Tuesday the 11th, we sailed from Norfolk Island, which we weathered, having stretched to S. S. W. We found the coast bounded with rocky cliffs and banks of coral sand. On the south side lie two isles, which serve as roosting and breeding places, for white boobies, gulls, tern, &c. A bank of coral sand and shells, surrounds the isle, and extends, especially southward, seven leagues off. Our intention at this time was to refresh the crew, and repair the ship, in Queen Charlotte's Sound.

On Monday the 17th, we had in view mount Egmont, perpetually covered with snow, bearing S. E. half E. distant about eight leagues. The wind now blew a fresh gale, with which we steered S. S. E. for Queen Charlotte's Sound. The wind at last increased in such a manner, that we could carry no more sail than the two courses, and two close-reefed topails: under these we steered for Cape Stevens, which we made at 11 o'clock at night.

On the 18th, we made a trip to the north, and bore away for the sound. We hauled round Point Jackson, at nine A. M. and at 11 o'clock anchored before Ship Cove, the wind and tide not permitting us to get in. Capt. Cook, in the afternoon went ashore, and looked for the bottle, with the memorandum, which he left when last here, but it was taken away by some person or other. The seine was hauled twice and only four fish caught: but several birds were shot, and the nests of some shags were robbed of their young ones.

On the 19th, the ship was warped into the cove, and moored. The sails were unbent, several of them having been much damaged in the late gale. The main and fore courses were condemned, and the topmasts were struck and unrigged. The forge was set up, and tents erected on shore for the reception of a guard, &c. Plenty of vegetables were gathered for the refreshment of the crew, which were boiled every morning with oatmeal and portable broth for breakfast. From some circumstances, as cutting down trees with saws and axes, and a place found where an observatory had been set up in our absence, we had no doubt but the Adventure had been in this cove since we left it.

On the 20th our men began to caulk the ship's sides, and on Saturday the 22d, the captain accompanied by the botanists went to visit our gardens in Motuara, which we found had been wholly neglected by those of the natives to whom we had given them in charge; nor had any care or cultivation been bestowed on them. Nevertheless, the soil seemed to agree well with the plants, for many of them were in a flourishing condition. Not having hitherto seen any of the natives, we made a fire on the land, hoping this would induce them to come down to us.

On the 24th, we saw two canoes coming down the sound, which, when the ship was seen by the people, retired behind a point on the west-side. After breakfast we went in search of them, and having fired at several birds, the report of our pieces gave notice of our being near, and they discovered themselves by hallooing to us in Shag Cove; but when we landed, and drew near to their habitations, they all fled, except two or three men, who maintained their ground, with their weapons in their hands. The moment we landed they knew us, and their fears subsided. Those who had fled returned from the woods, embraced us over and over again, and expressed their joy at seeing us, by jumping and dancing in a frantic manner; but the men would not suffer some women we saw at a distance to come near us. We made them presents of hatchets and knives, and in return they gave us a quantity of fish they had just caught. The next morning they brought us more fish, which they bartered for Otaheitean cloth. We asked them on what account they were afraid of us, and also what was become of our old friends? To these questions we got no satisfactory answers; but they talked much about killing, which was variously understood by us.

On Wednesday the 26th, some of the natives went to the tents, and told our people, that a ship like ours had lately been lost, that some of the men landed at Vanna Aroa, near Terrawhitte, on the other side the strait; that a dispute happened between them and the natives; that several of the latter were shot; and that the natives got the better of them when they could fire no longer, and both killed and ate them. One of the relaters of this strange tale, said it was 20 or 30 days ago; but another said it was two moons since, and described, as well as he could, in what manner the ship was beat to pieces. The following day they told the same story to others, which made the captain, and indeed all of us, very uneasy about the Adventure, but when the captain enquired himself, and endeavoured to come at the truth of these reports, the very people who raised them, denied every syllable of what they had said, and seemed wholly ignorant of the matter; so that we began to think the whole relation had reference only to their own people and boats. On the 28th, we again went on shore, but found no appearance of the hogs and fowls we had left behind. Having been a shooting to the west bay, in our return we got some fish from the natives

natives for a few trifling presents. As we came back, some of the party thought they heard a pig squeak in the woods. We shot this day a good many wild fowl and small birds. On the 31st, it was somewhat remarkable that all the natives left us.

Tuesday, the 1st of November, we were visited by a number of strangers, who came from up the sound. The principal article of trade they brought with them was green stone, some of which were the largest pieces we had ever seen. On the 3d, a large black sow was seen by the botanizing party, which we discovered to be the same that Capt. Furneaux left behind him. Supposing it to be a boar we carried over to Long Island a sow, but seeing our mistake, we brought her back. This incident afforded us some hopes, that this island in time will be stocked with such useful animals. Lieutenant Pickersgill was told the same story by one of the natives, of a ship having been lost, but the man declared, though many people were killed, it was not by them. On the 5th, we obtained a reasonable and plentiful supply of fish from our old friends. Early in the morning Capt. Cook, accompanied by Mr. Sparrman, and the Messrs. Forsters, embarked in the pinnace, and proceeded up the sound, in order to discover a passage that way out to sea by the S. E. We were met by some fishermen, who all declared, there was no passage by the head of the sound; and soon after four men in a canoe concurred in the same opinion, confirming what the others had said, but they gave us to understand, that there was such a passage to the east. We therefore laid aside our first design of going to the head of the sound, and proceeded to this arm of the sea, on the S. E. side, which is about five leagues above the Isle of Mortuara. Within the entrance, at a place called Korieghenooc, we came to a large settlement of the natives. Their chief, Tringo-bohee, and some of his attendants had lately been on board the ship, by whom we were received with great civility; and these people encouraged us to pursue the object we had in view. We therefore continued our course down this arm of the sea, E. N. E. and E. by N. having a view of several fine coves, which we passed, and at length we found it open, by a channel about a mile wide, into the strait. A strong tide ran out, and we had observed another setting down the arm. Near four o'clock P. M. this tide ceased, and was succeeded by the flood. The outlet lies S. E. by E. and N. W. by W. from Terrawhitte. A little within the entrance, we found thirteen fathoms water; but, from its situation, it seemed necessary to have a trading wind either to go in or out of this channel; but having determined to return on board before night, we had not time to make other necessary observations. We saw a Hippah, or strong hold, about two miles within the entrance, built on the north side, which we omitted visiting, though the inhabitants made signs for us to come on shore; but, without paying any regard to them, we made the best of our way for the ship, and returned on board about ten o'clock, bringing with us a few fish and birds; among which last were some ducks we had shot, of the same kind as those in Dusky Bay. The natives knew these, and several other sorts, by the drawings, and had a particular name for each.

On Sunday, the 6th, our old friends returned, and

took up their abode near the tents. An old man, named Pedero, made Capt. Cook a present of a staff of honour, such as the chiefs carry; and, in return, the captain dressed him up in a suit of old cloaths, which made him very happy. He had a fine person, and his colour only distinguished him from an European. We enquired of him and his companion, if the Adventure had been there during our absence; and they gave us to understand, that she arrived a little time after our departure; that she staid about twenty days, and had been gone ten moons; and that neither she, nor any other ship, had been stranded on the coast. This account made us easy respecting the Adventure, but did not wholly remove our suspicions of some misfortune having happened to strangers. This day we went with a number of hands, in order to catch the sow and put her to boar, but we returned without seeing her. Pedero dined with us, partook heartily of every thing set before him, and drank more wine than any one at table, without being in the least intoxicated. On the 8th, we put a boar, a sow, and two pigs on shore, near Cannibal Cove; so that we hope all our repeated endeavours to stock this country will not prove fruitless. We found a hen's egg a few days ago, and therefore believe, that some of the cocks and hens we left here are still in being. On the 9th, we unmoored, and shifted our station farther out the cove, for the more ready getting to sea; but at present, the caulkers had not finished the sides of the ship; and we could not sail till this work was completed. Our friends brought us a large supply of fish, and, in return, we gave Pedero a large empty oil jar, with which he seemed highly delighted. We never saw any of our presents after they received them, and cannot say whether they gave them away, or what they did with them; but we observed, every time we visited them, they were as much in want of hatchets, nails, &c. as if we had not bestowed any upon them. Notwithstanding these people are cannibals, they are of a good disposition, and have not a little humanity. We have before observed the inconveniencies attending them for a want of union among themselves; and we are persuaded, though upon the whole very numerous, they are under no form of government. The head of each tribe, or family, is respected; respect may command obedience; but we are inclined to think, not one among them has either a right or power to enforce it. Very few, we observed, paid any regard to the words or actions of Tringo-bohee, though he was represented to us as a chief of some note. In the afternoon we went into one of the coves; where, upon landing, we found two families employed in different manners: some were making mats, others were sleeping; some were roasting fish and roots; and one girl was employed in heating stones, which she took out of the fire as soon as they were hot, and gave them to an old woman, who sat in the hut. The old woman placed them one upon another, laid over them some green cellery, and over all a coarse mat: she then squatted herself down on the top of the heap, and sat very close. Probably this operation might be intended as a cure for some disorder, to be effected by the steams arising from the green cellery, and we perceived the woman seemed very sickly.

Observations—Remarks on islands, and the animals found in them, near Staten Land—Departure from Staten island—Nau-
tical observations—The island of Georgia discovered, and a descriptive account of the same.*

THURSDAY, Nov. 10, at day-break, we weighed
and sailed from Queen Charlotte's Sound, in
New Zealand, having a fine breeze at W. N. W. All
No. 21.

our sails being set, we got round the Two Brothers, and
stretched for Cape Campbell, at the S. W. entrance of
the strait. We passed this at four o'clock P. M. distant
five

five leagues, and then steered S. S. E. half E. On the 11th, at seven o'clock P. M. Cape Palliser bore N. half W. distant sixteen leagues, from which Cape, for the third time, we took our departure. We now steered S. by E. in order to get into the latitude of 54 or 55 deg. Capt. Cook's intention being to cross this vast ocean in these parallels, hoping by this course to pass over those parts, which, the preceding summer, were left unexplored. On the 12th, A. M. we were in latitude 43 deg. 13 min. 30 sec. S. and in 176 deg. 41 min. E. longitude, when we saw an uncommon fish of the whale kind; and, in the afternoon, the Pintado Peterels began to appear. On the 13th, at seven in the evening, we hauled up towards a fog bank, which we took for land; after which we steered S. E. by S. and saw a seal. At noon, by observation, we found our latitude to be 44 deg. 25 min. S. longitude 177 deg. 31 min. E. On the 14th, we saw another seal in latitude 45 deg. 54 min. and 179 deg. 29 min. E. long. On the 15th, having passed the great meridian of 180 deg. E. which divides the globe into two equal parts, we began to reckon our longitude west of Greenwich. At noon our latitude observed was 49 deg. 33 min. longitude 175 deg. 31 min. W. On Thursday the 17th, we saw a seal, some penguins, and pieces of sea weed. On the 19th we were in latitude 53 deg. 43 min. and on the 20th, at noon, in latitude 54 deg. 8 min. longitude 162 deg. 18 min. W. Monday, the 21st, we steered S. E. by S. and at noon we saw abundance of blue peterels, in latitude 55 deg. 31 min. longitude 160 deg. 29 min. On the 22d, at noon our latitude by observation was 55 deg. 48 min. longitude 156 deg. 56 min. W. In the afternoon, having a light breeze at S. S. E. we steered east, northerly; and, in the night, was a faint appearance of the Aurora Australis. On the 23d, we were in latitude 55 deg. 46 min. S. longitude 156 deg. 13 min. W. when a fresh gale blew from the west, and we steered now E. half N. On the 26th, we were in latitude 55 deg. 8 min. S. and in 148 deg. 10 min. W. longitude.

On Sunday, the 27th, we steered east, having a steady fresh gale; and at noon, were in latitude 55 deg. 6 min. S. and in 138 deg. 56 min. W. longitude. In this parallel, not a hope remained of finding any more land in the southern Pacific Ocean. We resolved therefore to steer for the west entrance of the Straights of Maghellan, with a view of coasting the south side of Terra del Fuego, round Cape Horn, to the Strait Le Maire. We thought this track might be an advantage to navigation and geography, as the world is little acquainted with that shore. In the afternoon we had squally weather, which carried away our top-gallant mast. On the 28th A. M. the bolt rope of the main top-sail broke, whereby the sail was split. The ropes, to our square sails especially, are not of a size and strength sufficient to wear out the canvases. At noon we were in latitude 55 deg. 20 deg. S. and in 134 deg. 16 min. W. longitude. On the 29th, the wind abated; and on the 30th, at 8 o'clock P. M. the wind veering to N. E. we tacked, and stood to E. S. E. We were now in latitude 55 deg. 22 min. S. and in 128 deg. 45 min. W. longitude. Several albatrosses and peterels were seen.

On Thursday, the 1st of December, at 3 o'clock P. M. it fell a calm, but at about seven, we got a wind at S. E. with which we stood N. E. On the 5th, a fine gale at south, enabled us to steer east, with very little deviation to the north; and the wind now altering to S. W. and blowing a steady gale, we continued to steer east, inclining a little to south. At six o'clock in the evening, we were in latitude 53 deg. 8 min. and in 115 deg. 58 min. W. longitude. On the 6th, we had some snow showers; and on Wednesday, the 7th, a fine pleasant gale, with showers of rain. On the 9th, at noon, we found ourselves by observation, in latitude 53 deg. 37 min. and in 103 deg. 44 min. west longitude. The wind veered now to N. E. and afterwards came insensibly round to the south by the E. and S. E. On the 10th we passed a small bed of sea weed, in latitude 54 deg. longitude 102 deg. 7 min. W. On the 11th, we

steered E. half a point N. and on the 12th, at six in the evening, we were in latitude 53 deg. 35 min. longitude 95 deg. 52 min. W. Many and various sorts of albatrosses were hovering about the ship. On Monday, the 12th, we had a calm which continued till midnight, when a breeze from the south fixing at west, we steered east. On the 14th, in the morning, we found the variation of the compass to be 13 deg. 25 min. E. in latitude 53 deg. 25 min. longitude 87 deg. 53 min. W. which increased in such a manner, that on the 15th, in the latitude of 53 deg. 30 min. longitude 82 deg. 23 min. W. it was 170 E. This day we saw a penguin; and on the 16th, a seal, and some diving peterels. On Saturday the 17th, the variation increased to 21 deg. 38 min. being in latitude 53 deg. 16 min. S. and in 75 deg. 9 min. west longitude. All this day we steered east by north, and east half north, under all the sails we could carry, in hopes of seeing the land before night; but not making it till ten o'clock, we steered east, in order to make sure of falling in with Cape Defeada. At midnight we made the land, extending from N. E. by N. to E. by S. about six leagues distant; upon seeing which we brought to with the ship's head to the south. Having sounded, we found seventy-five fathoms water, the bottom good. The land before us we concluded to be the west coast of Terra del Fuego, near the west entrance of the Straights of Maghellan. This being the first run made by Capt. Cook in a high southern latitude, we have been very particular in noting all the material circumstances we could collect together. In this course the weather had been neither unusually stormy, nor cold. Before we arrived in the latitude of 50 deg. the mercury in the thermometer fell gradually from sixty to fifty; and in the latitude of 55 deg. it was generally between forty-seven and forty-five; once or twice it fell to forty-three. These observations were made at noon. We had now entirely left the southern Pacific Ocean, and we trust the world will give our captain some credit for having well explored the same; nor could, in our opinion, more have been done towards obtaining that end, in one voyage, than has been effected in this. We must not omit to observe, that soon after we left New Zealand, Mr. Wales contrived, and fixed up an instrument, which measured with great accuracy, the angle the ship rolled in, when sailing large, and in a great sea; and that in which she lay down, or heeled, when sailing upon a wind. The greatest angle he observed the Resolution to roll, the sea at the time not being unusually high, was 38 deg.

On Sunday, the 18th, we made sail, and steered S. E. by E. along the coast. Near a league from the main is a high ragged isle, which we called Landfall. At four o'clock A. M. we were N. and S. of the high land of Cape Defeada, distant nine leagues; but saw none of the low rocks said to lie off it. This cape lies in latitude 53 deg. S. and in 74 deg. 40 min. W. longitude. We continued to range the coast, and at eleven o'clock, we passed a projecting point, having a round surface, and of considerable height, to which we gave the name of Cape Gloucester. It has the appearance of an island; and is situated S. S. E. half E. seventeen leagues from the isle of Landfall. Between these the coast forms two bays, strewed with rocky islets, rocks, and breakers. The coast appeared unconnected, as if formed of a number of islands. The land is very mountainous, rocky, and barren, but in some places, covered with tufts of wood, and patches of snow. From Cape Gloucester, the direction of the coast is nearly S. E. but to Cape Noir, for which we steered, the course is S. S. E. At noon Cape Gloucester bore north, distant eight miles, and the most advanced point of land bore S. E. by S. distant seven leagues. At three o'clock we passed Cape Noir, situated in latitude 54 deg. 30 min. S. and in 73 deg. 33 min. W. longitude. When at a distance, the land of the cape appeared to be an island disjoined, but upon a nearer approach we found it connected by a low neck of land. Two rocks lie at the point of the Cape, the one pointed like a sugar-loaf, the other not so high, with a rounder surface;

face; and two leagues from the Cape are two rocky islets, S. by E. After passing these last, we crossed the great bay of St. Barbara, steering E. S. E. The land at the bottom of it, which we just perceived, could not be less than seven leagues off. We observed a space, in the direction of E. N. E. from Cape Noir, where not any land was to be seen: this may be the channel of St. Barbara, which opens into the Straights of Maghellan, as mentioned by Frazier; with whose description we found the Cape to agree very well.

On the 19th, at two o'clock A. M. we passed the S. E. point of the bay of St. Barbara, which the Captain called Cape Desolation, on account of the country near it, being the most desolate and barren that ever was seen. It lies in latitude 54 deg. 55 min. S. and in 72 deg. 12 min. W. longitude. To the east of the Cape about four leagues, and at the mouth of a deep inlet, is a pretty large island, and some others less considerable. In latitude 55 deg. 20 min. S. we were three leagues from an island, which Capt. Cook named Gilbert Isle, after his master. Its surface is composed of several unequal peaked rocks, nearly of the same height with the rest of the coast. S. E. of this isle are breakers, and some smaller islands. Scarcely any prospect can appear with a more barren and savage aspect, than the whole of this country; which is composed of rocky mountains, without a single trace of vegetation to enliven or vary the scene. The mountains of the coast terminate in horrible precipices, whose craggy summits tower to a vast height; and those that are inland are covered with snow; but the former are not. The first we judged to belong to the main of Terra del Fuego, and the last to be islands, which to appearance formed a coast. Having made a short trip to the south, we stood in for land, the nearest point of which in sight, bore east ten leagues. It is a lofty promontory, E. S. E. from Gilbert Isle, in latitude 55 deg. 26 min. S. and in 70 deg. 25 min. W. longitude. From our present point of view, it terminated in two high towers, and within them, a hill shaped like a sugar loaf. To this rock we gave the name of York Minister. To the westward of this head land, about two leagues, we discovered a large inlet, the west point of which we fetched in with; and tacked in 41 fathoms water, not more than half a league from the shore. To the westward of this inlet we saw another, with several islands at its entrance.

On Tuesday the 20th, we perceived the ship to drive off the shore out to sea; which we attributed to a current; for by the melting of the snow, the inland waters will occasion a stream to run out of most of these inlets. In the evening, a breeze springing up at E. by S. we stood in for the land, being desirous of entering one of the many ports, in order to take a view of the country, and to recruit our stock of wood and water. In standing in for an opening, apparently on the east side of York Minister, we founded in 40 and 60 fathoms water. Our last soundings were nearly between the two points that form the entrance to the inlet, which we observed to branch out into two arms. We stood for that to the east, as being clear of islets; but upon founding, found no bottom with a line of an 120 fathoms. In this disagreeable situation a breeze springing up, our captain resolved to stand up the inlet; but night approaching, our safety depended on casting anchor, we therefore continued founding, but always, to our mortification, in an unfathomable depth. We now hauled up under the east-side of the land, and seeing a small cove, sent the boat a-head to found, while we kept with the ship as near the shore as possible. The boat soon returned with the information we wished for, and we thought ourselves happy, when we had anchored in 30 fathoms, in a bottom of sand and broken shells.

On the 21st, a party was sent out with two boats, to look for a more secure station. They found a cove above the point under which the ship lay, in which was exceeding good anchorage. At the head of it was a stoney beach, a valley covered with wood, and a stream of fresh water; conveniences more favourable than we could expect would be found in such a place. Here

also they shot three geese out of four. Orders were now dispatched by Lieut. Clerke to remove the ship into this place, and we proceeded with Capt. Cook in the other boat, farther up the inlet. We now discovered, that the land we were under, which disjoined the two arms, as mentioned before, was an island, at the north end of which the two channels united. We returned on board, and found every thing in readiness to weigh; which was done, and all the boats sent out to tow the ship round the point; but a light breeze springing up, we were obliged to drop the anchor again, lest the ship should fall upon the point. However, we soon after got round this under our stay-fails, and anchored in 20 fathoms water. We were now shut in from the sea by the point above-mentioned, which was in one with the extremity of the inlet to the east. Our distance from shore was not more than a third of a mile; and islets off the next point above us, covered the ship from the N. W. from which quarter the wind had the greatest force. All hands were immediately employed: some to clear a place to fill water; some to cut wood, and others to pitch a tent, for the reception of a guard, and Mr. Wales could find no better station for his observatory than the top of a rock, not exceeding nine feet over.

On Thursday the 22d, two parties were sent out, one to examine and draw a sketch of the channel, on the other side of the island, and the Captain, attended by the botanists, to survey the northern side of the found. In our way to this latter place, we landed on the point of a low isle covered with herbage, several spots of which had been lately burnt; these, with a hut we discovered, were signs that people were in the neighbourhood. From hence we proceeded round the east end of Burnt Island, over to what we supposed to be the main land of Terra del Fuego, where we discovered a fine harbour, surrounded by high rocks, down which glided many purling streams, and at their feet were some tufts of trees, very fit for fuel. Capt. Cook named this harbour the Devil's Bason. It is divided into two parts, an inner and an outer one; and the communication between them is by a narrow channel five fathoms deep. We found at one time 17 in the outer bason, and 23 in the inner one. This last is shaded from the sun in his meridian splendor, and, though very secure, is intolerably gloomy. The outer harbour has not so much of this inconvenience, is equally safe, and rather more commodious. It lies about a mile distant from the east end of Burnt Island, in the direction north. We discovered other harbours to the west of this, and found wood for fuel, and fresh water, in or near them all. Before one was a stream of fresh water, which came out of a large lake, continually supplied by a falling cascade. The whole country is a barren rock, except the fire wood which grows here, and what we saw of it affords no other vegetation of any kind. But to compensate for this dreary scene of sterility, about the sea coast, the all-bountiful God of nature has scattered many large and small, but fruitful low islands, the soil of which is a black rotten turf, composed of decayed vegetables. On one of these we saw several huts that had lately been inhabited. Near them was a good deal of celery; we put as much as we could conveniently stow in our boat, and at seven o'clock in the evening we returned on board. During our absence a fatal accident had befallen one of our marines, who had not been seen since 11 o'clock the preceding night. We supposed he had fallen overboard, and was drowned. In this excursion we shot only one duck, three shags, and about the same number of rails or sea-pies. The other party, among whom were Lieutenants Clerke and Pickersgill, returned on board some hours before us. On the west-side of the other channel, they discovered a large harbour and one smaller, of both which they took sketches.

On the 23d, Lieut. Pickersgill went out to examine the east side of the found, while the Captain proceeded in the pinnace to the west-side, with a view of going round the island under which the ship lay, which he called Shag Island; and in order to take a survey of the

the passage leading to the harbours our two lieutenants had discovered the day before. If coming from sea, it is necessary to leave all the rocks and islands, lying off and within York Minster, on the larboard-side, and the black rock, off the south-end of Shag Island, on the starboard. When abreast of the south-end of that island, we hauled over for the west shore, taking care to avoid the beds of weeds, indications of rocks, some of which were 12 fathoms under water; but we thought it the safest way always to keep clear of them. The entrance into the large harbour, which we called Port Clerk, is to the north of some low rocks, lying off a point on Shag Island. This harbour lies in W. by S. a mile and a half. It hath wood and fresh water, and from 12 to 24 fathoms deep. To the southward of Port Clerk, seemed to be another harbour, formed by a large island; without this, between it and York Minster, the whole sea appeared strewed with islets, rocks, and breakers. At the south end of Shag Island the shags breed in vast numbers, in the cliffs of the rocks. We shot some of the old ones, but could not come at the young ones, which are by much the best eating. We likewise brought down three wild geese, a valuable acquisition at this time. We returned and got on board at seven o'clock in the evening. Mr. Pickersgill, who had just before arrived, informed us, that the land opposite to our station is an island; that on another, more to the north, he found many terns eggs; and in a cove between that and the East Head, he had shot one goose, and got some young gossings.

On Saturday the 24th, two sporting parties went over one of the N. E. side of the island above mentioned, which was named Goose Island; and the other, accompanied by Capt. Cook, went by the S. W. side. When under the island we had plenty of sport, having shot as many geese as served for a Christmas meal for our men, which proved much more agreeable to them than salt beef and pork. We all returned heartily tired, by climbing over the rocks, when we had landed, in pursuit of our game. In the south of the island were abundance of geese, it being their moulting season, when most of them come on shore, and are not disposed to fly. Our party got sixty-two, and Mr. Pickersgill, with his associates fourteen. Plenty of shags were seen in the cove, but we proceeded without spending time or shot upon them. We were informed by our people on board, that a number of natives, in nine canoes, had been along-side, and some of them in the ship: they seemed well acquainted with Europeans, and had several of their knives among them.

On the 25th, being Christmas-day, we had another visit from them. They appeared to be of the same nation, we had formerly seen in Success Bay; and which M. de Bougainville calls Pecharas, because they continually used this word. They are diminutive, ugly, half-starved, beardless race; almost naked, being only slightly covered with a seal-skin or two joined together, so as to make a cloak, which reached to their knees; but the greatest part of them had but one skin, which scarcely covered their shoulders, and all their lower parts were quite naked. The women are clothed no better than the men, except that they cover their nakedness with a seal-skin flap. They are inured from their infancy to cold and hardships, for we saw two young children at the breast entirely naked. They remained all the time in their canoes, having their bows and arrows with them, and harpoons, made of bone, with which we imagined, they strike and kill fish. Both they and their cloaths smelt most intolerably of train oil. We threw them some biscuit, but they seemed much better pleased with our presents of medals, knives, &c. Their canoes were made of bark, and on each of them was a fire. They had also large seal hides, which may serve as covering to their huts, on shore, in foul weather. They all departed before dinner, nor did we believe, any one invited them to partake of our Christmas cheer, which consisted of geese, roast and boiled, goose-pye, &c. a treat little known to us; and which was heightened by Madeira wine, the only article of our provisions that was mended by keeping. Per-

haps our friends in England did not celebrate Christmas more cheerfully than we did; and, with such fare it would have been a real disappointment, to have had our appetites spoiled, by the dirty persons of those filthy people, and by the stench they always carried about them. We called this place Christmas Sound, in honour of the day, and the joyful festival we had celebrated here. On the 26th, we were again visited by some of the natives, and as it was very cold in the evening, and they stood shivering on the deck, the Captain from an impulse of humanity, gave them some old canvas and baize for covering.

On Tuesday the 27th, every thing on shore was ordered on board. The weather being fine and pleasant, a party of us went round by the south side of Goose Island, and picked up 31 of these kind of birds. On the east-side of the island, to the north of the east point, is a good place for ships to lay in that are bound for the west. When we returned on board, we found all the work done, and the launch in, so that we now only waited for a fair wind to put to sea. The entrance of Christmas Sound, which we expected soon to leave, is three leagues wide, and situated in latitude 55 deg. 27 min. S. and in 70 deg. 16 min. W. longitude; in the direction of north 37 deg. W. from St. Ildefonso Isles, distant 10 leagues. We think these isles to be the best land mark for finding the sound. It is advisable for no one to anchor very near the shore, for we generally found there a rocky bottom. The refreshments to be procured at this place are wild fowl, very good celery, and plenty of muscles, not large, but well tasted. The geese are smaller than our English tame ones, but eat as well as the best of them. The gander is all white; the female spotted with black and white, with a large white spot on each wing. Here is also a kind of duck, which our people called the race-horse, on account of its swiftness on the water, for the wings being too short to support the body in the air, it cannot fly. We believe, from certain circumstances, the people do not live here throughout the whole of the winter-season, but retire to parts where the weather is less severe. To appearance, they are the most wretched of all the natives we have seen. They live in an inhospitable clime, and do not seem to have sagacity enough to provide themselves with the comforts of life, particularly in the article of cloathing. Barren as this country is, our botanists found therein many unknown plants. In the woods is the tree which produceth the winter's bark; also the holly-leaved barberry; and plenty of berries, which we called cranberry; with many other sorts common in these straits.

On Wednesday the 28th, we sailed from this sound, with a light breeze at N. W. At noon Point Nativity, being the east part of the sound, bore N. half W. distant one league and a half. We steered S. E. by E. and E. S. E. till four o'clock, P. M. when we hauled to the south, for the sake of a nearer view of St. Ildefonso. The coast appeared indented as usual, and at this time we were abreast of an inlet lying E. S. E. At the west point of this are two high peaked hills, and below them, to the east, two round ones, or small isles, in the direction of N. E. and S. W. from each other. At half past five o'clock, we had a good sight of Ildefonso Isles. These are situated about six leagues from the main, in latitude 55 deg. 53 min. S. and in 69 deg. 41 min. W. longitude. We now resumed and continued our course to the east. At sun-set the nearest land bore S. E. by E. three fourths E. and the west point of Nassau Bay, discovered by Admiral Hermite in 1624, bore north 80 deg. E. six leagues distant. This point, in some charts, is called False Cape Horn, as being the southern point of Terra del Fuego. It lies in latitude 55 deg. 39 min. S. From the above mentioned inlet to this false cape, the direction of the coast is nearly E. half a point S. distant 14 or 15 leagues.

On the 29th, at three o'clock A. M. we steered S. E. by S. at four Cape Horn, for which we now made sail, bore E. by S. at a distance it is known by a round high hill over it; and though to the W. N. W. there is a point not unlike this, yet their situations will always be

A View in CHRISTMAS SOUND. TIERRA DEL FUEGO.

A PLAN OF SUCCESS BAY IN STRAIT LE MAIRE.

A CHART of the S.E. part of TERRA DEL FUEGO, including STRAIT LE MAIRE and part of STATEN LAND by CLIFF COOK 1769.

be sufficient to distinguish the one from the other. At half past seven we passed this cape, and entered the Southern Atlantic Ocean. Two peaked rocks are on the N. W. side of the cape, resembling sugar loaves; also other low straggling rocks to the west, and one south of it. From Christmas Sound to this Cape, the course is E. S. E. one fourth E. distant 31 leagues. The rocky point three leagues from Cape Horn, in the direction E. N. E. we called Mistaken Cape. It is the southern point of the easternmost of Hermite Isles. There seemed to be a passage between these two capes into Nassau Bay. In this passage some isles were seen, and on the west side, the coast had the appearance of forming good bays and harbours. In some charts Cape Horn is laid down as part of a small island, which we had not in our power to confirm or contradict, as the hazy weather rendered every object indistinct. From hence we steered E. by N. half N. without the rocks that lie off Mistaken Cape. Having passed these, we steered N. E. half E. and N. E. for Strait le Maire. At eight o'clock in the evening, finding ourselves near the strait, we shortened sail, and hauled the wind. The sugar-loaf on Terra del Fuego bore north 33 deg. W. the point of Success Bay just open of the cape of the same name, bearing north 20 deg. E.

On the 30th, during the calm, we were driven by the current over to Staten Land; but a light breeze springing up at N. N. W. we stood over for Success Bay. We hoisted our colours, and, having before fired two guns, we perceived a smoke rise out of the woods, made by the natives above the fourth point of the bay, which was the place where they resided when we were here in 1769. A party was now sent into Success Bay, in order to discover if any traces of the Adventure were to be seen there; but they returned without having found any. Our ship's name, &c. were written on a card, and nailed to a tree which stood near the place where it was likely the Adventure would water, should she be behind us, and put into this place. When Mr. Pickersgill landed, the natives received him and his associates with great courtesy. They were clothed in seal skins, had bracelets on their arms, and appeared to be the same kind of people we had seen in Christmas Sound. The bracelets were made of silver wire, wrought somewhat like the hilt of a sword, and no doubt, the workmanship of an European. According to Mr. Pickersgill's report, the bay was full of whales and seals, and we had observed the same in the strait, particularly on the Terrel del Fuego side, where the whales are exceeding numerous. Having now explored the south coast of Terra del Fuego, we resolved to do the same by Staten Land. At nine o'clock the wind veering to N. W. we tacked, and stood to S. W.

On Saturday the 31st in the morning, we bore up for the east end of Staten Land; which, at half past four bore south 60 deg. E. the west end fourth 2 deg. E. and Terra del Fuego fourth 40 deg. W. The weather being hazy, we could only now and then get sight of the coast; but as we advanced to the east, several islands were seen of unequal extent. We were abreast of the most eastern one at eight o'clock, A. M. when we waited some time for clear weather: but as it did not clear up as we wished, we hauled round the east end of the island, for the sake of anchorage, if we should think it necessary. We were now distant from the isle two miles, and sounding found only 29 fathoms water. As we continued our course, we saw on this island a great number of seals and birds, a strong temptation to our people who were in want of fresh provisions; and in hauling round it, we had a strong race of a current, like unbroken water. At length, after fishing for the best ground, we cast anchor in 21 fathoms water, about a mile from the island, which extended from north 18 deg. E. to N. 55 deg. and half W. The weather having soon after cleared up, we had a sight of Cape St. John, or the east end of Staten Land, bearing south 75 deg. E. distant four leagues. The island sheltered us from the north wind, and Staten Land from the south. The other isles lay to the west, and secured us from the north wind; yet we were not only open to

the N. E. and E. but to the N. W. winds. We might have avoided this situation, by anchoring more to the west, but the Captain was desirous of being near the island, and of having it in his power to get to sea with any wind. In the afternoon a large party of us landed, some to kill seals, and others birds or fish. The island was so stocked with the former, which made such a continual bleating, that we might have thought ourselves in Essex, or any other country where cows and calves are in abundance. Upon examination we found these animals different from seals, though they resembled them in shape and motion. The male having a great likeness to a lion, we called them on that account lions. We also found of the same kind as the New Zealand seals, and these we named sea-bears. We shot some of the large ones, not thinking it safe to go near them; though, in general, they were so tame, that we knocked some down with our sticks. Here were a few geese and ducks, and abundance of penguins and shags; the latter of which had young ones almost fledged, consequently just to our taste. In the evening our party returned sufficiently laden with provisions of various sorts.

On the 1st of January, being Sunday, Mr. Gilbert was sent out to Staten Land, in search of A. D. 1775. a good harbour, nothing more being wanting, in the opinion of Captain Cook, to make this place a good port for ships to touch at for refreshments. Another party went to bring on board the beasts we had killed the preceding day. The old lions and bears were good for nothing but their blubber, of which we made oil; but the flesh of the young ones we liked very well: even the flesh of the old lionesses was not much amiss; but that of the old males was abominable. Captain Cook took an observation of the sun's meridian altitude (his height at noon) at the N. E. end of this island, which determined its latitude at 54 deg. 40 min. 5 sec. S. Having shot a few geese, some other birds, and supplied ourselves plentifully with young shags, we returned on board in the evening. About ten o'clock the party returned from Staten Land, where they found a good port, in the direction of north, a little easterly, from the N. E. end of the Eastern Island, and distant three leagues to the westward of Cape St. John. The marks whereby it may be known, are some small islands lying in the entrance. The channel, which is on the east side of these islands, is half a mile broad. The course is in S. W. by S. turning gradually to W. by S. and W. The harbour is almost two miles long, and near one broad. The bottom is a mixture of mud and sand, and hath in it from 10 to 50 fathoms water. Here are several streams of fresh water, with good wood for fuel. On this island are an innumerable number of sea-gulls, the air was quite darkened with them, upon being disturbed by our people: and when they rose up, we were almost suffocated with their dung, which they seemed to emit by way of defence; and it stunk worse than what is vulgarly called Devil's-dung. This port was named New-Year's Harbour, from the day on which it was discovered, and is certainly a very convenient one for shipping, bound to the west, or round Cape Horn. It is true, ships cannot put to sea with an easterly or northerly wind; but these winds are never known to be of long continuance, and those from the south or west quarters are the most prevailing.

On Tuesday the 3d, we weighed and stood for Cape St. John, which, in the evening, bore N. by E. distant four miles. This cape, being the eastern point of Staten Land, is a rock of considerable height, situated in latitude 54 deg. 46 min. S. and in 64 deg. 7 min. W. longitude, having a rocky islet lying close under the north point of it. To the westward of the cape is an inlet, which seemed to communicate with the sea to the south; and between this and the cape is a bay. Having doubled the cape, we hauled up along the south coast. At noon Cape St. John bore north 20 deg. E. distant about three leagues: Cape St. Bartholomew, or the S. W. point of Staten Land, south 83 deg. W. two high detached rocks north 80 deg. W. By observation

our latitude was found to be 54 deg. 56 min. S. We now judged this land to have been sufficiently explored; but before we leave it, think it necessary to make a few observations on this and its neighbouring islands.

The S. W. coast of Terra del Fuego, with respect to inlets and islands, may be compared to the coast of Norway; for we believe within the extent of three leagues there is an inlet or harbour, which will receive and shelter the first rate ships; but, till these are better known every navigator must, as it were, fish for anchorage: add to this, there are several rocks on the coast; though as none lie far from land, the approach to them may be known by sounding, if they cannot be seen; so that upon the whole, we cannot think this the dangerous coast it has been represented by other voyagers. Staten land is thirty miles in length, and nearly twelve broad. Its surface consists of craggy hills, towering up to a vast height, especially near the west end, and the coast is rocky. The greatest part of the hills, their summits excepted, is covered with trees, shrubs, and herbage. We cannot say any thing, that navigators may depend on, concerning the tides and currents on these coasts; but we observed that in Strait Le Maire, the southerly tide, or current, begins to set at the new and full moon about four o'clock. It may also be of use to our commanders to remark, that if bound round Cape Horn to the west, and not in want of any thing that might make it necessary to put into port, in this case, we would advise them not to come near the land; as by keeping out to sea, they would avoid the currents, which, we are convinced, lose their force at twelve leagues from land; and at a greater distance they would find none to impede their course. We would just add to these nautical observations, that all the time of our being upon the coast, we had more calms than storms; the winds were variable; nor did we experience any severe cold weather. The mercury in the thermometer, at noon, was never below 46 deg. and during our stay in Christmas Sound, it was generally above temperate.

The island we landed on, and the same may be said of the neighbouring isles, is very unlike Staten Land. Its surface is of equal height, having an elevation of thirty or forty feet above the sea, from which it is secured by a rocky coast. It is covered with sword grass, of a beautiful verdure, and of great length, growing in tufts, on little hillocks. Among these are the tracks of sea bears and penguins, by which they retire into the centre of the isle. These paths rendered our excursions rather disagreeable, for we were sometimes up to our knees in mire. Indeed the whole surface is moist and wet. The animals on this little spot are sea lions, sea bears, a variety of sea fowls, and some land birds. The largest lion we saw was fourteen feet long, and eight or ten in circumference. The back of the head, the neck and shoulders, are covered with long hair, like those of the lion; the other parts of the body with short hair, like that of the horse: the colour of both is a dark brown. The female is of a light dun colour, and about half the size of the male. They live in herds near the sea-shore, and on the rocks. As this was the time for engendering, and bringing forth their young, we saw a male with twenty or thirty females about him, and he seemed very desirous of keeping them all to himself, beating off every other male who attempted to approach the flock. The sea bears are smaller than the lions, but rather larger than a common seal. All their hairs are of an equal length, something like an otter's, and the general colour is that of an iron-grey. This kind the French call sea wolves, and the English seals. They are, however, different from those in Europe and North America. The lions too may be called overgrown seals; for they are all of the same species. The hairs of the sea bears are much finer than those of lions. They permitted us to approach very near; but it was dangerous to go between them and the sea, for if they happened to take fright, they would come down in vast numbers, and run over those who could not get out of their way. They are

sluggish, sleepy animals, and downright bullies; for if waked out of their sleep they would raise up their heads, snort, snarl, and look very fierce; but when we advanced to attack them, they always ran away. This place abounds with penguins, which are amphibious birds, and so stupid, that we could knock down as many as we pleased with a stick. They are not very good eating, though we thought them so when in want of better fare. This was probably not their breeding season, for we saw neither eggs nor young ones. Here are great numbers of shags, who build their nests near the edge of the cliffs, on little hillocks; but a smaller kind, which we saw build in the cliffs of the rocks. The geese are of the same sort as those in Christmas Sound, but not in such plenty. They make a noise exactly like a duck. Here are several ducks of the sort we called race-horses: some we shot weighed thirty pounds. The sea fowls are curlews, gulls, tern, Port Egmont hens; and large brown birds, pretty good eating, which we called Molary's geese. The land birds were eagles, hawks, thrushes, and bald-headed vultures, which our sailors named Turkey buzzards. Two new species of birds were here discovered by our naturalists. One is the size of a pigeon, with a plumage white as milk, but not web-footed. When we first saw these kind of birds we took them for snow petrels, but they resemble them only in size and colour. They have a very bad smell, owing probably to their food being shell-fish and carrion, which they pick up along shore. The other sort, almost as big as a heron, resemble nearest curlews. Their plumage is variegated, their bills long and crooked, and their principal colours are light grey. All the animals of this little spot live in perfect harmony, and seem careful not to disturb each other's tranquillity. The sea lions possess most of the sea-coast; the bears take up their quarters within the isle; the shags lodge in the highest cliffs; the penguins have their separate abode where there is the most easy communication to and from the sea; and the other birds have their places of retirement; yet we have observed them all, with mutual reconciliation, mix together, like domestic cattle and poultry in a farm-yard: nay we have seen the eagles and vultures sitting together among the shags, on their hillocks, without the latter, either young or old, being disturbed at their presence.

It will be remembered, that we left Staten Island on the 3d, and this day, being Wednesday the 4th, we saw the land again, at three o'clock A. M. and at six o'clock in the afternoon a heavy squall came so suddenly upon us, that it carried away a top-gallant-mast, a studding-sail boom, and a fore studding-sail. This ended in a heavy shower of rain; and we now steered S. W. in order to discover the gulph of St. Sebastian, if such a coast existed, in which that gulph has been represented, for of this we entertained a doubt: however, this appeared to be the best course to clear it up, and to explore the southern part of this ocean. On the 5th, by observation, we were in latitude 57 deg. 9 min. and 5 deg. 2 min. E. longitude from Cape St. John. On the 6th, at eight o'clock in the evening, we were in latitude 58 deg. 9 min. S. and 53 deg. 14 min. W. the situation, nearly, assigned for the S. W. point of the gulph of St. Sebastian; but seeing no signs of land, we were still doubtful of its existence; and being also fearful, that by keeping to the south, we might miss the land said to be discovered by La Roche in 1675, and by the ship *Lion*, in 1756; for these reasons we hauled to the north, in order to get into the parallel laid down by Dalrymple as soon as possible. On the 7th, we were, near midnight, in the latitude of 56 deg. 4 min. S. longitude 53 deg. 36 min. W. On the 8th, at noon, a bed of sea-weed passed the ship; and in the afternoon we were in latitude 55 deg. 4 min. longitude 51 deg. 45 min. On Monday, the 9th, we saw a seal, and sea-weed. On the 10th, at two o'clock A. M. we bore away east, and at eight E. N. E. At noon, by observation, we were in latitude 54 deg. 35 min. S. and in 47 deg. 56 min. W. longitude. We had at this time a great number of albatrosses and blue petrels about the ship.

London. Published at the Art directors by Messrs. Lloyd, on the Tangle - June 21st, 1855, University Row.

ship. We now steered due east; and on the 11th, were in latitude 54 deg. 38 min. longitude 45 deg. 10 min. W. On the 12th, being Thursday, we steered east northerly; and at noon observed in latitude 54 deg. 28 min. S. and in 42 deg. 8 min. W. longitude, which is near 3 deg. E. of the situation, laid down by Mr. Dalrymple for the N. E. point of the gulph of St. Sebastian; but we had no other intimations of land, than seeing a seal, and a few penguins; and we had a swell from E. S. E. which we think would not have been, had any extensive track of land lay in that direction. On Friday, the 13th, we stood to the south till noon, when finding ourselves in latitude 55 deg. 7 min. we stretched to the north. We now saw several penguins, and a snow petrel, which we judged to denote the vicinity of ice. We also found the air much colder than we had felt since we left New Zealand. In the night we stood to the N. E. On Saturday, the 14th, at two o'clock, P. M. in latitude 53 deg. 56 min. 30 sec. S. and in longitude 39 deg. 24 min. W. we discovered land, in a manner wholly covered with snow. We founded in one hundred and seventy-five fathoms, muddy bottom. The land bore E. by S. distant twelve leagues. On the 15th, the wind blew in squalls, attended with snow and sleet, and we had a great sea to encounter. At past four P. M. we stood to the S. W. under two courses; but at midnight the storm abated, so that we could carry our top-sails double reefed. On the 16th, at four o'clock, A. M. we stood to the east, with a moderate breeze, and at eight saw the land extending from E. by N. to N. E. by N. At noon, by observation, we were in latitude 54 deg. 25 min. 30 sec. and in 38 deg. 18 min. W. longitude. The land was now about eight leagues distant. It proved to be an island, and we called it Willis Island, from the name of the person who first discovered it from the mast-head. It is a high rock of no great extent. We bore up to it with a view of exploring the northern coast; and as we advanced perceived another isle to the north, between that and the main. Observing a clear passage between both we steered for the same, and in the midway found it to be two miles broad. Willis's isle is in the latitude of 54 deg. S. and in 38 deg. 23 min. W. longitude. The other, which was named Bird Island, a number of fowls being seen upon the coast, is not so high, but more extensive; and is near the N. E. point of the main land, which Capt. Cook named Cape North. We saw several masses of snow, or ice, in the bottoms of some bays on the S. E. coast of this land, particularly in one which lies about three leagues to the S. S. E. of Bird isle. On Monday, the 16th, having got through the passage, we observed the north coast trended E. by N. for about three leagues, and then E. and E. by S. to Cape Buller, which is eleven miles. We ranged the coast till near night, at one league distance, when on sounding we found fifty fathoms, and a muddy bottom. On the 17th, at two o'clock, A. M. we made for the land. We now steered along shore till seven, when, seeing the appearance of an inlet, we hauled in for it. The captain accompanied by Mr. Forster, and others went off in a boat, to reconnoitre the bay before we ventured in with the ship. They landed in three different places, displayed our colours, and took possession of the country in his majesty's name. The head of the bay was terminated by ice-cliffs of considerable height; pieces of which were continually breaking off, which made a noise like a cannon. Nor were the interior parts of the country less horrible. The savage rocks raised their lofty summits till lost in the clouds, and valleys were covered with seemingly perpetual snow. Not a tree, nor a shrub of any size were to be seen. The only signs of vegetation were a strong bladed grass, growing in tufts, wild burnet, and a plant like moss, seen on the rocks. Sea-bears, or seals, were numerous: the shores swarmed with young cubs. Here were also the largest penguins we had yet seen. Some we brought aboard weighed above thirty pounds. We found the same sea-fowls as at the last island; also divers, the new

white birds, and small ones, resembling those at the Cape of Good Hope, called yellow birds, which, having shot two, we found most delicious morsels. We saw no other land birds than a few small larks, nor did we meet with any quadrupeds. The rocks bordering on the sea were not covered with snow like the inland parts; and they seemed to contain iron ore. When the party returned aboard, they brought with them a quantity of seals and penguins. Not that we wanted provisions; but any kind of fresh meat was acceptable to the crew; and even Capt. Cook acknowledged, that he was now, for the first time, heartily tired of salt diet of every kind; and that though the flesh of penguins could scarcely be compared to bullocks liver, yet its being fresh was sufficient to make it palatable. The captain named the bay he had surveyed, Possession Bay; though according to his account of it, we think it to be no desirable appendage to his majesty's new possessions. It lies in latitude 54 deg. 5 min. S. and in 37 deg. 18 min. W. eleven leagues to the east of Cape North. To the west of Possession Bay, and between that and Cape Buller, lies the Bay of Isles, so called from the number of small isles lying before and in it.

On Tuesday, the 17th, we made sail to the east, along the coast; the direction of which from Cape Buller, is 72 deg. 30 min. E. for the space of twelve leagues, to a projecting point, which was named Cape Saunders. Beyond this is a pretty large bay, which obtained the name of Cumberland Bay. At the bottom of this, as also in some other smaller ones, were vast tracks of frozen ice, or snow, not yet broken loose. Being now just past Cumberland Bay, we hauled off the coast, from whence we were distant about four miles. On the 18th, at noon, by observation, we were in latitude 54 deg. 30 min. S. and about three leagues from the coast, which stretched from N. 59 deg. W. to S. 13 deg. W. In this direction the land was an isle, which seemed to be the extremity of the coast to the east. At this time the nearest land was a projecting point, terminating in a round hillock, which, on account of the day was called Cape Charlotte; on the west side of which lies a bay, and it was named Royal Bay; and the west point we called Cape George. This is the east point of Cumberland Bay, in the direction of S. E. by E. from Cape Saunders, distant seven leagues. The Capes Charlotte and George lie in the direction of south 37 deg. E. and north 37 deg. W. six leagues distant from each other. The isle above mentioned was named Cooper's, after our first lieutenant. It is in the direction of S. by E. and eight leagues from Cape Charlotte. The coast between them forms a large bay, which we named Sandwich Bay. On the 19th, at sun-rise new land was discovered, which bore S. E. half E. At the first sight it had the appearance of a single hill, in the form of a sugar-loaf; but soon after, other detached parts were visible above the horizon near the hill. We observed at noon in latitude 54 deg. 42 min. 30 sec. S. A lurking rock, that lies off Sandwich Bay, five miles from the land, bore W. half N. distant one mile. In the afternoon we had a view of a ridge of mountains, behind Sandwich Bay, whose icy tops were elevated high above the clouds. At six o'clock, Cape Charlotte bore north 31 deg. W. and Cooper's Island W. S. W.

On Friday the 20th, at two o'clock, A. M. we made sail to the S. W. round Cooper's Island, which is one rock considerably high, about five miles in circuit, and one distant from the main. Here the main coast takes a S. W. direction for five leagues to a point, which we called Cape Disappointment, off of which are three small isles. The most southern one is a league from the Cape, green, low, and flat. From the point, as we continued our course S. W. land was seen to open in the direction of north 60 deg. W. distant beyond it nine leagues. It proved to be an isle, and was named Pickersgill Island. A point of what we had hitherto supposed to be the main, beyond this island, soon after came in sight in the direction of north 55 deg. W. which united the coast at the very point we

we had seen, and taken the bearing of, the day we first came in with it, and left us not a single doubt, that this land which we had taken for part of a great continent, was no more than an island, 210 miles in circuit. We thought it very extraordinary, that an island between the latitude of 54 and 55 degrees, should, in the very height of summer, be almost wholly covered with frozen snow, in some places many fathoms deep; but more especially the S. W. coast. Nay, the very sides of the lofty mountains, were cased with ice; but the quantity of ice and snow that lay in the valleys is incredible, and the bottoms of the bays were bounded by walls of ice of a considerable height. We are of opinion, that a great deal of the ice formed here in winter, is broken off in spring, and floats into the sea: but we question, whether a ten thousandth part of what we saw is produced in this island; from whence we are led to conclude, that the land we had seen the day before might belong to a more extensive track; and we still had hopes of discovering a continent. As to our present disappointment, we were not much affected thereby; for, were we to judge of the whole by this sample, whatever its extent might be, it would be an acquisition scarcely worth notice. This inhospitable, and dreary land, lies between the latitudes of 53 deg. 57 min. and 54 deg. 57 min. S. and between 38 deg. 13 min. and 35 deg. 34 min. W. longitude. We named this the Isle of Georgia, in honour of his Majesty. It extends S. E. by E. and N. W. by W. and is 93 miles long, and about 10 broad. The N. E. coast appears to have a number of bays, but the ice must prevent access to them the greatest part of the year; and at any time they will be dangerous harbours, on account of the continual breaking away of the ice cliffs. We are inclined to think, that the interior parts, on account of their elevation, never enjoy heat enough to melt the snow in such quantities as to produce a river; nor did we find even a stream of fresh water on the whole coast; and the N. E. side of this, only receives sufficient warmth to melt the snow. We now quitted this coast, and directed our course to the E. S. E. for the land we had seen the preceding day. A strong

gale overtook us, and we thought ourselves very fortunate in having got clear of the land before this came on.

On the 21st, the storm was succeeded by a thick fog, attended with rain; but having got a southerly breeze, we stood to the east till three in the afternoon, and then steered north in search of the land. On the 22d, we had thick foggy weather; but in the evening it was so clear that we could see two leagues round us; and thinking we might be to the east of the land, we steered west.

On the 23d, a thick fog at six o'clock, A. M. once more compelled us to haul the wind to the south; but at eleven, we were favoured with a view of three or four rocky islets, extending from S. E. to E. N. E. about one league distant; and this, being the extent of our horizon, might be the reason why we did not see the sugar-loaf peak before mentioned. We were well assured, this was the land we had seen before, and which we had now circumnavigated; consisting of only a few detached rocks, the receptacles for birds. They are situated in latitude 55 deg. S. 12 leagues from Cooper's Isle, and we named them Clerk's Rocks, Mr. Clerk, one of our lieutenants having first discovered them. This interval of clear weather was succeeded by as thick a fog as ever, on which we stood to the north. Thus we were continually involved in thick mists, and the flags with frequent soundings were our best pilots; but on the 23d we stood a few miles to the north, when we got clear of rocks, out of soundings, and saw not any flags.

On the 24th, we saw the rocks bearing S. S. W. half W. distant four miles, but we did not still see the sugar-loaf peak. At four o'clock, P. M. judging ourselves to be three or four leagues E. and W. of them, we steered south, being quite tired with cruising in thick fogs, only to have a sight of a few straggling rocks. Having, at intervals, a clear sky to the west, at seven o'clock we saw the isle of Georgia, bearing W. N. W. distant eight leagues: at eight we steered S. E. by S. and at ten S. E. by E.

C H A P. IX.

The Resolution continues her course—Newland and Saunders Isles discovered—Conjectures, and some reasons that there may be land about the South Pole—The Resolution alters her course south to the east—Endeavours to find Cape Circumcision—Observations on what she had done in the voyage—Proceedings till her arrival at the Cape of Good Hope—Sails for the isle of Fayal—And returns to England—Capt. Furneaux's narrative, from the time the Adventure was separated from the Resolution, to her arrival in England, including the report of Lieut. Burney, concerning the untimely death of the boat's crew who were murdered by some of the natives of Queen Charlotte's Sound, in New Zealand.

ON Wednesday the 25th, we steered E. S. E. We had a fresh gale at N. N. E. but the weather still continued foggy, till towards the evening, at which time it cleared up. On the 26th, we held on our course with a fine gale from the N. N. W. but at day-light, seeing no land to the east, and being in latitude 56 deg. 33 min. S. and in 31 deg. 10 min. W. longitude, we steered south. On the 27th, at noon, we were in the latitude of 59 deg. 46 min. S. and had so thick a fog that we could not see a ship's length. We expected soon to fall in with the ice, and on this account, it being no longer safe to sail before the wind, we hauled to the east with a gentle gale at N. N. E. When the fog cleared away, we resumed our course to the south; but it returned again, which obliged us to haul upon a wind. By our reckoning we were now in the latitude of 60 deg. S. and unless we discovered some certain signs of soon falling in with land, the Captain determined to make this the limit of his voyage to the south. Indeed it would not have been prudent to have squandered away time in proceeding farther to the south, when there was as great a probability of finding a large track of land near Cape Circumcision. Besides it was an irksome task to traverse in high southern lati-

tudes, where nothing was to be discovered but ice. At this time a long hollow swell from the west, indicated that no land was to be expected in such a direction; and upon the whole, we may venture to assert, that the extensive coast laid down by Mr. Dalrymple, and his Gulph of St. Sebastian, do not exist. The fog having receded from us a little, at seven o'clock in the evening, we saw an ice-island, penguins, and snow peterels. In the night, being visited with a return of the fog, we were obliged to go over again that space which we had, in some degree, made ourselves acquainted with in the day.

On the 28th, at eight o'clock, A. M. we stood to the east, with a gentle breeze at north. The weather cleared away, and we perceived the sea strewed with large and small bodies of ice. Some whales, penguins, snow peterels, and other birds were seen. We had now sun-shine, but the air was cold. At noon, by observation, we were in 60 deg. 4 min. S. and in 29 deg. 23 min. W. longitude. At half past two o'clock, having continued our course to the east, we suddenly fell in with a vast number of large ice-islands, and a sea strewed with loose ice, and the weather becoming hazy, made it dangerous to stand in among them. We

We therefore tacked, and stood back to the west, with the wind at north. We were now surrounded with ice-islands, all nearly of an equal height, with a flat level surface; but of various extent. The loose ice, with which the sea appeared strewed, had broke from these isles.

On Sunday the 19th, having little wind, we were obliged to traverse in such courses, as were most likely to carry us clear of them, so that we hardly made any progress, one way or other, throughout the whole day. The weather was fair, but remarkably gloomy, and we were visited by penguins and whales in abundance. On the 30th, we tacked and stood to the N. E. and almost throughout the day it was foggy, with either sleet or snow. At noon we were in latitude 59 deg. 30 min. S. and in 29 deg. 24 min. W. At two o'clock, passed one of the largest ice-islands we had seen during our voyage; and some time after two smaller ones. We now stood to N. E. over a sea strewed with ice. On the 31st we discovered land ahead, distant about one league. We hauled the wind to the north; but not being able to weather it, we tacked in 175 fathoms water, a league from the shore, and about half a one from some breakers. This land consisted of three rocky islets of considerable height. The outmost terminated in a lofty peak, like a fugar-loaf, to which we gave the name of Freezland Peak, after the man who first discovered it. The latitude is 59 deg. S. and 27 deg. W. longitude. To the east of this peak, was seen an elevated coast, whose snow-cap'd summits were above the clouds. It extended from N. by E. to E. S. E. and we named it Cape Bristol, in honour of the noble family of Harvey. Also in latitude 59 deg. 13 min. 30 sec. S. and in 27 deg. 45 min. W. another elevated coast appeared in sight, bearing S. W. by S. and at noon, it extended from S. E. to S. S. W. distant from four to eight leagues. This land we called Southern Thule, because the most southern that has yet been discovered. Its surface rises high, and is every where covered with snow. There were those of our company, who thought they saw land in the space between Thule and Cape Bristol. We judged it more than probable that these two lands are connected, and the space is a deep bay, which, though these are mere suppositions, was called Forster's Bay. Being not able to weather Southern Thule, we tacked and stood to the north, at one o'clock, and at four Freezland Peak was distant four leagues. Soon after the wind fell, and we were left to the mercy of a great westerly swell, which set right upon the shore; but at eight o'clock, the weather clearing up, we saw Cape Bristol, which bore E. S. E. ending in a point to the north, beyond which we could see no land. Thus we were relieved from the fear of being carried away by the swell, and cast on the most horrible coast in the world. We continued our course to the north all night, with a light breeze at west.

On Wednesday the first of February, at four o'clock in the morning, we had a view of a new coast. At six it bore north 60 deg. E. and being a high promontory, we named it Cape Montague. It is situated in latitude 58 deg. 27 min. S. and in 26 deg. 44 min. W. longitude; eight leagues to the north of Cape Bristol. We saw land in several places between them, whence we concluded the whole might be connected. We wish it had been in our power to have determined this with greater certainty, but prudence would not permit the attempt, nor to venture near a coast the dangers of which have been already sufficiently pointed out. One ice-island, among many others on this coast, particularly attracted our notice. It was level in surface, of great extent both in height and circuit, and its sides were perpendicular, on which the waves of the sea had not made the least impression. We thought it might have come out from some bay in the coast. At noon we were east and west of the northern part of Cape Montague, distant five leagues. Freezland Peak was 12 leagues, and bore south 16 deg. E. By observation we found our latitude to be 58 deg. 25 min. In the afternoon, at two o'clock, when standing to the north we saw land, which bore north 25 deg. E. It extend-

No. 22.

ed from north 40 deg. to 52 deg. E. and it was imagined more land lay beyond it to the east. Cape Montague at this time bore south 66 deg. E. at eight 40 deg. and Cape Bristol S. by E.

On the 2nd, at six o'clock A. M. having steered to the north during the night, new land was discovered, bearing north 12 deg. E. distant 10 leagues. We saw two hummocks just above the horizon, of which we soon lost sight. We now stood, having a fresh breeze at N. N. E. for the northernmost land we had seen the preceding day, which, at this time, bore E. S. E. By ten o'clock we fetched in with it, but not having it in our power to weather the same, we tacked at three miles from the coast. This extended from E. by S. to S. E. and appeared to be an island of about 10 leagues circuit. The surface was high, and its summit lost in the clouds. Like all the neighbouring lands, it was covered with a sheet of snow and ice, except on a point on the north side, and on two hills seen over it, which probably were two islands. These were not only clear of snow, but seemed covered with green turf. We saw also large ice-islands to the south, and others to the N. E. At noon we tacked for the land again, in order if possible to determine whether it was an island; but a thick fog soon prevented the discovery, by making it unsafe to stand in for the shore; so that having returned, we tacked and stood to N. W. to make the land we had seen in the morning. We left the other under the supposition of its being an island, and named it Saunders Isle, after Capt. Cook's honourable friend Sir Charles Saunders. It lies in latitude 57 deg. 49 min. S. and in 26 deg. 44 min. W. longitude, distant 13 leagues from Cape Montague. The wind having shifted at six o'clock, we stood to the north; and at eight we saw Saunders Island, extending from S. E. by S. to E. S. E. We were still in doubt if it were an island, and could not at this time clear it up, as we found it necessary to take a view of the land to the north, before we proceeded any farther to the east. With this intent we stood to the north, and on the 3d, at two o'clock A. M. we came in sight of the land we were searching after, which proved to be two isles. On account of the day on which they were discovered, we called them Candlemas Isles. They lie in latitude 57 deg. 11 min. S. and in 27 deg. 6 min. W. longitude. Between these we observed a small rock; there may perhaps be others; for the weather being hazy occasioned us to lose sight of the islands, and we did not see them again till noon, at which time they were three or four leagues off. We were now obliged, by reason of the wind having veered to the south, to stand to the N. E. and at midnight came suddenly into water uncommonly white, at which appearance the officer on watch was so much alarmed, that he immediately ordered the ship to be put about, and we accordingly tacked instantly. There were various opinions aboard concerning this matter; probably it might be a shoal of fish; but some said it was a shoal of ice; and others thought it was shallow water.

On Sunday the 4th, at two o'clock, A. M. we resumed our course to the east, and at six tried if there were any current, but found none. At this time some whales were playing, and numbers of penguins flying about us: of the latter we shot a few, different from those on Staten Land, and at the Isle of Georgia. We had not seen a seal since we left that coast, which is somewhat remarkable. By observation at noon, we found ourselves in latitude 56 deg. 44 min. S. and in longitude 25 deg. 33 min. W. We now having a breeze at east, stood to the south, intending to regain the coast we had lost; but the wind at eight o'clock in the evening, obliged us to stand to the east, in which run we saw many ice-islands, and some loose ice. As the formation of ice-islands has not been fully investigated, we will here offer a few hints and observations respecting them. We do not think, as some others do, that they are formed by the water at the mouths of great cataracts or large rivers, which, when accumulated, break off, owing to their ponderous weight; because we never found any of the ice, which we took up, in

the least incorporated, or connected with earth, which must necessarily adhere to it, were this conjecture true. Furthermore, we are not certain whether there are any rivers in these countries, as we saw neither rivers nor streams of fresh water there. The ice-islands, at least in those parts, must be formed from snow and fleet consolidated, which gathers by degrees, and are drifted from the mountains. In the winter, the seas or the ice cliffs must fill up the bays, if they are ever so large. The continual fall of snow occasions the accumulation of these cliffs, till they can support their weight no longer, and large pieces break off from these ice-islands. We are inclined to believe, that these ice cliffs, where they are sheltered from the violence of the winds, extend a great way into the sea.

On the 5th, having seen no penguins, we thought that we were leaving land behind us, and that we had passed its northern extremity. At noon we were 3 deg. of longitude, to the east of Saunders' Isle; and by observation in the latitude of 57 deg. 8 min. S. and in 23 deg. 34 min. W. longitude. In the afternoon we again stretched to the south, in order that we might again fall in with the land, if it took an east direction.

On Monday the 6th, we held on our course till the 7th at noon, when we found our latitude to be 58 deg. 15 min. S. and longitude 21 deg. 34 min. W. and not seeing any signs of land, we concluded, that what had been denominated Sandwich Land, was either a group of islands, or a point of the continent: for in Capt. Cook's opinion, the ice that is spread over this vast Southern Ocean, must originate in a track of land, which he firmly believes lies near the pole, and extends farthest to the north, opposite the Southern Atlantic and Indian Oceans; for ice being found in these farther to the north, than any where else, induced the Captain to conclude, that land of considerable extent must exist near the south. Upon a contrary supposition it will follow, that we ought to see ice every where under the same parallel; but few ships have met with ice going round Cape Horn; and for our part, we saw but little below the sixtieth degree of latitude in the Southern Pacific Ocean; on the other hand in this sea, between the meridian of 40 deg. W. and fifty or sixty degrees east, we found ice as far north as 51 deg. Others have seen it in a much lower latitude. Let us now suppose there is a Southern Continent within the polar circle. The question which readily occurs, will be; What end can be answered in discovering or exploring such a coast? Or what use can the same be either to navigation, geography, or any other science? And what benefits can result therefrom to a commercial state? Consider for a moment, what thick fogs, snow, storms, intense cold, and every thing dangerous to navigation, must be encountered with by every hardy adventurer; behold the horrid aspect of a country impenetrable by the animating heat of the sun's rays; a country doomed to be immersed in everlasting snow. See the islands and floats on the coast, and the continual falls of the ice cliffs in the ports: these difficulties, which might be heightened by others not less dangerous, are sufficient to deter every one from the rash attempts of proceeding farther to the south, than our expert and brave commander has done, in search of an unknown country, which when discovered would answer no valuable purpose whatever. By this time we had traversed the Southern Ocean, in such a manner, as to have no doubt in determining that there is no continent, unless near the pole, and out of the reach of navigation. We have made many new discoveries, and ascertained the exact situation of several old ones. Thus was the end of our voyage fully answered, a southern hemisphere sufficiently explored, and the necessity of a search after a southern continent put an end to. We should have proceeded to farther discoveries, but our Captain thought it cruel to detain the people who sailed with him any longer without the necessary refreshments, especially, as their behaviour merited every indulgence; for neither officers nor men ever once repined at any hardship, nor expressed any uneasiness, or additional

fear of danger, on account of our separation from the Adventure. It was now high time to think of returning home; and could we have continued longer, we should have been in great danger of the scurvy breaking out among us, and we do not know any good purpose farther discoveries would have answered; we therefore steered for the Cape of Good Hope, intending to look for Bouvet's discovery, Cape Circumcision, and the isles of Denia and Marfeven. But before we continue the narrative of this voyage, it may not be thought improper to collect a few observations from our most eminent writers, on Terra Magellanica, Patagonia, part of which coast lies within the straits, the Island of Terra del Fuego; and Falkland's Islands.

Terra Magellanica received its name from Ferdinand Magellan, a Portuguese officer; who likewise gave name to those straits which lead from the south to the north sea, he being the first who sailed through them. The appellation of Patagonia was derived from a principal tribe of its inhabitants, called Patagons. The whole country, which goes under the name of Patagonia, extends from Chili and Paraguay to the utmost extremity of South America, that is, from 35 almost to 54 degrees of south latitude, being 700 miles long, and 300 broad where widest. The northern parts contain an almost inexhaustible stock of large timber, but in the southern districts there is scarcely a tree to be seen fit for any mechanical purpose. The lofty mountains, called the Andes, traverse the whole country from north to south.

Here are incredible numbers of wild horned cattle and horses, which were first brought hither by the Spaniards, and have increased amazingly; the pasturage also is good. Some writers tell us that fresh water is scarce; but were that the case, we cannot see how the present inhabitants, and such multitudes of cattle could subsist. The east coast is chiefly low-land, with few or no good harbours; that called St. Julian is one of the best.

The inhabitants of Patagonia consist of several Indian tribes, as the Pitagons, Pampas, Cossares, &c. They are a savage, barbarous people, of a copper colour, like the rest of the Americans, with coarse black hair, and no beards. They are mightily addicted to painting themselves, and make streaks on their faces and bodies. They go almost stark naked, having only a square garment, in the form of a blanket, made of the skins of several animals, and sewed together, which they sometimes wrap round them in extreme cold weather; and they have also a cap of the skins of fowls on their heads. Former voyagers represented them as monstrous giants of 11 feet high, whereas they are no taller than the other Americans. The women, as in other places, are very fond of necklaces and bracelets, which they make of sea shells. The natives chiefly live on fish and game, and what the earth produces spontaneously. This country abounds with an animal called camel-sheep by some authors, but their true name is guanaco. They partake of the nature of a camel, though they have no bunch on the back, and they were formerly made use of to carry burdens. They have also a bird called an ostrich, but not so large, and they differ from the African ostriches in having three toes, whereas those have but two. A great number of islands, or clusters of islands, lie on the coasts of Patagonia.

The island of Terra del Fuego, or the Land of Fires, as it was called by the first discoverers, on account of their having observed some great fires upon it (supposed to be volcanoes) as they passed it in the night, is separated from the continent by the Magellanic Straits; has a rough appearance, being very mountainous, but is intersected with deep narrow vallies, and is well watered. The natives of this country are short in their persons, not exceeding five feet six inches at most, their heads large, their faces broad, their cheek-bones very prominent, and their noses very flat. They have little brown eyes, without life; their hair is black and lank, hanging about their heads in disorder, and besmeared with train oil. On the chin they have a few straggling short hairs instead of a beard, and from their nose there

London: Published as the Act directs by Isaac Hogg, at the Kings Arms, No. 10, Parmenter Row.

THE SECOND VOYAGE OF THE COCKERELL IN 1827

is a constant discharge of mucus into their ugly open mouth. The whole assemblage of their features forms the most loathsome picture of misery and wretchedness to which human nature can possibly be reduced. They had no other clothing than a small piece of seal-skin, which hung from their shoulders to the middle of the back, being fastened round the neck with a string. The rest of their body was perfectly naked, not the least regard being paid to decency. Their natural colour seems to be an olive-brown, with a kind of gloss resembling that of copper; but many of them disguise themselves with streaks of red paint, and sometimes, though seldom, with white. Their whole character is the strongest compound of stupidity, indifference, and inactivity. They have no other arms than bows and arrows, and their instruments for fishing a kind of fish-gags. They live chiefly on seals flesh, and like the fat oily part most. There is no appearance of any subordination among them, and their mode of living approaches nearer to that of brutes, than that of any other nation. The children go naked, and the only weapon of the men is a long stick generally hooked, and pointed at the end like a lance. They live in huts made of boughs, and covered with mud, branches, &c. One side is open, and the fire place is in the middle; and a whole family herd together in one of these miserable hovels.

The above-mentioned islands are all very barren and mountainous; but from what Mr. Forster says, in his voyage to the South Sea, the climate would not appear to be so rigorous and tempestuous as it is represented in Anson's voyage. Upon the lower grounds and islands, that were sheltered by the high mountains, several sorts of trees and plants, and a variety of birds, were found. Among the trees, was Winter's bark-tree, and a species of arbutus, loaded with red fruit of the size of small cherries, which were very well tasted. In some places there is also plenty of celer. Among the birds was a species of duck of the size of a goose, which ran along the sea with amazing velocity, beating the water with its wings and feet: it had a grey plumage, with a yellow bill and feet, and a few white quill feathers: at the Falkland islands it is called a loggerhead duck. Among the birds are also plenty of geese and falcons. The rocks of some of the islands are covered with large muscle-shells, the fish of which is said to be more delicate than oysters.

Falkland's islands were first discovered in 1594. by Sir Richard Hawkins, who named the principal of them Hawkins' Maidenland, in honour of queen Elizabeth. The present name Falkland was probably given them by Capt. Strong, in 1689, and afterwards adopted by Halley.

The late lord Egmont, first lord of the Admiralty in 1764, then revived the scheme of a settlement in the South Seas; and commodore Byron was sent to take possession of Falkland's islands in the name of his Britannic majesty, and in his journal represents them as a valuable acquisition. On the other hand, they are represented by Capt. McBride, who in 1766 succeeded that gentleman, as the outcasts of nature: "We found (says he) a map of islands and broken lands, of which the soil was nothing but a bog, with no better prospect than that of barren mountains, beaten by storms almost perpetual. Yet this is summer; and if the winds of winter hold their natural proportion, those who lie but two cables length from the shore, must pass weeks without any communication with it." The herbs and vegetables which were planted by Mr. Byron's people; and the fir-tree, a native of rugged and cold climates, had withered. In the summer-months, wild celer and sorrel are the natural luxuries of these islands. Goats, sheep, and hogs that were carried hither, were found to increase and thrive as in other places. Geese of a fishy taste, snipes, penguins, foxes, and sea lions, are also found here, and plenty of good water.

Though the soil be barren, and the sea tempestuous, an English settlement was made here, of which we were dispossessed by the Spaniards in 1770. That violence

was, however, disavowed by the Spanish ambassadors, and some concessions were made to the court of Great Britain; but in order to avoid giving umbrage to the court of Spain, the settlement was afterwards abandoned.

On Tuesday, the 7th, we resumed our course to the east, and this day only three ice islands were seen. At eight o'clock in the evening, we hauled the wind to the S. E. for the night. On the 8th, at day-light, we continued our course to the east, being in latitude 58 deg. 30 min. S. and in 15 deg. 14 min. W. longitude. In the afternoon passed three ice islands. On the 9th, we had a calm most part of the day; the weather fair, except at times a snow shower. We saw several ice islands, but not the least intimation that could induce us to think that any land was near us. We stood now to N. E. with a breeze which sprung up at S. E. On the 10th, we had showers of sleet and snow; the weather was piercing cold, inasmuch that the water on deck was frozen. The ice-islands were continually in sight. On the 11th, we continued to steer east. In the morning we had heavy showers of snow; but as the day advanced, we had clear and serene weather. At noon we were in latitude 58 deg. 11 min. and in 7 deg. 55 min. W. longitude. On the 12th, we had ice islands continually in sight, but most of them were small and breaking to pieces. On Monday, the 13th, we had a heavy fall of snow; but, the sky clearing up, we had a fair night, and so sharp a frost, that the water in all our vessels on deck, was next morning covered with a sheet of ice. On the 14th, we continued to steer east, inclining to the north, and in the afternoon crossed the first meridian, or that of Greenwich, in the latitude of 57 deg. 50 min. S. At eight o'clock we had a hard gale, at S. S. W. and a high sea from the same quarter. On the 15th, we steered E. N. E. till noon, when by observation, we were in latitude of 56 deg. 37 min. S. and in 4 deg. 11 min. E. longitude. We now sailed N. E. with a view of getting into the latitude of Cape Circumcision. We had some large ice-islands in sight, and the air was nearly as cold as the preceding day. The night was foggy, with snow showers, and a smart frost. On Thursday, the 16th, we continued our course N. E. and at noon we observed in latitude 55 deg. 26 min. S. and in 5 deg. 52 min. E. longitude, in which situation we had a great swell from the south, but no ice in sight. At one o'clock we stood to S. E. till six, when we tacked, and stood to the north. At this time we had a heavy fall of snow and sleet, which fixed to the masts and rigging as it fell, and coated the whole with ice. On the 17th, we had a great high sea from the south, from whence we concluded no land was near in that direction. At this time were in latitude 54 deg. 20 min. S. and in 6 deg. 33 min. E. longitude. On the 18th, the weather was fair and clear. We now kept a look-out for Cape Circumcision; for if the land had ever so little extent in the direction of N. and S. we could not miss seeing it, as the northern point is said to lie in 54 deg. On the 19th, at eight o'clock in the morning, land appeared in the direction east by south, but it proved a mere fog-bank. We now steered east by south and S. E. till seven o'clock in the evening, when we were in latitude 54 deg. 42 min. S. and in 13 deg. 3 min. E. longitude. We now stood to N. W. having a very strong gale, attended with snow showers. On Monday, the 20th, we tacked and stretched to N. E. and had a fresh gale attended with snow showers and sleet. At noon we were in latitude 54 deg. 8 min. S. longitude 12 min. 59 min. E. but had not the least sign of land. On the 21st, we were 5 deg. to the east of the longitude in which Cape Circumcision is said to lie, and continued our course east, inclining a little to the south, till the 22nd, when, at noon, by observation we were in latitude 54 deg. 24 min. S. and in 19 deg. 18 min. E. longitude. We had now measured in the latitude laid down for Bouvet's land, thirteen degrees of longitude; a course in which it is hardly possible we could have missed it; we therefore began to doubt its existence; and concluded, that what the Frenchman had seen, could be nothing more

more than a deception, or an island of ice: for after we had left the southern isles, to the present time, not the least vestige of land had been discovered. We saw, it is true, some seals, and penguins; but these are to be found in all parts of the southern ocean, and we believe shags, gannets, boobies, and men of war birds, are the most indubitable signs that denote the vicinity of lands, as they seldom go very far out to sea. Being at this time only two degrees of longitude from our route to the south, when we took our departure from the Cape of Good Hope, it was in vain for us to continue our course to the east, under this parallel; but thinking we might have seen land farther to the south, for this reason, and to clear up some doubts, we steered S. E. in order to get into the situation in which it was supposed to lie. On the 23d, from observations on several distances of the sun and moon, we found ourselves in the latitude of 55 deg. 25 min. S. and in 23 deg. 22 min. E. longitude; and having run over the track in which the land was supposed to lie, without seeing any, we now was well assured the ice-islands had deceived Mr. Bouvet; as at times they had deceived us. During the night the wind veered to N. W. which enabled us to steer more north; for we had now laid aside all thoughts of searching farther after the French discoveries, and were determined to direct our course for the Cape of Good Hope, intending only by the way to look for the isles of Denia, and Marfeveen, which by Dr. Halley are laid down in the latitude of 41 deg. 5 min. and 4 deg. E. longitude from the meridian of the Cape of Good Hope. On Friday the 25th, we steered N. E. and were at noon in latitude 52 deg. 52 min. S. longitude 26 deg. 31 min. E. This day we saw the last ice-island.

On Wednesday, the first of March, we were in latitude 46 deg. 44 min. S. and in 23 deg. 36 min. W. longitude; and we took notice, that the whole time the wind blew regular and constant northerly, which included several days, the weather was always cloudy and very hazy; but as soon as it came south of west, it cleared up. We also observed, that the barometer began to rise several days before this change happened. On the 3d, in the afternoon, we had intervals of clear weather, but at night the wind blew a heavy squall from S. W. whereby several of our sails were split, and a middle stay-sail was wholly lost. Our latitude was 45 deg. 8 min. S. longitude 30 deg. 50 min. E. On Wednesday, the 8th, the thermometer rose to 61 deg. and we were obliged to put on lighter cloaths. We were now in latitude 41 deg. 30 min. S. longitude 26 deg. 51 min. E. We had not yet seen any signs of land, but albatrosses, peterels, and other sea birds, were our daily visitors. On the 11th, the wind shifted suddenly from N. W. to S. W. which occasioned the mercury to fall as suddenly from 62 to 52 deg. so different was the state of the air between a northerly and southerly wind. Our latitude this day was 40 deg. 40 min. S. longitude 23 deg. 47 min. E.

On Sunday, the 12th, some albatrosses and peterels were shot, which proved an acceptable treat. This day we were nearly in the situation, in which the isles of Denia and Marfeveen are said to lie, and not the least hope of finding them remained. On the 13th, we stood to N. N. W. and at noon, by observation, were in latitude 38 deg. 51 min. S. which was above thirty miles more than our log gave us; to what this difference was owing, we could not determine. The watch also shewed that we had been set to the east. At this time we were two degrees north of the parallel in which the isles are laid down, but found not any encouragement to persevere in our endeavours to find them. This must have consumed more time, we think, in a fruitless search; and every one, all having been confined a long time to stale and salt provisions, was impatient to get into port. We therefore, in compliance with the general wish, resolved to make the best of our way to the Cape of Good Hope. We were now in latitude 38 deg. 38 min. S. and in 23 deg. 37 min. E. longitude.

On Thursday, the 16th, at day-break, we descried

in the N. W. quarter, standing to the westward, two sail, one of which shewed Dutch colours. At ten o'clock we stood to the west also, and were now in the latitude of 35 deg. 9 min. S. and in longitude 22 deg. 38 min. E. About this time, a quarrel arose between three officers, and the ship's cooks, which was not reconciled without serious consequences. Those three gentlemen, upon some occasion or other, entered the cook-room with naked knives, and with oaths, unbecoming their character, swore they would take away the lives of the first who dared to affront them. It seems they had formerly met with some rebuffs for too much frequenting the cooks apartments, which had hitherto passed in joke; but now a regular complaint was laid before the captain, of their unwarrantable behaviour, and of the danger the men were in of their lives; into which complaint the captain was under a necessity of enquiring; and upon finding it just, of confining the offenders in irons. While they were in this situation, the articles of war being read, it was found that the offence was of such a nature as hardly to be determined without a reference to a court martial, in order to which the two who appeared most culpable, were continued prisoners upon parole, and the third was cleared. After this business had engrossed the Captain's attention, he called the ship's crew together, and after recounting the particulars of the voyage, the hardships they had met with, the fatigues they had undergone, and the cheerfulness they had constantly shewn in the discharge of their duty, he gave them to understand, how much it would still more recommend them to the Lords of the Admiralty, if they would preserve a profound silence in the ports they had yet to pass and might enter, with regard to the courses, the discoveries they had made, and every particular relative to this voyage; and likewise, after their return home, till they had their lordships permission to the contrary; requiring, at the same time, all those officers who had kept journals to deliver them into his custody, to be sealed up, and not to be opened till delivered to their lordships at the proper office. In the interim they were to be locked up safely in a chest. This request was cheerfully complied with by every commissioned officer.

On Friday, the 17th, we observed at noon in the latitude of 34 deg. 49 min. S. in the evening we saw land, about six leagues distant, in the direction of E. N. E. And there was a great fire or light upon it, throughout the first part of the night. On the 18th, at day-break, we saw, at the same distance, the land again, bearing N. N. W. At nine o'clock, we sent out a boat to get up with one of the two ships before noticed; we were so desirous of hearing news, that we paid no attention to the distance, though the ships were at least two leagues from us. Soon after we stood to the south, a breeze springing up at west. At this time three more sail were seen to windward, one of which shewed English colours. The boat returned at one o'clock P. M. and our people in it had been on board a Dutch Indiaman, coming home from Bengal; the ship was the Bownkerk Polder, the Captain Cornelius Bofsch. The captain very politely made us a tender of sugar, arrack, and of any thing that could be spared out of the ship. By some English mariners on board her, our people were informed, that our comfort had arrived at the Cape of Good Hope twelve months ago; adding, that a boat's crew had been murdered and eaten by the natives of New Zealand. This intelligence sufficiently explained the mysterious accounts we had received from our old friends, in Queen Charlotte's Sound.

On the 19th, at ten o'clock in the morning, the English ship bore down to us. She was the *True Briton*, Capt. Broadly, on her return from China. A letter to the secretary of the Admiralty was committed to the care of the captain, who generously sent us fresh provisions, tea, and other articles. In the afternoon, the *True Briton* stood out to sea, and we in for land. At six o'clock, we were within five miles of the shore, distant, as we conjectured, about six leagues from Cape Aquilas.

Aquilas. On the 20th, we stood along shore to the west; and on the 21st, at noon, the Table Mountain, over the Cape Town, bore N. E. by E. distant ten leagues. The next morning we anchored in Table Bay; with us, in our reckoning, it was Wednesday the 22nd, but with the people here, Tuesday the 21st, we having gained a day by running to the east. In the bay we found ships of different nations, among which was an English East Indiaman, from China, bound directly to England. In this ship Capt. Cook sent a copy of his journal, together with some charts and drawings to the Admiralty. We saluted the garrison with thirteen guns, and the compliment was returned with an equal number. We now heard the deplorable story of the Adventure's boat's crew confirmed, with the addition of a false report, concerning the loss of a French ship upon the same island, with the total destruction of the captain and his crew, propagated, no doubt, by the Adventure's people, to render an act of savage barbarity, that would scarcely admit of aggravation, still more horrible. But, which gave us full satisfaction about this matter, Capt. Furneaux had left a letter for our commander, in which he mentions the loss of the boat, and ten of his men, in Queen Charlotte's Sound. The day after our arrival at this place, Capt. Cook, accompanied by our gentlemen, waited on Baron Plettenberg, the Dutch Governor, by whom, and his principal officers, they were treated with the greatest politeness; and as at this place refreshments of all kinds may be procured in great abundance, we began, after the numerous fatigues of a long voyage, to taste, and enjoy the sweets of repose. It is a custom here for all the officers to reside on shore; in compliance with which, the captain, the two Forsters, and Mr. Sparrman took up their abode with Mr. Brandt, well known to our countrymen for his obliging readiness to serve them. Our people on board were not neglected: and being provided daily with fresh baked bread, fresh meat, greens, wine, &c. they were soon restored to their usual strength, and as soon forgot all past hardships and dangers.

All hands were employed now to supply all our defects. Almost every thing except the standing rigging was to be replaced anew; and it is well known the charges here for naval stores are most exorbitant; for the Dutch both at the Cape and Batavia, take a scandalous advantage of the distress of foreigners. That our masts, rigging, sails, &c. should be in a shattered condition, is easily accounted for. In circumnavigating the globe, we mean, from leaving this place to our return to it again, we had sailed no less than sixty thousand miles, equal nearly to three times the equatorial circumference of the earth; but in all this run, which had been made in all latitudes, between 9 and 71 deg. we sprung neither low-masts nor top-mast; nor broke so much as a lower, or top-mast shroud. At the Cape, the curiosity of all nations was excited, to learn the success of our discoveries, and in proportion to the earnestness of the solicitations, wherewith the common men were pressed, by foreign inquisitors, they took care to gratify them with wonderful relations. Hence many strange stories were circulated abroad, before it was known by the people at large at home, whether the Resolution had perished at sea, or was upon her return to Europe. During our stay here several foreign ships put in and went out, bound to and from India, namely, English, French, Danes, and three Spanish ships, frigates, two going to, and one returning from Manilla. We believe it is but lately, that ships of this nation have touched here; and these were the first to whom were allowed the same privileges as other European states. We now lost no time in putting all things in readiness to complete our voyage; but we were obliged to unhang our rudder, and were also delayed for want of caulkers; and it was absolutely necessary to caulk the ship before we put to sea.

On Wednesday, the 26th of April, this work was finished, and having got on board a fresh supply of provisions, and all necessary stores, we took leave of the

No. 23.

governor, and his principal officers. On the 27th, we went on board, and soon after, the wind coming fair, we weighed, and put to sea. When under sail, we saluted the garrison, as is customary, and they returned the compliment. When clear of the bay we parted company with some of the ships who sailed out with us: the Danish ship steered for the East-Indies, the Spanish frigate, Juno, for Europe, and we and the Dutton Indiaman, for St. Helena. Depending on the goodness of Mr. Kendal's watch, we determined to attempt to make the island by a direct course. The wind, in general, blew faint all the passage, which made it longer than common.

On Monday the 15th of May, at day-break, we saw the island, distant fourteen leagues, and anchored at midnight, before the town, on the N. W. side of the island. Governor Skettowe, and the gentlemen of the island, treated us, while we continued here, with the greatest courtesy. In our narrative of Capt. Cook's former voyage, we have given a full description of this island; to which we shall only add, that the inhabitants are far from exercising a wanton cruelty towards their slaves. We are informed also, that wheel carriages, and porters knots have been in use among them for many years. Within these three years a new church has been built; some other new buildings are erecting, a commodious landing-place for boats has been made, and other improvements, which add both strength and beauty to the place. Here we finished some necessary repairs, which we had not time to complete during our stay at the Cape. Our empty water casks were also filled, and the ship's company had fresh beef, at five-pence per pound. This article of refreshment is exceeding good, and the only one to be procured, worth mentioning. On the 21st, in the evening, we took leave of the governor, and then repaired on board. The Dutton Indiaman, in company with us, was ordered not to fall in with Ascension, for which we steered, on account of an illicit trade, carried on between the Company's ships, and some vessels from North America; who, of late years, had visited the island, on pretence of fishing, when their real design was to wait the coming of the India ships. The Dutton was therefore ordered to steer N. W. by W. or N. W. till to the northward of Ascension. With this ship we were in company till the 24th, when we parted. A packet for the Admiralty was put on board, and she continued her course N. W. On Sunday, the 28th, we made the island of Ascension, and on the evening anchored in Cross Bay, on the N. W. side, half a mile from the shore, in ten fathoms water. The Cross-hill, so called on account of a flag staff erected upon it in form of a cross, bore S. 38 deg. E. and the two extreme points of the bay extended from N. E. to S. W. We had several fishing parties out every night, and got about twenty-four turtle weighing between four and five hundred weight each. This was our principal object, though we might have had a plentiful supply of fish in general. We have no where seen old wives in such abundance; also cavalies, conger eels, and various other sorts.

This island lies in the direction N. W. and S. E. and is ten miles broad, and five or six long. Its surface is very barren, and scarcely produces a shrub, plant, or any kind of vegetation, in the space of many miles; instead of which we saw only stones and sand, or rather flags and ashes: hence from the general appearance of the face of this island, it is more than probable, that, at some time, of which we have no account, it has been destroyed by a volcano. We met with in our excursions a smooth even surface in the intervals between the heaps of stones; but as one of our people observed, you may as easily walk over broken glass bottles as over the stones; for if you slip, or make a false step, you are sure to be cut or lamed. At the S. E. end of the isle is a high mountain, which seems to have been left in its original state; for it is covered with a kind of white marl, producing purslain, spurge, and one or two sorts of grass. On these the goats feed, which are to

3 C

be

be found in this part of the isle. Here are good land crabs, and the sea abounds with turtle from January to June. They always come on shore to lay their eggs in the night, when they are caught by turning them on their backs, in which position they are left on the beach till the next morning when the turtle-catchers fetch them away. We are inclined to think, that the turtles come to this island merely for the purpose of laying their eggs, as we found none but females; nor had those we caught any food in their stomachs. We saw also near this place abundance of aquatic birds, such as tropic birds, men of war, boobies, &c. On the N. E. side we found the remains of a wreck; she seemed to have been a vessel of one hundred and fifty tons burthen. We were informed, that there is a fine spring in a valley between two hills, on the top of the mountain above-mentioned; besides great quantities of fresh water in holes in the rocks. While the Resolution lay in the road, a sloop belonging to New-York anchored by her. She had been to the coast of Guinea with a cargo of goods, and came here under a pretence to take in turtle; but her real intention was, we believe, to traffic with the officers of our homeward bound East-Indiamen; for she had lain here near a week, and had got on board twenty turtle; whereas a sloop from Bermuda, had sailed but a few days before, with one hundred and five on board, which were as many as she could take in; but having turned several more on different beaches, they inhumanly ripped open their bellies, for the sake of the eggs, and left the carcases to putrify. The centre of this island of Ascension is situated in the latitude of 8 deg. S. and 14 deg. 28 min. 30 sec. W. longitude.

On Wednesday, the 31st of May, we departed from the island of Ascension, and steered, with a fine gale at S. E. by E. for that of Fernando de Noronha, on the coast of Brazil, in order to determine its longitude. In our passage for this place we had very good weather, and fine moon-light nights, which afforded us many opportunities of making lunar observations. On the 9th of June we made the island, which had the appearance of several detached hills; the largest of which very much resembled the steeple of a church. As we advanced, and drew near it, we found the sea broke in a violent surf on some sunken rocks, which lay about a league from the shore. We now hoisted English colours, and bore up round the north end of the isle, which is a group of little islets; for we perceived plainly, that the land was unconnected, and divided by narrow channels. On one of these, next the main, are several strong forts, rendered so by the nature of their situation, which is such as to command all the anchoring and landing-places about the island. We continued to sail round the northern point, till the sandy beaches, before which is the road for shipping, and the forts were open to the westward of the said point. As the Resolution advanced, a gun was fired, and immediately the Portuguese colours were displayed on all the forts; but not intending to stop here, we fired a gun to the leeward, and stood away to the northward, with a fresh breeze at E. S. E. The hill, which appears like a church tower, bore S. 27 deg. W. five miles distant; and from our present point of view it appeared to lean, or over-hang to the east. Fernando de Noronha is in no part more than six leagues in extent, and exhibits an unequal surface, well clothed with wood and herbage. Its latitude is 3 deg. 53 min. S. and its longitude carried on by the watch, from St. Helena, is 32 deg. 34 min. W. Don Antonio d'Ulloa, in his account of this island, says, "that it hath two harbours, capable of receiving ships of the greatest burden; one is on the north side, and the other on the N. W. The former is, in every respect, the principal, both for shelter and capaciousness, and the goodness of its bottom; but both are exposed to the north and west, though these winds, particularly the north, are periodical, and of no long continuance. You anchor in the north harbour (which Capt. Cook called a road) in thirteen fathoms water, one third of a league from the shore, bot-

tom of fine sand; the peaked hills bearing S. W. 3 deg. southerly." This road, or, (as Ulloa terms it) harbour, is very secure for shipping, being sheltered from the south and east winds. A mariner in our ship, had been aboard a Dutch East Indiaman, who, on account of her crew being sickly, and in want of refreshments, put into this isle. By him we were informed, that the Portuguese supplied them with some buffaloes; and that they got their water behind one of the beaches, from a small pool, scarcely big enough to dip a bucket in.

On Sunday, the 11th of June, at three o'clock P. M. in longitude 32 deg. 14 min. we crossed the line. We had equally weather from the E. S. E. with showers of rain, which continued, at times, till the 12th, and on the 13th the wind became variable. At noon we were in the latitude of 3 deg. 49 min. N. and in 31 deg. 47 min. W. longitude. We had now for most part of the day, dark, gloomy weather, till the evening of the 15th, at which time we were in latitude 5 deg. 47 min. N. and in 31 deg. W. longitude. After this we had three successive calm days, in which we had fair weather and rains alternately; and sometimes the sky was obscured by dense clouds, which broke in very heavy showers of rain. On Sunday, the 18th, we had a breeze at east, which fixed at N. E. and we stretched to N. W. As we advanced to the north, the gale increased. On Wednesday, the 21st, Capt. Cook ordered the still to be set to work, with a view of making the greatest quantity possible of fresh water. To try this experiment, the still was fitted to the largest copper we had, which held about sixty-four gallons of salt water. At four o'clock, A. M. the fire was lighted, and at six the still began to run. The operation was continued till six in the evening; at which time we had obtained thirty-two gallons of fresh water, and consumed one bushel and a half of coals. At noon, the mercury in the thermometer was eighty-four and a half, as high as it is generally found to rise at sea. Had it been lower more water would have been procured; for it is well known, that the colder the air is, the cooler the still may be kept, whereby the steam will be condensed faster. This invention, upon the whole, is a useful one, but it would not be prudent for a navigator to trust wholly to it; for though, with plenty of fuel, and good coppers, as much water may be obtained, as will be necessary to support life, yet the utmost efforts that can be employed in this work, will not procure a sufficiency to support health, especially in hot climates, where fresh water is most wanted; and in the opinion of Capt. Cook, founded on experience, the best judge of this matter, nothing can contribute more to the health of seamen than their having plenty of sweet fresh water.

On Sunday, the 25th, we were in latitude 16 deg. 12 min. N. and in 37 deg. 20 min. W. longitude. Observing a ship to windward, bearing down upon us, we shortened sail; but, on her approaching, we found by her colours she was Dutch; we therefore made sail again, and left her to pursue her course. On the 28th, we observed in the latitude of 21 deg. 21 min. N. longitude 40 deg. 6 min. W. and our course made good was N. by W. On the 30th, a ship passed us within hailing, but she was presently out of sight, and we judged her to be English. We were now in the latitude of 24 deg. 20 min. N. longitude 40 deg. 47 min. W. In latitude 29 deg. 30 min. we saw some sea-plants, commonly called gulph-weed, because it is supposed to come from the gulph of Florida; it may be so, and yet it certainly vegetates at sea. We continued to see this plant in small pieces, till in the latitude of 36 deg. N. beyond which parallel we saw no more of it. On Wednesday, the 5th of July, the wind veered to the east; and the next day it was a calm. On the 7th and 8th we had variable light airs; but on the 9th, the wind fixed at S. S. W. after which we had a fresh gale, and steered first N. E. and then E. N. E. our intention being to make some of the Azores, or Western Isles. On Tuesday the 11th, we were in latitude 36 deg. 45 min.

45 min. N. and in 36 deg. 45 min. W. longitude, when we descried a fail steering to the west; and on the 12th, we came in sight of three more.

On Thursday, the 13th, we made the isle of Fayal, and on the 14th, at day-break, we entered the bay of De Horta, and at eight o'clock anchored in twenty fathoms water, about half a mile from the shore. Our design in touching at this place, was to make observations, from whence might be determined with accuracy the longitude of the Azores. We were directed by the master of the port, who came on board before we cast anchor, to moor N. E. and S. W. in this station, the S. W. point of the bay-bore S. 16 deg. W. and the N. E. point, N. 33 deg. E. The church at the N. E. end of the town N. 38 degrees W. the west point of St. George's island N. 42 deg. E. distant eight leagues; and the isle of Pico extending from N. 74 deg. E. to S. 46 deg. E. distant five miles. In the bay we found the *Pourvoyeur*, a large French frigate, an American sloop, and a brig belonging to Fayal. On the 14th, the captain sent to the English consul, and notified our arrival to the governor, begging his permission to grant Mr. Wales an opportunity to make his observations on shore. This was readily granted, and Mr. Dent, who acted as consul, in the absence of Mr. Gathorne, not only procured this permission, but accommodated Mr. Wales with a convenient place in his garden, to set up his instruments; and in several other particulars, this gentleman discovered a friendly readiness to oblige us: even his house was always at our command, both night and day; and the entertainment we met with there was liberal and hospitable. All the time we staid at this place, the crew of our ship were supplied with plenty of fresh beef, and we purchased about fifty tons of water, at the rate of about three shillings per ton. To hire shore boats is the most general custom here, though ships are allowed, if they prefer many inconveniences to a trifling expence, to water with their own boats. Fresh provisions may be got, and hogs, sheep, and poultry, for sea-stock, at reasonable rates. The sheep are not only small, they are also very poor; but the bullocks and hogs are exceeding good. Here is plenty of wine to be had.

Before we proceed with our own observations, made during our abode at Fayal, it may be agreeable to our readers, to give them a brief account and description of all the Azores, or Western Islands. These have by different geographers, been variously deemed parts of America, Africa, and Europe, as they are almost in a central point: but we apprehend they may with more propriety be considered as belonging to the latter. They are a group of islands, situated in the Atlantic ocean, between twenty-five and thirty-two degrees of west longitude, and between thirty-seven and forty north latitude, nine hundred miles west of Portugal, and as many east of Newfoundland. They are nine in number, viz. St. Maria, St. Miguel, or St. Michael, Terceira, St. George, Graciosa, Fayal, Pico, Flores, and Corvo.

These islands were first discovered by some Flemish ships in 1439, and afterwards by the Portuguese in 1447, to whom they now belong. The two westernmost were named Flores and Corvo, from the abundance of flowers on the one, and crows on the other. They are all fertile, and subject to a governor-general, who resides at Angra in Terceira, which is also the seat of the bishop, whose diocese extends over all the Azores. The income of the latter, which is paid in wheat, amounts to about two hundred pounds sterling a year. On every island there is a deputy-governor, who directs the police, militia, and revenue; and a juiz, or judge, is at the head of the law department, from whom lies an appeal to a higher court at Terceira, and from thence to the supreme court at Lisbon. The natives of these islands are said to be very litigious.

St. Miguel, the largest, is one hundred miles in circumference, contains about twenty-nine thousand inhabitants, and is very fertile in wheat and flax. Its chief town is Ponta del Gado. This island was twice ravaged by the English in the time of queen Elizabeth.

Terceira, is reckoned the chief island, on account of its having the best harbour; and its chief town, named Angra, being the residence of the governor-general and the bishop. The town contains a cathedral, five other churches, eight convents, several courts of offices, &c. and is defended by two forts.

The island of Pico, so called from a mountain of vast height, produces excellent wine, cedar, and a valuable wood, called teixos. On the south of the island is the principal harbour, called Villa das Lagens.

The inhabitants of Flores having been many years ago infected with the venereal disease, by the crew of a Spanish man of war, that was wrecked upon their coast, the evil, it is said, still maintains its ground there, none of the inhabitants being free from it, as in Peru, and some parts of Siberia.

Travellers relate, that no poisonous or venomous animal is to be found in the Azores, and that if carried thither, it will expire in a few hours. One tenth of all their productions belong to the king, and the article of tobacco brings in a considerable sum. The wine, called Fayal wine, is chiefly raised in the island of Pico, which lies opposite to Fayal. From eighteen to twenty thousand pipes of that wine are made there yearly. All of these islands enjoy a salubrious air, but are exposed to violent earthquakes, from which they have frequently suffered.

Villa de Horta, the chief town in Fayal, like all the towns belonging to the Portuguese, is crowded with religious buildings; there being no 'els, in this little city, than three convents for men, and two for women. Here are also eight churches, including those belonging to the convents, and that in the Jesuits college. This college is a noble structure, and seated on an elevation, in the pleasantest part of the city. Since the expulsion of that order it has been suffered to go to decay, and, in a few years, by the all consuming hand of time, may be reduced to a heap of ruins. The principal produce of Fayal is wheat and Indian corn, with which the inhabitants supply Pico, which, in return, sends them wine, more than sufficient for their consumption, great quantities being annually shipped from De Horta, (for at Pico there is no road for shipping) for America, whence it has obtained the name of Fayal wine. The Villa de Horta is situated in the bottom of a bay, close to the edge of the sea. It is defended by two castles, one at each end of the town, and a stone work, extending along the sea-shore, from the one to the other. But these works serve more for show than defence; but it is a pity they should be suffered to run to decay; seeing they heighten greatly the prospect of the city, which is very beautiful from the road; but, setting aside the religious houses and churches, we saw not another edifice, that has any thing, either within or without, to recommend it. It is not the custom, in these parts, among the Portuguese or Spaniards, to have glass windows, but in this town the churches, and a country-house, lately belonging to the English consul, have their windows glazed: all others are latticed, which gave them in our eyes, the appearance of prisons. Before this Villa, at the east end of the island, is the bay or road of Fayal, which faces the west end of Pico. It is a semi-circle about two miles in diameter; and its depth, or semi-diameter, is three-fourths of a mile. The bottom is sandy, and the depth of water from six to twenty fathoms; but, near the shore, particularly at the S. W. head, the bottom is rocky; as it also is without the line that connects the two points of the bay; on which account it is not safe to anchor too far out. The bearings which we have laid down, when moored in this road, are sufficient to direct any steersman to the best ground. The winds to which this road lies most exposed are those that blow from between the S. S. W. and S. E. but as you can always get to sea with the latter, this is not so dangerous as the former; and we were told, there is a small cove round the S. W. point, called Porto Pierre, where small vessels are heaved down, and wherein a ship may lay tolerably safe. Upon the whole, we by no means think this road of Fayal a bad one. We were

were informed, by a Portuguese captain of the following particulars, which, if true, are not unworthy of notice. However, his account may be attended to by captains of ships, though not entirely relied on. This Portuguese told us, that in the direction of S. E. about half a league from the road, and in a line between that and the south side of Pico, lies a concealed sunken rock, covered with twenty-two fathom water, and on which the sea breaks from the south. He also gave us to understand, that of all the shoals about these isles that are laid down in our charts, and pilot books, only one has any existence, which lies between the islands of St. Mary and St. Michael, called Hormingan. He further informed us, that the distance between Fayal and the island of Flores, is forty-five leagues; and that there runs a strong tide between Fayal and Pico, the flood setting to the N. E. and the ebb to the S. W. but out at sea, the direction is E. and W. By various observations, the true longitude of this bay was found to be 28 deg. 39 min. 18 sec. and an half.

On Wednesday, the 19th, at four o'clock, A. M. we sailed out of the bay, and steered for the west end of St. George's island. Having passed this, we shaped our course E. half S. for the island of Terceira; and after a run of fourteen leagues, we found ourselves not more than one league from the west end. We now proceeded as expeditiously as the wind would permit, for England; and on Saturday, the 29th, we made the land near Plymouth. On the following day, the 30th, we cast anchor at Spithead, when Capt. Cook, in company with Messrs. Wales, Forsters, and Hodges, landed at Portsmouth, and from thence set out for London. The whole time of our absence from England was three years and eighteen days; and, owing to the unbounded goodness of an Almighty Preserver, who indulgently favoured our attempt, and seconded our endeavours, notwithstanding the various changes of climates (and they were as various as can be experienced) we lost only one man by sickness, and three by other causes. Even the single circumstance of keeping the ship's company in health, by means of the greatest care and attention, will make this voyage remarkable, in the opinion of every humane person; and we trust the grand end of this expedition, and the purposes for which we were sent into the southern hemisphere, were diligently and sufficiently pursued. The Resolution made the circuit of the southern ocean, in a high latitude, and Capt. Cook traversed it in such a manner, as to leave no room for a mere possibility of there being a continent, unless near the pole, and consequently out of the reach of navigation. However, by having twice explored the tropical sea, the situation of old discoveries were determined, and a number of new ones made; so that, we flatter ourselves, upon the whole, the intention of the voyage has, though not in every respect, yet upon the whole, been sufficiently answered; and by having explored so minutely the southern hemisphere, a final end may, perhaps, be put to searching after a continent, in that part of the globe, which has of late years, and, indeed, at times, for the two last centuries, engrossed the attention of some of the maritime powers, and been a favourite theory among geographers of all ages. The probability of there being a continent, or large track of land, near the Pole, has been already granted; and we may have seen part of it. The extreme cold, the numberless islands, and the vast floats of ice, give strength to this conjecture, and all tend to prove, that there must be main land to the south; but, that this must extend farthest to the north, opposite to the southern Atlantic and Indian oceans, we have already assigned several reasons; of which one is, the greater degree of cold in these seas than in the southern Pacific Ocean, under the same parallels of latitude; for in this last ocean, the mercury in the thermometer, seldom fell so low as the freezing point, till we were in latitude 60 deg. and upwards; whereas, in the other oceans, it fell as low in the latitude of 54 deg. the cause whereof we attributed to a greater quantity of ice, which extended farther north in the Atlantic and Indian oceans, than in the

south Pacific Sea; and supposing the ice to be first formed at, or near land, of which we are fully persuaded, it will be an undeniable consequence, that the land extends farther north. But what benefit can accrue from lands thus situated, should they be discovered? lands doomed to everlasting frigidness; and whose horrible and savage aspect no language or words can describe. Will any one venture farther in search after such a country, than our brave and skilful commander has done? Let him proceed, and may the God of universal nature be his guide! We heartily wish him success, nor will we envy him the honour of his discovery. In behalf of ourselves, the Editors who have the honour of submitting to the judgment of the public, this New, and Complete History of Captain Cook's Second Voyage, we must not say much, as by that judgment we stand or fall: thus much, however, we will venture to say, that this narrative is not defective in point of intelligence, that the facts are true, and that the whole is expressed in an easy style, which, we flatter ourselves will not be displeasing to our numerous friends, whose favours we here take the opportunity of gratefully acknowledging. It has been observed, that the principal officers of the Resolution delivered their journals into the custody of Captain Cook; and, on his arrival in England, Captain Furneaux also put into his hands a narrative of what happened in the Adventure after her final separation from the Resolution. But it is here necessary to remark further, that some officers, in both ships, reserved their private journals, and certain ingenious memorials, to gratify the curiosity of their friends. From such materials these sheets are composed; nor have we had recourse to any printed authorities, but from the sole view of correcting errors in some places, and rendering this undertaking, a full, comprehensive, and perfect work. This premised, we shall now lay before our readers, a complete narrative of Capt. Furneaux's proceedings in the Adventure; to which we shall subjoin the improvements that have been made, respecting the means of preserving the health of our seamen, and particularly those that were used by Capt. Cook in his voyages; and to these we shall add, a table of the language of the natives of the Society Isles, with an explanation of their meaning in English, &c. &c.

A new, accurate, concise, and complete Account of CAPT. FURNEAUX's proceedings in the ADVENTURE, from the time he was separated from the Resolution, to his arrival in England; wherein is comprised a faithful relation respecting the boat's crew, who were murdered, and eaten by the Cannibals of QUEEN CHARLOTTE'S SOUND in New ZEALAND.

IN October we made the coast of New A. D. 1773: Zealand, after a passage of fourteen days, from Amsterdam, and stood along shore till we reached Cape Turnagain, when a heavy storm blew us off the coast for three days successively, in which time we were separated from our consort, the Resolution, and saw her not afterwards, in the course of her voyage. On Thursday, the 4th of November, we regained the shore, near to Cape Palliser. Some of the natives brought us in their canoes abundance of cray-fish and fruit, which they exchanged for our Otaheite cloth, nails, &c. On the 5th, the storm again returned, and we were driven off the shore a second time by a violent gale of wind, accompanied with heavy falls of sleet, which lasted two days; so that by this time our decks began to leak, our beds and bedding were wet, which gave many of our people colds; and now we were most of us complaining, and all began to despair of ever getting into the sound, or, which we had most at heart, of joining the Resolution. We combated the storm till Saturday, the 6th, when, being to the north of the Cape, and having a hard gale from S. W. we bore away for some bay, in order to complete our wood and water, of both which articles we were at present

sent, in great want. For some days past we had been at the allowance of one quart of water, and it was thought six or seven days more would deprive us even of that scanty pittance. On Tuesday, the 9th, in latitude 38 deg. 21 min. S. and in 178 deg. 37 min. E. longitude, we came abreast of Tolaga bay, and in the forenoon anchored in eleven fathoms water, stiff, muddy ground, which lays across the bay for about two miles. This harbour is open from N. N. E. to E. S. E. nevertheless, it affords good riding with a westerly wind; and here are regular soundings from five to twelve fathoms. Wood and water are easily procured, except thorns. Wind and water are easily procured, except thorns. Wood and water are easily procured, except thorns. The natives about this bay are the same as those at Queen Charlotte's Sound, but more numerous, and have regular plantations of sweet potatoes, and other roots. They have plenty of fish of all sorts, which we purchased with nails, beads, and other trifles. In one of their canoes, we saw the head of a woman lying in state, adorned with feathers, and other ornaments. It had all the appearance of life, but, upon a nearer view we found it had been dried; yet, every feature was in due preservation and perfect. We judged it to have been the head of some deceased relative, kept as a relic. It was at an island in this bay, where the Endeavour's people observed the largest canoe they met with during their whole voyage. It was, according to account, no less than sixty-eight feet and a half long, five broad, and three feet six inches high: it had a sharp bottom, consisting of three trunks of trees hollowed, of which that in the middle was longest: the side planks were sixty-two feet long, in one piece, and were ornamented with carvings, not unlike fillagree work, in spirals of very curious workmanship, the extremities whereof were closed with a figure that formed the head of the vessel, in which were two monstrous eyes of mother of pearl, and a large shaped tongue; and, as it descended, it still retained the figure of a monster, with hands and feet carved upon it very neatly, and painted red. It had also a high peaked stern, wrought in fillagree, and adorned with feathers, from the top of which two long streamers depended, made of the same materials, which almost reached the water. From this description we might be tempted to suppose, these canoes to be the vessels, and this to be the country, lying to the south, of which Quiros received intelligence at Taumai; and where Toabia said they ate men, and had such large ships as he could not describe. On Friday, the 12th, having taken aboard ten tons of water, and some wood, we set sail for the Sound; but we were scarcely out when the wind began to blow dead hard on the shore, so that, not being able to clear the land, on either tack, we were obliged to return to the bay, where we arrived the next morning, the 13th; and, having anchored, we rode out a heavy gale of wind, at E. by S. attended with a very great sea. We now began to fear the weather had put it out of our power to join our consort, having reason to believe she was in Charlotte Sound, the appointed place of rendezvous, and by this time ready for sea. Part of the crew were now employed in stopping leaks, and repairing our rigging, which was in a most shattered condition.

On the 14th and 15th, we hoisted out our boats, and sent them to increase our stock of wood and water; but on the last day the surf rose so high, that they could not make the land. On Tuesday, the 16th, having made the ship as snug as possible, we unmoored at three o'clock, A. M. and before six got under way. From this time, to the twenty-eighth, we had nothing but tempestuous weather, in which our rigging was almost blown to pieces, and our men quite worn down with fatigue. On Monday, the 29th, our water being nearly expended, we were again reduced to the scanty allowance of a quart a man per diem. We continued beating backward and forward till the 30th, when the weather became more moderate; and having got a favourable wind, we were so happy at last as to gain with safety our desired port. After getting through Cook's Straits, we cast anchor at three o'clock, P. M. in

Queen Charlotte's Sound. We saw nothing of the Resolution, and began to doubt her safety; but, upon having landed, we discovered the place where she had pitched her tents; and, upon further examination, on an old stump of a tree, we read these words, cut out, "Look underneath." We complied instantly with these instructions, and, digging, soon found a bottle, corked and waxed down, wherein was a letter from Capt. Cook, informing us of their arrival at this place, on the third instant, and their departure on the 24th, and that they intended spending a few days in the entrance of the Straits, to look for us. We immediately set about the necessary repairs of the ship, with an intention of getting her to sea as soon as possible. On the 1st of December, the tents were carried on shore, the armourer's forge put up, and every preparation made for the recovery of the sick. The coopers were dispatched on shore, to mend the calks, and we began to unstow the hold to get at the bread; but, upon opening the calks we found a great quantity of it entirely spoiled, and most part so damaged, that we were obliged to bake it over again, which unavoidably delayed us some time. At intervals, during our stay here, the natives came on board as usual, with great familiarity. They generally brought fish, or whatever they had, to barter with us, and seemed to behave with great civility; though twice, in one night, they came to the tents, with an intention of stealing, but were discovered before they had accomplished their design. A party also came down in the night of the 13th, and robbed the astronomer's tent of every thing they could carry away. This they did so quietly, that they were not so much as heard, or suspected, till the astronomer getting up to make an observation, missed his instruments, and charged the centinel with the robbery. This brought on a pretty severe altercation, during which they spied an Indian creeping from the tent, at whom Mr. Bailey fired, and wounded him; nevertheless he made a shift to retreat into the woods. The report of the gun had alarmed his confederates, who, instead of putting off from the shore, fled into the woods, leaving their canoe, with most of the things that had been stolen, a-ground on the beach. This petty larceny, it is probable, laid the foundation of that dreadful catastrophe which soon after happened.

On Friday, the 17th, at which time we were preparing for our departure, we sent out our large cutter, manned with 7 seamen, under the command of Mr. John Rowe, the first mate, accompanied by Mr. Woodhouse, midshipman, and James Tobias Swilley, the carpenter's servant. They were to proceed up the Sound to Grays Cove, to gather greens and celery for the ship's company, with orders to return that evening; for the tents had been struck at two in the afternoon, and the ship made ready for sailing the next day. Night coming on, and no cutter appearing, the captain and others began to express great uneasiness. They sat up all night, in expectation of their arrival, but to no purpose. At day-break, therefore, the Captain ordered the launch to be hoisted out. She was double manned, and under the command of our second lieutenant, Mr. Burney, accompanied by Mr. Freeman, master, the corporal of marines, with five private men, all well armed, and having plenty of ammunition, two wall pieces, and three days provision. They were ordered first to look into East Bay, then to proceed to Grays Cove, and, if nothing was to be seen or heard of the cutter there, they were to go further up the Cove, and return by the west shore. Mr. Row having left the ship an hour before the time proposed for his departure, we thought his curiosity might have carried him into East Bay, none of our people having ever been there, or that some accident might have happened to the boat; for not the least suspicion was entertained of the natives, our boats having been higher up, and worse provided. Mr. Burney returned about eleven o'clock the same night, and gave us a pointed description of a most horrible scene indeed! the substance, and every material particular of whose report, are contained in the following relation, which includes the remarks of those who attended Mr. Burney,

On Saturday, the 18th, pursuant to our orders, we left the ship, about nine o'clock in the morning. Having a light breeze in our favour, we soon got round Long Island and Long Point. We continued sailing and rowing for East Bay, keeping close in shore, and examining with our glasses every cove on the larboard side, till near two o'clock in the afternoon, at which time we stopped at a beach on our left, going up East Bay, to dress our dinner. While we were cooking we saw an Indian on the opposite shore, running along a beach to the head of the bay; and when our meat was just done, we perceived a company of the natives, seemingly very busy; upon seeing which, we got immediately into the boat, put off, and rowed quickly to the place where the savages were assembled, which was at the head of this reach; and here, while approaching, we discerned one of their settlements. As we drew near some of the Indians came down upon the rocks, and waved for us to depart; but perceiving we disregarded them, they altered their gestures, and wild notes. At this place we observed six large canoes hauled upon the beach, most of them being double ones; but the number of people were in proportion neither to the size of these canoes, nor the number of houses. Our little company, consisting of the corporal, and his five marines, headed by Mr. Burney, now landed, leaving the boat's crew to guard it. Upon our approach the natives fled with great precipitation. We followed them closely to a little town, which we found deserted; but while we were employed in searching their huts, the natives returned, making a shew of resistance; but some trifling presents being made to their chiefs, they were very soon appeased. However, on our return to the boat, the savages again followed us, and some of them threw stones. As we came down to the beach, one of the Indians had brought a bundle of Hepatoos, or long spears, but seeing Mr. Burney looked very earnestly at him, he walked about with seeming unconcern. Some of his companions appearing to be terrified, a few trifles were given to each of them. From the place where we now landed, the bay seemed to run a full mile, N. N. W. where it ended in a long sandy beach. After dinner we took a view of the country near the coast, with our glasses, but saw not a canoe, or signs of inhabitants, after which we fired the wall-pieces, as signals to the cutter, if any of the people should happen to be within hearing. We now renewed our search along the east shore; and came to another settlement, where the Indians invited us ashore. We enquired of them about the cutter, but they pretended ignorance. They seemed very friendly, and sold us some fish.

At about five o'clock in the afternoon, and within an hour after we had left this place, we opened a small bay adjoining to Grays Cove, and here we saw a large double canoe, just hauled upon the beach, with two men and a dog. The two savages, on seeing us approach, instantly fled, which made us suspect, it was here we should have some tidings of the cutter. On landing, and examining the canoe, the first thing we saw therein was one of our cutter's rullock ports, and some shoes, one of which, among the latter, was known to belong to Mr. Woodhouse. A piece of flesh was found by one of our people, which at first was thought to be some of the salt meat belonging to the cutter's men, but, upon examination, we supposed it to be dog's flesh; a most horrid and undeniable proof soon cleared up our doubts, and convinced us we were among no other than cannibals; for, advancing further on the beach, we saw about twenty baskets tied up, and a dog eating a piece of broiled flesh, which, upon examining, we suspected to be human. We cut open the baskets, some of which were full of roasted flesh, and others of fern-root, which serves them for bread. Searching others, we found more shoes, and a hand, which was immediately known to have belonged to Thomas Hill, one of our fore-castle men, it having been tatowed with the initials of his name. We now proceeded a little way in the woods, but saw nothing else. Our next design was to launch the canoe, intending to destroy her;

but seeing a great smoke ascending over the nearest hill, we made all possible haste to be with them before sun-set.

At half after six we opened Grays Cove, where we saw one single, and three double canoes, and a great many natives assembled on the beach, who retreated to a small hill, within a ship's length of the water-side, where they stood talking to us. On the top of the high land, beyond the woods, was a large fire, from whence all the way down the hill, the place was thronged like a fair. When we entered the cove, a musketoon was fired at one of the canoes, as we imagined they might be full of men lying down; for they were all afloat, but no one was seen in them. Being doubtful whether their retreat proceeded from fear, or a desire to decoy us into an ambuscade, we were determined not to be surprised, and therefore running close in shore, we dropped the grappling near enough to reach them with our guns; but at too great a distance to be under any apprehensions from their treachery. The savages on the little hill, kept their ground, hallooing, and making signs for us to land. At these we now took aim, resolving to kill as many of them as our bullets would reach; yet it was some time before we could dislodge them. The first volley did not seem to affect them much; but, on the second, they began to scramble away as fast as they could, some howling and others limping. We continued to fire as long as we could see the least glimpse of any of them, through the bushes. Among these were two very robust men, who maintained their ground without moving an inch, till they found themselves forsaken by all their companions, and then, disdaining to run, they marched off, with great composure and deliberation. One of them, however, got a fall, and either lay there, or crawled away on his hands and feet; but the other escaped without any apparent hurt. Mr. Burney now improved their panic, and, supported by the marines, leapt on shore, and pursued the fugitives. We had not advanced far from the water-side, on the beach, before we met with two bunches of celery, which had been gathered by the cutter's crew. A broken oar was stuck upright in the ground, to which the natives had tied their canoes; whereby we were convinced this was the spot where the attack had been made. We now searched all along at the back of the beach, to see if the cutter was there, but, instead of her, the most horrible scene was presented to our view, that was ever beheld by any European; for here lay the hearts, heads, and lungs, of several of our people, with hands and limbs, in a mangled condition, some broiled, and some raw; but no other parts of their bodies, which made us suspect, that the cannibals had feasted upon, and devoured the rest. To complete this shocking view of carnage and barbarity, at a little distance we saw the dogs gnawing their entrails. We observed a large body of the natives collected together on a hill, about two miles off; but, as night drew on apace, we could not advance to such a distance; neither did we think it safe to attack them, or even to quit the shore, to take an account of the number killed, our troop being a very small one, and the savages were both numerous, fierce, and much irritated. While we remained almost stupified on the spot, Mr. Fannen said, that he heard the cannibals assembling in the woods; on which we returned to our boat, and, having hauled alongside the canoes, we demolished three of them. During this transaction, the fire on the top of the hill disappeared, and we could hear the savages in the woods at high words; quarrelling, perhaps, on account of their different opinions, whether they should attack us, and try to save their canoes. They were armed with long lances, and weapons, not unlike a serjeant's halbert in shape, made of hard wood, and mounted with bone instead of iron. We suspected, that the dead bodies of our people had been divided among those different parties of cannibals, who had been concerned in the massacre; and it was not improbable, that the group we saw at a distance by the fire, were feasting upon some of them, as those on shore had been, where the remains were found,

found, before they had been disturbed by our unexpected visit: be that as it may, we could discover no traces of more than four of our friends bodies, nor could we find the place where the cutter was concealed. It now grew dark, on which account, we collected carefully the remains of our mangled friends, and putting off, made the best of our way from this polluted place, not without a few execrations bestowed on the blood-thirsty inhabitants. When we opened the upper part of the Sound, we saw a very large fire about three or four miles higher up, which formed a complete oval, reaching from the top of a hill down almost to the water-side; the middle space being inclosed all round by the fire, like a hedge. Mr. Burney and Mr. Fannen having consulted together, they were both of opinion, that we could, by an attempt, reap no other advantage than the poor satisfaction of killing some more of the savages. Upon leaving Grays Cove, we had fired a volley towards where we heard the Indians talking; but by going in and out of the boat, our pieces had got wet, and four of them misfired. What rendered our situation more critical was, it began to rain, and our ammunition was more than half expended. We, for these reasons, without spending time where nothing could be hoped for but revenge, proceeded for the ship, and arrived safe aboard before midnight. Such is the account of this tragical event; the poor victims were far enough out of hearing, and in all probability every man of them must have been butchered on the spot.

It may be proper here to mention, that the whole number of men in the cutter were ten, namely, Mr. Row, our first mate, Mr. Woodhouse, a midshipman, Francis Murphy, quarter-master, James Sciville, the Captain's servant, John Lavenaugh, and Thomas Milton, belonging to the after-guard; William Facey, Thomas Hill, Michael Bell, and Edward Jones, fore-castle-men. Most of these were the stoutest and most healthy people in the ship, having been selected from our best seamen. Mr. Burney's party brought on board the head of the Captain's servant, with two hands, one belonging to Mr. Rowe, known by a hurt it had received; and the other to Thomas Hill, being marked with T. H. as before mentioned. These, with other mangled remains, were inclosed in a hammock, and with the usual ceremony observed on board ships, were committed to the sea. Not any of their arms were found; nor any of their cloaths, except six shoes, no two of which were fellows, a frock, and a pair of trowsers. We do not think this melancholy catastrophe was the effect of a premeditated plan, formed by the savages; for two canoes came down, and continued all the forenoon in Ship Cove, and these Mr. Rowe met, and bartered with the natives for some fish. We are rather inclined to believe, that the bloody transaction originated in a quarrel with some of the Indians, which was decided on the spot; or, our people rambling about too secure, and incautious, the fairness of the opportunity might tempt them to commit the bloody deed; and what might encourage them was, they had found out, that our guns were not infallible; they had seen them misfire; and they knew, that when discharged, they must be loaded before they could again do any execution, which interval of time they could take proper advantage of. From some circumstances we concluded, that after their success, there was a general meeting on the east side of the Sound. We knew the Indians of Shag Cove were there, by a long single canoe, which some of our people with Mr. Rowe had seen four days before in Shag Cove. After this shocking affair, we were detained four days in the Sound by contrary winds, in which time we saw none of the inhabitants. It is a little remarkable, that Captain Furneaux had been several times up Grays Cove with Capt. Cook, where they saw no inhabitants, and no other signs of any, but a few deserted villages, which appeared as if they had not been occupied for many years; and yet, in Mr. Burney's opinion, when he entered the same cove, there could not be less than fifteen hundred, or two thousand people. Had they been apprized of his coming, we doubt not they would have at-

tacked him; and seeing not a probability remained of any of our people being alive, from these considerations, we thought it would be imprudent to renew the search, and sent a boat up again.

On Thursday, the 23d of December, we departed from, and made sail out of the Sound, heartily vexed at the unavoidable delays we had experienced, so contrary to our sanguine wishes. We stood to the eastward, to clear the straits, which we happily effected the same evening, but we were baffled for two or three days with light winds before we could clear the coast. In this interval of time, the chests and effects of the ten men who had been murdered, were sold before the mast, according to an old sea custom. We now steered S. S. E. till we got into the latitude of 56 deg. S. At this time we had a great swell from the southward, the winds blew strong from S. W. the weather began to be very cold; the sea made a continual breach over the ship, which was low and deep laden, and by her continual straining, very few of our seamen were dry either on deck or in bed. In the latitude of 58 deg. S. and in 213 deg. E. longitude, we fell in with some ice, and standing to the east, saw every day more or less. We saw also the birds common in this vast ocean, our only companions, and at times we met with a whale or porpoise, a seal or two, and a few penguins.

On the 10th of January 1774, we arrived a-breast of Cape Horn, in the latitude of 61 deg. S. and in the run from Cape Palliser in New Zealand to this cape we were little more than a month, which is one hundred and twenty-one degrees of longitude in that short time. The winds were continually westerly, with a great sea. Having opened some casks of pease and flour, we found them very much damaged; for which reason we thought it most prudent to make for the Cape of Good Hope, intending first to get into the latitude and longitude of Cape Circumcision. When to the eastward of Cape Horn, we found the winds came more from the north, and not so strong and frequent from the westward, as usual, which brought on thick foggy weather; so that for several days together, we were not able to make an observation, the sun all the time not being visible. This weather lasted above a month, in which time we were among a great many islands of ice, which kept us constantly on the look out, for fear of running foul of them. Our people now began to complain of colds and pains in their limbs, on account of which we hauled to the northward, making the latitude of 54 deg. S. We then steered to the east, with an intention of finding the land laid down by M. Bouvet. As we advanced to the east, the nights began to be dark, and the islands of ice became more numerous and dangerous.

On the 3d of March, we were in the latitude of Bouvet's discovery, and half a league to eastward of it; but not perceiving the least sign of land, either now, or since we obtained this parallel, we gave over a further search after it, and hauled away to the northward. In our last track to the southward, we were within a few degrees of the longitude assigned for Bouvet's discovery, and about three degrees to the southward; if therefore there should be any land thereabout, it must be a very inconsiderable island; or, rather we are inclined to think, a mere deception from the ice; for, in our first setting out, we concluded we had made discoveries of land several times, which proved to be only high islands of ice, at the back of large fields, which M. Bouvet might easily mistake for land, especially as it was thick foggy weather.

On the 17th, in the latitude 48 deg. 30 min. S. and in 14 deg. 26 min. E. longitude, we saw two large islands of ice. On the 18th, we made the land of the Cape of Good Hope, and on the 19th, anchored in Table Bay. Here we found Commodore Sir Edward Hughes, with his majesty's ships Salisbury, and Sea Horse. We saluted the garrison with thirteen guns, and the commodore with an equal number; the latter returned the full complement, and the former, as usual, saluted us with two guns less. At this place Capt. Furneaux left a letter for Capt. Cook; and here we remained

mained to refit the ship, refresh the people, &c. &c. till the 16th of April, when we hoisted sail for England; and on the 14th of July, to the great joy of all our failors, anchored at Spithead.

From a review of the whole, our readers must see, how much this nation is indebted to that able circumnavigator Captain Cook. If they only compare the course the *Resolution* steered, and the valuable discoveries she made, with that pursued by the *Adventure*, after she parted company, the contrast will be sufficiently striking. How meritorious also must that person appear in our judgment, who hath not only discovered, but surveyed vast tracks of new coasts; who has dispelled the illusion of a terra australis incognita, and fixed the bounds of the habitable earth, as well as those of the navigable ocean, in the southern hemisphere. No proposition was ever more clearly demonstrated, that there is no continent undiscovered in the southern hemisphere, between the equator and the 50th deg. of southern latitude, in which space all who have contended for its existence have included, if not the whole, at least the most considerable part. But, at the same time that we declare ourselves thus clearly convinced of the non-existence of a continent within the limits just mentioned, we cannot help acknowledging our ready belief, that the land our navigators have discovered, to the S. E. of Staten Land, is part of a continent, projecting from the north, in a narrow neck, and expanding to the southward and westward, in like manner as the South American Continent takes its rise in the south, and enlarges as it advances northward, more particularly towards the east. In this belief we are strengthened by the strong representation of land seen at a distance by our navigators, in latitude 72 deg. and 252 deg. longitude, and by the report of Theodore Gerrards, who, after passing the straits of Magellan, being driven by tempests into the latitude of 64 deg. S. in that height came in sight of a mountainous country, covered with snow, looking like Norway, and seemingly extending from east to west. These facts, and the observations made by Capt. Cook, corroborate each other; and, though they do not reduce the question to an absolute certainty, yet the probability is greatly in favour of the supposed discovery. To conclude these reflections, and to place the character of our judicious navigator in the most striking point of view, we need only add, as proposed, an incontestable account of the means, by which, under the divine favour, Capt. Cook, with a company of 118 men, performed a voyage of three years and eighteen days, throughout all the climates, from 52 deg. N. to 71 deg. S. with the loss only of one man by sickness; and even this one began so early to complain of a cough, and other consumptive symptoms, which had never left him, that his lungs must have been affected before he came on board to go the voyage. Did any, most conversant in the bills of mortality, whether in the most healthful climate, and in the best condition of life, ever find so small a list of deaths, among such a number of men within that space? How agreeable then must our surprize be, to find, by the assiduity and unremitting exertions of a single skilful navigator, the air of the sea acquitted of all malignity, and that a voyage round the world has been undertaken with less danger, perhaps, to health, than a common tour in Europe! Surely distinguished merit is here conspicuous, though praise and glory belong to God only!

RULES for preserving the HEALTH of SEAMEN in long VOYAGES; and the MEANS employed by CAPT. COOK, to that End, during his VOYAGE ROUND the WORLD, in his MAJESTY'S SHIP the *RESOLUTION*.

Before we enter upon this subject, which hath for its object the saving the lives of men, it will be necessary to say something on that disorder to which seamen are peculiarly subject; and to consider, how many have perished by marine diseases, before any considerable

improvements were made in the means either of their prevention or cure. The sickness most destructive to mariners, and against the dreadful attacks of which preservatives have been contrived, is the scurvy. This is not that distemper erroneously so called, among landsmen; but belongs to a class of diseases totally different from it. So far is the common received opinion from being true, which asserts, "there are few constitutions altogether free from a scorbutic taint," that, unless among failors, and others, circumstanced like them, more particularly with respect to those who use a salt and putrid diet, and especially if they live in foul air and uncleanness, we are inclined to think there are few disorders less frequent. Nor do we believe, which is another vulgar notion, that the sea-air is the cause of the scurvy; since, on board a ship, cleanliness, ventilation, and fresh provisions would preserve from it, and upon the sea-coast, free from marshes, the inhabitants are not liable to that disorder, though frequently breathing the air from the sea. We should, for these reasons, rather ascribe the scurvy to other causes; and we believe it be a beginning corruption of the whole habit, similar to that of every animal substance when deprived of life. This has been verified by the symptoms in the scorbutic sick, and by the appearances in their bodies after death. With respect to the putrifying quality of sea-salt, we may remark, that salted meats, after some time, become in reality putrid, though they may continue long palatable, by means of the salt; and common salt, supposed to be one of the strongest preservatives from corruption, is, at best, but an indifferent one, even in a large quantity; and in a small one, so far from impeding putrefaction, it rather promotes that process in the body. Some are of opinion, that the scurvy is much owing to intense cold, which checks perspiration; and hence, say they, arises the endemic distemper of the northern nations, particularly of those around the Baltic. The fact is partly true; but we are doubtful about the cause. In these countries, by reason of long and severe winters, the cattle, being destitute of pasture, can barely live, and are therefore unfit for use; so that the people, for their provisions, during that season, are obliged to kill them by the end of autumn, and to salt them for above half the year.

This putrid diet then, on which they must so long subsist, seems to be the chief source from whence the disease originates. And if we consider, that the lowest class of people in the north, have few or no greens nor fruit, in winter, little or no fermented liquors, and often live in damp, foul, and ill-aired houses, it is easy to conceive, how they should become liable to the same disorder with seamen; whereas, others, who live in as high a latitude, but in a different manner, are free from it. Thus we are informed by Linnæus, that the Laplanders are unacquainted with the scurvy; for which no other reason can be assigned, than their never eating salted meats, nor indeed salt with any thing, but their using all the fresh flesh of their rein-deer. And this exemption of the hyperborean nations from the general distemper of the north, is the more remarkable, as they seldom taste vegetables, and bread never. Yet in the very provinces bordering on Lapland, where they use bread, but scarcely any vegetables, and eat salted meats, they are as much troubled with the scurvy as in any other country. But here we may properly observe, that the late improvements in agriculture, gardenings, and husbandry, by extending their salubrious influence to the remotest parts of Europe, and to the lowest class of people, begin sensibly to lessen the frequency of that complaint, even in those climates wherein it has been most brief and fatal. Again, it has been asserted, that those who live on shore, or landsmen, will be affected with the scurvy, though they may have never been confined to salt meats: but of this we have not met with any instances, except among such who have breathed a marshy air, or what was otherwise putrid; or among those who wanted exercise, fruits, and the common vegetables: under which particular circumstances we grant, that the humours will corrupt in the same manner,

ner, though not in the same degree, with those of seamen. In the war, when Sissinghurst Castle in Kent, was filled with French prisoners, the scurvy broke out among them, notwithstanding they had never been among them, notwithstanding they had never been served with salted victuals in England, but had daily an allowance of fresh meat, and bread in proportion, though without vegetables. And besides the want of this necessary supply of greens, the wards were crowded and foul, the house damp, by reason of a circumambient moat, and the bounds allotted for taking the air were so small, and in wet weather so swampish, that the men seldom were disposed to quit the house. A representation having been made of these deficiencies, in consequence thereof the prisoners were supplied with roots and greens for boiling in their broth, the sick were quartered out in a dry situation, where they had the liberty of air and exercise; and by these means they all quickly recovered. We think it probable that the scurvy sooner appeared among these strangers, from their having been taken at sea, and therefore, from their diet, they were more disposed to the disease. Such is the nature and cause of that sickness most destructive to sailors.

Let us now take a transient view of its dreadful ravages; and by a contrast between the old and present times, we shall see, more evidently, the importance and value of the means proposed, and which have been most successfully employed by Capt. Cook, for its prevention and cure. In the first voyage for the establishment of the East-India Company, a squadron was fitted out, and under the command of Lancaster (who was then styled general) in the year 1601. The equipment consisted of four ships, with four hundred and eighty men on board. Three of those vessels were so weakened by the scurvy, when they had got only three degrees beyond the equinoctial line, that the merchants, who had embarked on this adventure, were obliged to do duty as common sailors. At sea, on shore, and at Soldania, the then place of refreshment on this side the Cape of Good Hope, there died in all, nearly a fourth part of their complement, and that before they had proceeded half way to the place of their destination. Sir William Hawkins, who lived in that age, an intelligent and brave sea-officer, has left it upon record, "that in twenty years, during which he had used the sea, he could give an account of ten thousand mariners who had been consumed by the scurvy alone." If then in the very infancy of the naval power of England, so many were destroyed by that bane of seafaring men, what must have been the havoc made since that early date, while our fleet has been gradually increasing, new ports for commerce opening, and yet so little advancement made in the nautical part of medicine. And within our own remembrance, when it might have been expected, that whatever tended to aggrandize the naval power of Great Britain, and to extend her commerce, would have received the highest improvement: yet, even at these latter dates, we shall find few measures were adopted to preserve the health of seamen, more than had been known to our uninformed ancestors. The successful, but mournful expedition of Commodore Anson, afterwards an admiral, and lord, affords a melancholy proof of the truth of this assertion. After having passed the straits of La Maire, the scurvy began to rage violently in this little squadron; and by the time the Centurion had advanced but a little way into the South Sea, forty-seven sailors died of it in that ship; nor were there scarcely any on board, who had not, in some degree, been touched with the distemper, though they had not at that time been quite eight months from England. In the ninth month, when abreast of the island of Juan Fernandez, the Centurion lost double that number; and such an amazing swift progress did the mortality make in this single ship, that before they landed on that island she had buried 200 of her hands; not being able to muster any more in a watch, capable of doing duty, than two quarter masters, and six foremast men. This was the condition of one of the three ships which reached that island; and the other two

suffered in proportion. Nor did the destroyer stop here his cruel ravages, but, after a few months respite, renewed his attacks; for the same disease broke out afresh, making such havoc, that before the Centurion (in which were the whole surviving crews of the three ships) had reached the island of Tinian, there died sometimes eight or ten in a day, so that when they had been only two years on their voyage, they had lost a larger proportion than of four in five of their original number, and all of them after having entered the South Sea, of the scurvy: but we apprehend this was not strictly the case; but that the cause of so great a mortality was a pestilential kind of distemper, distinguished on land by the name of the jail, or hospital fever; and indeed, in the observations made by two of Commodore Anson's surgeons, it is affirmed, that the scurvy at that time was accompanied with putrid fevers: however, it is not material, whether the scurvy, or fever combined with it, were the cause of the destructive mortality in Lord Anson's fleet, since it must be acknowledged both arose from foul air, and other sources of putrefaction; and which may now, in a great measure, be obviated, by the various means fallen upon since the time of that expedition: and this naturally leads us, in due order, to take a view of the principal articles of provision, and other methods employed by that prudent as well as brave commander, Capt. Cook. We shall mention all such articles as were found the most useful; and in this list of preservative stores, shall begin with

1. Sweet Wort. This was distributed, from one to three pints a day, or in such a proportion as the surgeon judged necessary, not only to those men who had manifest symptoms of the scurvy, but to such also as were judged to be most liable to it. Beer hath always been esteemed one of the best antiscorbutics; but as that derived all its fixed air from the malt of which it was made, this was thought to be preferable in long voyages, as it would take up less room than the beer, and keep longer sound. Experience has since verified the theory; and in the medical journal of Mr. Patten, surgeon to the Resolution, we find the following passage, which fully corroborates the testimony of Capt. Cook and others, in favour of Sweet Wort, as being the best antiscorbutic medicine yet known. "I have found (observes this gentleman) the wort of the utmost service in all scorbutic cases during the voyage. As many took it by way of prevention, few cases occurred where it had a fair trial; but these, however, I flatter myself, will be sufficient to convince every impartial person, it is the best remedy hitherto found out for the cure of the sea scurvy; and I am well convinced, from what I have seen the wort perform, and from its mode of operation, that if aided by portable soup, four-kroust, sugar, fago, and currants, the scurvy, that maritime pestilence, will seldom, or never make its appearance among a ship's crew, on the longest voyages; proper care with regard to cleanliness and provisions being observed." It hath been constantly observed by our sea-surgeons, that in long cruizes, or distant voyages, the scurvy never makes its alarming appearance, so long as the men have their full allowance of small beer; but that when it is all expended, the disorder soon prevails: it were therefore to be wished, that our ships would afford sufficient room for this wholesome beverage. But, we are informed, the Russians both on board, as well as on land, make the following middle quality between wort and small beer. They take ground malt and rye meal in a certain proportion, which they knead into small loaves, and bake in the oven. These they infuse occasionally in a proper quantity of warm water, which begins so soon to ferment, that in the space of 24 hours, their brewage is completed, and a small, brisk, acetous liquor produced, to which they have given the name of quas. Dr. Mounsey, who lived long in Russia, in writing to his friends in England, observes, that the quas is the common and salutary drink both of the fleets and armies of that empire, and that it was peculiarly good. The same gentleman having visited the several prisons in the city of Moscow, was surprized to find it full of

malefactors, but more so when he could discover no fever among them, nor learn that any acute distemper, peculiar to jails, had ever been known there. He observed, that some of those places for confinement had a yard, for the use of the prisoners, but in others without that advantage, they were not sickly: so that he could assign no other reason for the healthful condition of those men, than their kind of diet, which was the same with that of the common people of the country, who live mostly on rye-bread (a strong acceſcent) and drink quas. Upon his return to St. Petersburg, he had made the same enquiry there, and with the same result. From this account it should seem, that the rye-meal both quickens the fermentation, and adds more fixed air, since the malt alone could not so readily produce such a tart, brisk liquor. And there is little doubt, but that whenever the other grains can be brought to a proper degree of fermentation, they will more or less in the same way become useful. That oats will, we are convinced from an experiment made by Capt. Cook. When on a cruize in the *Essex*, a 74 gun ship, and the scurvy breaking out among his crew, he recollected a kind of food most proper on that occasion, which he had seen used in some parts of the north, called *Sooins*. This is made by putting some oat-meal into a wooden vessel; then pouring hot water upon it, let the infusion continue until the liquor begins to taste sourish, that is, till a fermentation comes on, which, in a place moderately warm, may be produced in about two days. The water must then be poured off from the grounds, and boiled down to the consistence of a jelly. This the Captain ordered to be made and dealt out in messes, being first sweetened with sugar, and seasoned with some prize French wine, which, though turned sour, improved the taste. This diet chiefly, not less palatable than medicinal, and by abstaining from salt meats, quite recovered his scorbutic sick, not only in this, but in subsequent cruizes, without his being obliged to send one of them on shore because they could not recover at sea. Before the power of the fixed air in subduing putrefaction was known, the efficacy of fruits, greens, and fermented liquors was commonly ascribed to the acid in their composition; and we have still reason to believe, that the acid concurs in operating that effect. In case of a scarcity in these articles, or a deficiency of malt, or when the grain should be spoiled, other substitutes may be found very serviceable; as distilled water, acidulated with the spirit of sea salt, in the proportion of only ten drops to a quart; or with the weak spirit of vitriol, thirteen drops to the same measure, which may be given to those who are threatened with the scurvy, at least three quarts of this liquor daily, to be drank with discretion, as they shall think proper. The fixed air abounds in wine, and perhaps no vegetable substance is more replete with it than the juice of the grape. If we join the grateful taste of wine, we must rank it the first in the list of antiscorbutic liquors. Cyder is also excellent, with other vinous productions of fruit; indeed this salutary fixed air is contained more or less in all fermentable liquors, and begins to oppose putrefaction as soon as the working, or intestine motion commences.

II. The next article of extensive use, was *Sour-kROUT*, (four cabbage) a food of universal repute in Germany. Its spontaneous fermentation produces that acidity which makes it agreeable to the taste of all who eat it. The Resolution had a large quantity of this wholesome vegetable food on board, and it spoils not by keeping: in the judgment of Capt. Cook, *sour-kROUT* is highly antiscorbutic. The allowance for each man, when at sea, was a pound, served twice a week, or oftener, as was thought necessary. Some of the distinguished medical writers of our times, have disapproved of the use of cabbage as an anti-scorbutic; notwithstanding the high encomiums bestowed upon it by the ancients, (witness what Cato the elder, and Pliny the naturalist, say on the subject,) and although it hath had the sanction of the experience of nations, for many past ages;

and by experiments laid before the Royal Society, by some of our most eminent physicians, it has been demonstrated, that this vegetable, with the rest of the supposed *alcalescents*, are really *acceſcents*; and that the scurvy is never owing to acidity, but to a species of putrefaction; that very cause of which the ill-grounded class of *alcalescents* was supposed to be a promoter.

III. Portable Soup was another article with which the Resolution was plentifully supplied. An ounce to each man, or such other quantity as circumstances pointed out, was boiled in their pease daily, three days in every week; and when vegetables were to be had it was boiled with them. Of this were made several nourishing messes, which occasioned the crew to eat a greater quantity of vegetables than they would otherwise have done. This broth being freed from all fat, and having by long boiling evaporated the most putrescent parts of the meat, is reduced to the consistence of a glue, which in effect it is, and will, like other glues, in a dry place, keep sound for many years.

IV. The Rob of Oranges and Lemons, which the surgeon made use of in many cases, with great success. Capt. Cook, it has been observed, did not much rely on these acids as a preservative against the scurvy; for which the following reason has been assigned by one of our most eminent physical professors. These preparations being only sent out upon trial, the surgeon of the ship was told how much he might give for a dose, without strictly limiting the quantum. The experiment was made with the quantity specified, but with so little success, that judging it not prudent to lose more time, he set about the cure with the wort alone, of the efficacy of which he was fully convinced; while he reserved the robs for other purposes; more particularly for colds, when to a large draught of warm water, with some spirits and sugar, he added a spoonful of one of them, and with these ingredients made a grateful sudorific that answered his intention. To which we may add, as worthy of notice, that as they had been reduced to a small proportion of their bulk by evaporation, it is probable they were much weakened, and that with their aqueous particles they had, by the fire, lost not a little of their aerial. If therefore a further trial of these juices were to be made, they should be sent to sea purified and entire in casks, agreeable to a proposal sent into the Admiralty some years ago, by an experienced surgeon of the navy. Upon the whole, the testimonies in favour of the salutary qualities of these acids are so numerous, and so strong, that we should look upon some failures, even in cases where their want of success cannot so well be accounted for as in this voyage, not a sufficient reason for striking them out of this list of preservatives against the consuming malady to which seamen are particularly subject. Nor must we omit observing under this head, that Capt. Cook says not more in praise of vinegar than of the robs, as appears from an extract of a letter, which he wrote to the president of the Royal Society, dated Plymouth Sound, July 7th, 1776. "I entirely agree with you, (says the Captain) that the dearth of the Rob of Lemons, and of Oranges, will hinder them from being purchased in large quantities; but I do not think these so necessary; for though they may assist other things, I have no great opinion of them alone. Nor have I a higher opinion of vinegar. My people had it very sparingly during the late voyage; and towards the latter part, none at all; and yet we experienced no ill effects from the want of it. The custom of washing the inside of the ship with vinegar I seldom observed, thinking fire and smoke answered the purpose much better." We will not controvert the position here laid down by Capt. Cook, nor would we infer from hence, that he thought vinegar of little service to a ship's company, but only that as he happened in this voyage to be sparingly provided with it, and yet did well, he could not therefore consider a large store of vinegar to be so material an article of provisions, as was commonly imagined: but notwithstanding the Captain supplied its place with *sour kROUT*, and trusted chiefly to
fire

fire for purifying his decks, yet it is to be hoped future navigators will not wholly omit such a refreshing and useful article. It is at least a wholesome variety in seasoning, very proper for cleansing the receptacles of the sick, and may be used at times, successfully as a medicine. The physician himself will sinell to vinegar to prevent infection from contagious diseases, and the sinell is certainly agreeable to the sick, especially to such who may be confined to a foul and crowded ward. Thus much for the salutary articles that have of late been added to the naval stores of all the king's ships on long voyages, which Capt. Cook ordered to be dispensed, as occasion might require, in a bountiful manner; to which he added the following regulations, either wholly new, or hints from Sir Hugh Palliser, Captains Campbell, Wallis, and other experienced friends; and as from these he formed a plan to which all his ship's company were to conform, he made them his own, and we may therefore justly place the merit to our skilful commander's account.

V. Captain Cook put his crew at three watches, instead of two; that is, he formed his whole crew into three divisions, each of which was ordered upon the watch by the boatwain four hours at a time; so that every man had eight hours free, for four of duty: whereas at watch and watch, the half of the men being on duty at once, with returns of it every four hours, they can have but broken sleep, and when exposed to wet, they cannot have time to get dry before the whistle calls them up, or they may lie down to rest themselves. When service requires, hardships must be endured, and no men in the world encounter them so readily, and with such alacrity, as our thorough bred English seamen do; nevertheless, when there is no pressing call, ought not our brave, hardy mariners to be indulged with as much uninterrupted rest as our common labourers? Indeed it is the practice of all good officers to expose their men as little to wet weather as possible; and we doubt not but they will pay attention to what was made an essential point with our humane commander. In the torrid zone he shaded his people from the scorching rays of the sun by an awning over his deck; and in his course under the southern polar circle, he provided for each man what the sailors called their Maghellan jacket, made of a substantial woollen stuff, with the addition of a hood for covering their heads; and this garb they found most comfortable for working in rain and snow, and among the loose ice in high southern latitudes. If Rome decreed a civic crown to him who saved the life of a single citizen, what honorary rewards, what praises are due to that hero, who contrived, and employed, such new means to save many; means, whereby Britannia will no more lament, on the return of her ships from distant voyages, the loss of her bold sons, her intrepid mariners, who by braving every danger, have so liberally contributed to the prosperity, opulence, and glory of her maritime empire!

VI. Unremitted care was taken to guard against putrefaction, and a variety of measures pursued, in order to procure, and maintain, a purity of air in the ship. To this end, some wood, and that not sparingly, being put into a proper stove, was lighted, and carried successively to every part below deck. Wherever fire is, the air nearest to it, being heated, becomes specifically lighter, and by being lighter rises, and passes through the hatchways into the atmosphere. The partial vacuum is filled with the cold air around, and that being heated in its turn, in like manner ascends, and is replaced with other air as before. Thus by continuing the fire for some time, in any of the lower apartments, the foul air is in a good measure driven out, and the fresh admitted. Besides, the acid steams of the wood, in burning, act probably here as an antiseptic, and correct the corrupted air that remains. The ship was generally thus aired with fires once or twice a week. It has been observed by an officer of distinguished rank, that all the old twenty gun ships were remarkably less sickly than those equal in dimensions, but of modern construction; which circumstance he could no other-

wife account for, than by the former having their fireplace or kitchen in the fore part of the deck immediately above the hold, where the flue vented so ill, that, when the wind was a-stern, every part was filled with smoke. This was a nuisance for the time, but which was abundantly compensated by the good health of the several crews: for those fire places dried the lower decks, much more when placed below, than they can now under the fore-castle upon the upper deck. But the most beneficial end answered by these portable stoves was, their drying up the damp, and foul moisture, especially in those places where the air was most likely to be corrupted for the want of a free circulation. This foul moisture is formed of the breath, and perspirable matter of a multitude of men, of the animals, or live stock, and of the steams of the bilge water from the well, where the stagnated corruption is the greatest. This putrid humidity, being one of the principal sources of the scorbutic disease, was, in order to its removal, particularly attended to; and while the fires were burning, some of the hands were employed in rubbing hard, with canvass, or oakum, every part of the ship that was damp and accessible. But the advantage of these means, for preserving the health of mariners, appeared no where so conspicuous, as in purifying the well; which being situated in the lowest part of the hold, the whole leakage runs into it, whether of the ship itself, or the casks of spoiled meat, or corrupted water. Yet this place was rendered both safe and sweet by means of an iron pot filled with fire, and let down to burn therein: we say safe, because the noxious vapours, from this sink alone, have often been the cause of instantaneous death to those who have unwarily approached to clean it; and not to one only, but to several successively, when they have gone down to succour their unfortunate assistants. When this wholesome process could not take place, by reason of stormy weather, the ship was fumigated with gunpowder, mixed with vinegar or water. The smoke could have little effect in drying, but it might correct the putrid air, by means of the acid spirits from the sulphur and nitre, assisted perhaps by the aerial fluid, then disengaged from the fuel, to counteract putrefaction. These purifications by gunpowder, by burning tar, and other resinous substances, are sufficiently known. We wish the same could be said of the ventilator, invented by Dr. Hales, the credit of which, though we are convinced of its excellence, is far from being established in the navy. Perhaps Capt. Cook had not time to examine it, and therefore would not encumber his ship with a machine he had possibly never seen worked, and of which, he had, at best, received but a doubtful character; and we find he was not altogether unprovided with an apparatus for ventilation. He had the windsails, which he found very serviceable, particularly between the tropics. They take up little room, require no labour in working, and the invention is so simple, that they can fail in no hands; but, yet their powers are small in comparison with those of Hales's ventilator; add to which, they cannot be put up in hard gales of wind, and they are of no use in dead calms, when a circulation of air is chiefly necessary, and required.

VII. The attention of Capt. Cook was directed not only to the ship, but to the persons, hammocks, bedding, cloaths, &c. of the crew, and even to the utensils they used, that the whole might be constantly kept clean and dry. Proper attention was paid to the ship's coppers; and the fat which boiled out of the salt beef and pork, the Captain never suffered to be given to the people, being of opinion that it promotes the scurvy. Cleanliness is not only conducive to health, it also tends to regularity, and is the patron of other virtues. If you can persuade those who are to be under command, to be more cleanly than they are disposed to be of themselves, they will become more sober, more orderly, and more attentive to their duty. The practice in the army verifies this observation; yet, we confess, a mariner has indifferent means to keep himself clean, had he the inclination to do it; but, in our opinion, sea officers

officers might avail themselves of the still for providing fresh water for the purpose of washing; seeing it is well known that salt water will not mix with soap, and linen wet with brine seldom thoroughly dries. As for Capt. Cook, one morning, in every week, he passed his ship's company in review, and saw that every man had changed his linen, and was in other points as clean as circumstances would permit; and the frequent opportunities he had of taking in fresh water among the islands in the South Sea, enabled him to allow his crew a sufficient quantity of this wholesome article for every use; and this brings us to another useful means conducive to the health of seamen.

VIII. Capt. Cook thought fresh water from the shore preferable to that which has been kept some time on board a ship, and therefore he was careful to procure a supply of this essential article wherever it was to be obtained, even though his company were not in want of it: nor were they ever at an allowance, but had always sufficient for every necessary purpose. Nor was the Captain without an apparatus for distilling fresh water; but though he availed himself sometimes of the invention, he did not rely on it, finding by experiments, that he could not obtain by this means nearly so much as was expected. This was no disappointment to him, since within the southern tropic, in the Pacific Ocean, he discovered so many islands, all well stored with wholesome springs; and when in the high latitudes, far from a single fountain, he found the hardships and dangers inseparable from the frigid zone, in some degree compensated by the singular felicity he enjoyed, of extracting inexhaustible supplies of fresh water from an ocean strewn with ice. Those very shoals, fields, and floating mountains of ice, among which he steered his perilous course, and which presented such terrifying objects of destruction, were the very means of his support, by supplying him abundantly with what he most wanted. That all frozen water would thaw into fresh, was a paradox that had been asserted, but met with little credit: even Capt. Cook himself expected no such transmutation; and therefore was agreeably surprised to find he had one difficulty less to encounter, namely, that of preserving the health of his men so long on salt and putrid provisions, with a scanty allowance of, perhaps, foul water, or only what he could obtain by the use of the still. An ancient writer of great authority, no less than one of the Pliny's, had assigned, from theory, bad qualities to melted snow; but our judicious commander affirms, that melted ice of the sea is not only fresh, but soft, and so wholesome, as to shew the fallacy of human reason unsupported by experiments. And what is very remarkable, though in the midst of flocks, falls of snow, thick fogs, and much moist weather, the Resolution enjoyed nearly the same state of health, she had experienced in the temperate and torrid zones. Indeed towards the end of the several courses, some of the mariners began to complain of the scurvy, but this disease made little progress; nor were other disorders, as colds, diarrhoeas, intermittents, and continued fevers, either numerous, alarming, or fatal. Nor must we omit here the remark of a celebrated physician, who justly observes, "that much commendation is due to the attention and abilities of Mr. Patten, the surgeon of the Resolution, for having so well seconded his Captain in the discharge of his duty. For it must be allowed, that in despite of the best regulations, and the best provisions, there will always be among a numerous crew, during a long voyage, some casualties more or less productive of sickness, and unless there be an intelligent medical assistant on board, many, under the wisest commander, will perish, that otherwise might have been saved. We shall observe once more,

IX. That Capt. Cook was not only careful to replenish, whenever opportunity permitted, his casks with water; but he provided his men with all kinds of refreshments, both animal and vegetable, that he could meet with, and by every means in his power: these, even if not pleasing to the palate, he obliged his peo-

ple to use, both by example, and authority; but the benefits arising from refreshments of any kind soon became so obvious, that he had little occasion to recommend the one, or exert the other. Thus did this expert and humane navigator employ all the means and regulations, which the art of man suggested, or the God of nature provided for the most benevolent purpose, even that of preserving the health and lives of those intrusted to his care. Here is greater merit than a discovery of frozen unknown countries could have claimed; and which will exist, in the opinion of every benevolent mind, a subject of admiration and praise, when the disputes about a southern continent, shall no longer engage the attention, or divide the judgment of philosophical enquirers. This is a memorial more lasting than the mimic bust, or the emblazoned medal; for this can never perish, but will remain engraven on the hearts of Englishmen to their latest posterity. May future navigators spring out of this bright example, not only to perpetuate his justly acquired fame, but to imitate his labours for the advancement of natural knowledge, the good of society, and the true glory of Great Britain.

A TABLE of the LANGUAGE, used by the NATIVES of the SOCIETY ISLES, in GRAMMATICAL ORDER; to which is affixed an EXPLANATION of their MEANING in ENGLISH.

NOUNS.	
Warradée	Anger
Momoa	An Ankle
Maa	Aliment
Tacree	Asium
Fefe	Abscess

Poupouee	Yes
Teero to	Yesterday
Ay, ai	Yes
Ninnahay	Yesterday
Erepe	Yesterday

PHRASES AND SENTENCES.

Tarappe,	To beckon a person with the hand.
Taata horoaocce,	You are a generous man.
Heamanee,	Boy—a familiar way of speaking.
Atceca,	Have done. It is enough. Or there is no more.
Farcewai,	To hide the face, as when ashamed.
Ehoa,	Friend—(a way of addressing a stranger.)
Eapatte,	A salutation to a particular friend.
Atoobianoo,	Hammer it out.
Mamoo,	Hold your tongue, be silent or quiet.
Tchanooce,	How do you do, or how is it with you?
Vaiheco,	Keep it to yourself.

Ahoaa,	My legs ache, or are tired.
Eoma te tarcca,	To prick up the ears.
Harrencina,	To walk quickly.
Enara,	Shew it me:
Hoina,	Smell it.
Neeate ootoo te parou no nona,	He speaks not from his heart, his words are only on his lips:
Atcearenona,	Stand up:
Areca, Arecana,	Stay, or wait a little.
Taurcaa,	Shall I throw it.
Popocunoo,	A little time, a small space.
Tamoo,	A long time, a great while.
Arecana,	Wait, stay a little.
Woura, wooara,	Well recovered, or well escaped.
Poorotoo,	It is well, charming fine.
Ehara, Eharya, Yehacea,	What's that? (inquisitively)
Owy te accoa,	What do you call that? What is the name of it?
Wheea,	When? at what time?
Tehca,	Where is it?
Owy, tanna, Owy nana,	Who is that? what is he called?
Accoo,	Will I not do it? (expressed angrily)
Terra, tanne,	She is a married woman, she has got another husband.

EXPLANATION of the foregoing and following TABLES, so far as respects the pronunciation of the words.

Whatever rules may be laid down for pronouncing a living language, they can be of little service to a person desirous of speaking the same with purity: that pronunciation being best, if not only attained, by living in the country, and a friendly communication with the natives. However, for the better understanding the language in these tables, we shall make a few observations on the powers of the vowels, viz.

A. is sounded the same as A long in the English tongue, as in the word *angel*; e has three powers, and has the same simple sounds as in the words *eloquence*, *bred*, *then*.

I. in the middle of words, sounds like that vowel in the word *indolence*. Sometimes it is represented by y. And sometimes by the proper diphthong *ie*.

O. is often expressed by oo, and sounds the same as in the word *good*.

U. is generally expressed by eu, and has a long and short sound, as in the words *unity*, *unlodge*.

T. in the middle or end of words, sounds like i, as *by*, *my*. But before a vowel or at the beginning of a word, it is a consonant, as in the English words *yes*, *yell*.

The diphthongs *ee* and *oo* are proper, and make but one simple sound.

LIST of the BARK ENDEAVOUR'S OFFICERS and PASSENGERS in Capt. COOK'S FIRST VOYAGE round the WORLD.

OFFICERS, &c.	NAMES.	Their subsequent Fortunes, or what became of them.
COMMANDER,	Capt. James Cook,	Killed on his third voyage, then a Post-captain.
	2d. Lieutenant Zachariah Hicks,	Died homeward bound, after leaving St. Helena.
	* 3d. Lieutenant John Gore,	Now a Post-captain in Greenwich-hospital.
MASTER,	Robert Molineux,	Died homeward bound, after leaving the Cape of Good Hope.
BOATSWAIN,	John Gaheray,	Died of a flux shortly after leaving Batavia.
CARPENTER,	William Satterly,	Ditto.
COOK,	John Thomson,	Ditto.
GUNNER,	Stephen Forwood,	Now or lately gunner of the Achilles of 64 guns.
SURGEON,	William Brougham Monkhouse,	Died ashore at Batavia.
MASTER'S MATE,	Charles Clerke,	Died on the fourth voyage, a master and commander.
Ditto,	Richard Pickersgill,	A lieutenant of the royal navy, drowned by accident in the Thames.
Ditto,	Alexander Weir,	Drowned outward bound at Madeira.
MIDSHIPMAN,	John William Bootie,	Died of a flux after leaving Batavia.
Ditto,	Jonathan Monkhouse,	Ditto.
Ditto,	Patrick Saunders,	Left the ship at Batavia, and died there soon after.
Ditto,	James Magra, alias James Maria Matra,	Since consul of the Canary Islands.
Ditto,	Francis Wilkinson,	Died at Deptford soon after his return.
Ditto,	Isaac George Manley,	A lieutenant of the royal navy.
SURGEON'S MATE,	William Perry,	Navy surgeon, lost on Scilly in the Nancy Packet from India.
CAPTAIN'S CLERK,	Richard Orton,	A purser of the royal navy.
SHIP'S OR PURSER'S		
STEWARD,	William Dawson,	Ditto.
SERGEANT OF MARINES,	John Edgcumbe,	Now a captain.

PASSENGERS.

	Joseph Banks, Esq;	The present president of the Royal Society, now Sir Joseph.
	Dr. Daniel Solander,	Died lately in London.
DRAUGHTSMEN of		
MR. BANKS,	Herman Diedrich Sporeing,	A Sweede, died of a flux after leaving Batavia.
	Sydney Parkinson,	A Quaker, ditto.
	Buchan,	Died after a short illness at Otaheite of fatigue.
ASTRONOMER,	Charles Green,	Died of an inverted gout, after leaving Batavia.

* Capt. Gore has completed four Voyages round the World, besides serving long in the former war on board the Windsor &c. &c.

* * Having prepared a complete narrative (from duplicates of the original journals of several officers, who failed in the *Resolution* when she was destined to explore the *Pacific Ocean*) of Capt. COOK'S THIRD VOYAGE, the Editors of this complete COLLECTION of VOYAGES ROUND THE WORLD, thought it their duty to compare it with all the different accounts hitherto published of that celebrated voyage, merely to correct any circumstance which might have been placed in various points of view by the several writers. The different relations of this Voyage as already given to the public by Evans, Newbery, Moore, Ellis, Jones, King, &c. &c. together with those published in all the Magazines and Newspapers, as well as those said to be published by and dedicated to the Lords of the Admiralty, have been carefully consulted, and have not only been found to contradict each other very materially, but also to vary in some important points from the manuscripts and materials which have furnished our own account. — We think it necessary therefore to bestow some time, and considerable pains, to investigate the inconsistencies here alluded to, in order that we may be enabled to present to our very numerous subscribers (in the course of this work) what we pledged ourselves to do in our Proposals, viz. to give a new, authentic, full, and complete Account of COOK'S LAST VOYAGE to the *Pacific Ocean*, and which will contain all the facts, incidents, and circumstances, related in a satisfactory

manner. In the mean time, nothing shall be wanting to render this work absolutely the best extent; all the large splendid copper-plates, maps, charts, &c. will be delivered as they are received from the several engravers, which will be directed to be placed right in the last Number; and the grand general Chart of the World will certainly be given in our next number, which will shew Capt. COOK'S different routs in his three successive voyages, and all his discoveries in one point of view. In the week after next will be delivered to the Subscribers a large folio print, finely engraved, representing the death of Capt. COOK. We shall now proceed to give a new and accurate Account of Commodore BYRON'S VOYAGE round the World, as it was the first undertaken and performed during the present reign; after which we intend to record those of WALLIS, CARTERET, &c. and the public may depend, that the only reason we have not given COOK'S Third Voyage in this part of our COLLECTION, is, that we may be able to give a more full and satisfactory account of this celebrated voyage, than has ever been published by any person or persons whatever; and after having performed our arduous task, we doubt not, but our Subscribers, and the Public, will readily acknowledge, that by our care and circumspection, we shall have detected numerous falsties which have been foisted on the public, and represented facts and circumstances as they really happened.

NEW, AUTHENTIC, and COMPLETE ACCOUNT and NARRATIVE, of
A VOYAGE Round the WORLD,

UNDERTAKEN and PERFORMED

By the Hon. Commodore (now Admiral) **BYRON,**

In his Majesty's Ship the **DOLPHIN**, accompanied by
 Capt. **MOUAT** in the **TAMAR** Sloop.

UNDERTAKEN PRINCIPALLY

For making Discoveries in the SOUTHERN OCEAN, between the Cape of Good Hope,
 and the MAGELLANIC STRAITS;

And Containing, among a Variety of other interesting Particulars,

A genuine Account of the Straits of Magellan, and of the gigantic race of People called Patagonians;
 also a Survey of several Islands discovered in the Southern Hemisphere; together with a minute, cir-
 cumstantial, and full Description of the several Places, People, Animals, Vegetables, and Natural
 Curiosities, discovered and seen in the Course of this remarkable Voyage; which was begun on the
 3d of July 1764, and completed the 9th of May, 1766; containing a Period of little more than
 Twenty-two Months, and included in the Year 1764, 1765, and 1766.

C H A P. I.

*Extraordinary preparations made, and precautions used, for this voyage—Names of the two ships, number of men, &c.—Cir-
 cumstances previous to hoisting the broad pendant, and our setting sail—The Dolphin takes in her guns at Long Reach, and
 is there joined by the Tamar frigate—They sail from the Downs, and arrive at Plymouth—Anchor in the sound—Passage
 from Plymouth to Madeira—Observations on this island—Run from hence to St. Jago one of the Cape de Verd Islands, and
 anchor in Port Praya—Observations on the island and port—They make the coast of Brazil, and enter the harbour of Rio
 de Janeiro—Observations—Departure from this port, bound, as we thought, to the East Indies—Orders made known,
 which were to go on discoveries to the South Sea—The Dolphin and Tamar make Cape Blanco, Penguin Isle, and the har-
 bour of Port Desire—The Dolphin in danger of being lost at this last place—Observations on the harbour and adjacent
 country—Departure from Port Desire in search of Pepy's Island—Anchor on the coast of Patagonia, ten leagues within the
 mouth of the Straits of Magellan—An account of the extraordinary stature of some inhabitants seen there—Proceed up the
 Straits of Magellan to Port Famine—An account of the harbour, coast, and inhabitants—A description of the country,
 particularly the woods, and the beautiful Sedger—Favourable and pleasing circumstances during our stay here.*

A. D. 1764. **H**IS present Majesty, very early in life
 formed a plan of distinguishing his
 reign, by patronizing the prosecution of New Discover-
 ies in the unknown regions of the Southern Hemis-
 phere; and we have been told, that he declared his in-
 tention, soon after he came to the crown, of appropri-
 ating a great part of his revenue for that particular pur-
 pose. In 1764, orders were given for carrying this
 laudable design into execution; in consequence of
 which, on the 18th of April, preparations were made
 to fit out the Dolphin ship of war, and the Tamar
 frigate, for a supposed voyage to the East Indies. The
 Dolphin was a sixth rate, mounting 24 guns, and had
 three lieutenants, 37 petty officers, and 150 seamen on
 board; the Tamar mounted 16 guns, having on board
 three lieutenants, 22 petty officers, and 90 seamen.
 The honourable Commodore (now Admiral) Byron
 was appointed commander in chief, in the Dolphin,
 and the command under him, of the frigate, was given
 to Capt. Mouat. Both of these vessels were fitted out
 for the purpose of making discoveries of countries
 hitherto unknown, within the high southern latitudes,

convenient for navigation, and in climates adapted to
 the production of commodities useful in commerce,
 particularly in the Atlantic Ocean, between the Cape
 of Good Hope, and the Straits of Magellan. The
 instructions from the Admiralty-board to the commo-
 dore, likewise directed him to make an accurate survey
 of Pepy's Island, and those which had been named by
 Sir John Narborough, Faulkland's Islands, in honour
 of lord Faulkland; which, though first discovered, and
 since visited by British navigators, had never been suf-
 ficiently examined, so as that an accurate judgement
 might be formed of their coasts, natives, and produc-
 tions. Great care was taken, and extraordinary precau-
 tions used in preparing for this voyage. The bottom
 of the Dolphin was sheathed with copper; as were like-
 wise the braces and pintles for the use of the rudder,
 which was the first experiment of the kind, that had
 ever been made on any vessel. On the 14th of May,
 being ready for sea, she left the dock, when we received
 a number of men from the old hulks, which had been
 for some time used to receive on board materials for
 the use of the ship. The next day we got in our masts,
 and

and with all expedition possible, began to put up the rigging; the greatest part of the hands being now, from the time of her leaving the dock, principally employed in receiving the stores, and in shipping the ablest seamen, till the 9th of June, when we slipped our mooring, and sailed for Long Reach, where we received our guns, and were joined by our intended consort, the Tamar frigate.

On the 14th, we received on board a pilot for the Downs, and at six o'clock, A. M. weighed anchor with little wind, and with our boats a-head: our draught of water forward being then 15 feet six inches, and abaft 14 feet six inches. At seven o'clock the Dolphin striking the bottom, swung round; however, the ground being very muddy, it soon gave way, and this accident was attended with no other consequence, than her lying in the mud about two hours. This circumstance at our first setting out, which occasioned only a small delay, instead of checking the ardour of our men, served only to inspire them with hopes of meeting with fewer crosses in the prosecution of their voyage. On the 16th we anchored in the Downs, and moored the ship. During our continuance here, we sent the pilot on shore, and received from Deal a large twelve-oared barge for the service of our ship, with a quantity of fresh beef and greens. This day the Tamar passed us for Plymouth, and on the day following we received the honourable Capt. Byron on board.

Thursday the 21st, we weighed and sailed from the Downs; and in the night had a violent squall of wind, which, at that season of the year, might be reckoned rather uncommon. On the 22nd, at eight o'clock, A. M. we anchored in Plymouth Sound, and saluted the admiral with 13 guns; and at nine, having received a pilot on board, sailed into Hamouze, and lashed alongside the Sheer Hulk. As the Dolphin had taken the ground, the men on board were, according to orders, employed in getting out the guns and booms for docking; it being thought advisable to examine if she had sustained any damage, when it appeared, that the ship had happily not received any hurt. On the 28th she came out of dock, and having replaced her guns and stores, we sailed into the sound, where we moored, and found the Tamar lying between the island and the main, having unhung her rudder, to repair some small damage she had sustained. While we remained at Plymouth, our men received two months pay advance, in order to enable them to purchase necessaries; a privilege granted to all his Majesty's ships bound to distant ports; at which time the inhabitants on shore have the liberty of coming on board to sell them shirts, jackets, and trowsers, which are termed slops. After a stay of four days, the honourable John Byron, our Commodore, hoisted his broad-pendant, he being, as was reported, appointed commander in chief of all his Majesty's ships in the East Indies. Immediately upon this a signal was made for sailing, by firing a gun, and loosing our top sails, which being set, and another gun fired, we took our departure from Plymouth on the 3d of July, having his Majesty's frigate the Tamar in company.

On Wednesday the 4th of July, we shaped our course, with a fine breeze, for the island of Madeira, during which run, we had the vexation of observing, that our consort was a very heavy sailer. On Thursday the 12th, in the evening, we descried the rocks near Madeira called the Deferts, from their desolate appearance; and on the 13th we came to an anchor in Funchiale Bay; so named from the great abundance of a beautiful kind of fennel that grows on the shore. It is on the south part of the island, and at the bottom is the city of the same name, seated on a small plain, from which three rivers run into the sea, forming an island called Loo Rock, it being entirely barren. Upon this is placed a castle, and the town is also defended by a high wall, and a battery of cannon. This island is composed of one continued hill of a considerable height, extending from east to west; the declivity of which on the south-side is interspersed with vineyards; and in the midst of this slope are the country-seats of

the merchants, which add greatly to the beauty of the prospect. The air is so temperate, that the inhabitants feel little inconvenience from heat and cold, there being here a perpetual spring, which produces blossoms and fruit throughout the year. The soil is so fertile, that it produces more corn than any of the adjacent islands of double the extent. The grass shoots up so high, that they are obliged to burn it; and when they plant sugar canes in the ashes, in six months time they will produce a considerable quantity of sugar. The island abounds with fine cedar-trees, and almost all kinds of rich fruits, particularly grapes as large as our common plumbs; but all the fine fruits are too luscious to be eaten in any great quantities. The natives are said to make the best sweet-meats in the world: they excel too in preserving oranges, as also in making marmalades and perfumed pastes. The sugar made here is not only remarkably fine, but has the smell of violets; and the wine of this island will keep better in long voyages and in hot countries, than that of any other place in the known world, on which account great quantities of it are bought up for the use of ships, and exported to the West Indies. Their convents have a venerable appearance, from their age and structure. Some of the nuns belonging to them are handsome, and, at particular hours, have the liberty of conversing with strangers, through a double barred grate. Their chief employment consists in making curious flowers of all sorts, little baskets, and other trinkets, in needlework, which they sell to their visitors, and the money is appropriated to the use of the convents. Notwithstanding the extraordinary fertility of the island, provisions of all kinds are very dear, the inhabitants living chiefly on fruit and roots. There are some hogs and fowls; but they cannot be procured without great difficulty, except by way of exchange for old cloaths, which in whatever condition, or of whatever kind, are eagerly sought after by the poor among the natives. While we continued here, we were supplied with fresh beef, very indifferent of the kind, as their bullocks, either from want of sweet pasture, or from nature, are both lean, and under the common size. On our arrival in the road of Funchiale, we found the Ferrit and Crown sloop lying at anchor, who saluted our Commodore on his hoisting the broad-pendant, the fort also returned our salute with eleven guns; and on the 14th, Commodore Byron waited on the governor, by whom he was received with great politeness; and on the day following the governor returned his visit at the house of the consul. Having taken in our water, wine, and other refreshments for the use of both the ships companies, on the 19th we began to prepare for proceeding on our voyage.

On Friday the 20th, we took leave of the governor by firing eleven guns, which compliment he returned from the citadel; and at three o'clock, A. M. we weighed anchor and set sail, in company with his Majesty's ships the Crown, Ferrit, and Tamar. It is observable, that in leaving this island ships are in a manner becalmed, till they get four or five leagues to the leeward, where they are sure to find a brisk trading wind. The next day we made the island of Palma, one of the Canaries. We now parted company with the Crown and Ferrit, and on the 22d spoke with his Majesty's ship Liverpool from the East Indies, by whom we sent letters to England. This day we examined our water-casks, and concluded, we were under a necessity to touch at one of the Cape de Verd islands for a fresh supply. On the 26th, our water being foul and stinking, we were obliged to have recourse to a kind of ventilator, which forced the air through the water in a continued stream, whereby it was purified. On the 27th in the morning, we made the isle of Sal, one of the Cape de Verds, when observing several turtles on the surface of the sea, we hoisted out our boat, in order to strike some of them, but they all disappeared before our people were within reach of them. Indeed we had little chance of catching any sorts of fish, for none of the finny tribe would come near the ship, because she was sheathed with copper.

On Monday the 30th, at two o'clock P. M. we saw the island of St. Jago; and at three came to an anchor, about a mile from the shore, in the bay called Port Praya, in nine fathoms water, having saluted a small fortification belonging to the Portuguese, who returned the compliment. At this time it was near the rainy season, which, when set in, renders this harbour very unsafe; for a rolling swell from the southward makes a frightful surf on the shore, and every hour a tornado may be expected, which at times is very furious, and may produce fatal consequences to shipping; on which account no vessel comes here after the 15th of August, till the rainy season is over, which is in the month of November. St. Jago is the largest and most fruitful of all the Cape de Verd islands; and notwithstanding its being rocky and mountainous, the valleys not only produce Indian corn, but fruits of various kinds, and plenty of cotton. The island has four towns, besides Ribeira Grande, the capital, in which resides the governor, Oviodone, and bishop. Most of the priests are negroes, as indeed are far the greatest part of the inhabitants, there being only about three whites to forty blacks, who have scarce cloaths sufficient to cover their nakedness. There are but few soldiers, and those, to outward appearance, are most indigent wretches. A ship no sooner arrives, than the natives flock from all parts of the island with different kinds of provisions; and these they exchange for old clothes, particularly black, on which they set the highest value, and for a mere trifle of that kind, you may be provided with a sufficient quantity of turkeys, geese, fruit, and other necessary articles of sea-stock. But, however wretched these people may appear at the first view, they live in the greatest plenty, and from the fertility of the soil, enjoy not only the necessities, but what, in other places would be esteemed the luxuries of life. Having by this time got on board a supply of water, fresh provisions, and fruit, we unmoored, signal having been made for our departure.

On Thursday, the 2nd of August, we got under sail, and put to sea, with the Tamarin company. Soon after, the scorching heat, and unceasing rain, affected the health of our crew, many of whom began to fall down in fevers, notwithstanding the commodore took the utmost care to make the men, who were wet, shift themselves, before they laid down to sleep. On the 8th we lost a good deal of way, by shortening sail till the Tamarin came up, who had her topsail yard carried away. In these hot latitudes, ships generally take fish in plenty, but we were not able to catch one, the cause of which disappointment, we have already noticed.

On Thursday, the 11th of September, we descried Cape Frio, on the coast of Brazil, in the 23d degree of south latitude, and the 42nd deg. 20 min. W. longitude from London. The next day, about noon, we entered the harbour of Rio de Janeiro, and anchored in eighteen fathoms water, fort St. Acrouse bearing S. E. half S. a remarkable peak, in the form of a sugar-loaf, presenting itself to our view on the larboard side, at the south by east, and Snake's Island, which is the largest in the harbour, appearing close by the town at W. N. W. and the north end of the town at W. half N. On the 14th, we received a pilot on board, and ran in between the island and main, not a quarter of a mile from the shore, and at noon saluted the citadel with eleven guns, which were immediately returned. Our first care was to get on board fresh provisions for the ships companies, which began to be in great want of them, especially of greens, the scurvy having already made its appearance among the men on board. On the 19th, our Commodore visited the governor, who received him in state, putting the guard under arms: the nobility conducted him to the viceroy's palace, while 15 guns were fired in honour of the British flag: his excellency afterwards returned the visit, and was received by the Commodore on board the Dolphin, in a manner suitable to his high rank. On this occasion all hands manned the ship, standing on the yards with their arms extended just to touch each other;

No. 26.

and a salute was given with 15 guns, which was returned by an equal number from the citadel. On the 9th of October, Lord Clive, in the Kent Indianman, paid Commodore Byron a visit, when he likewise received the same compliment, both at his coming on board, and his going away. The same day a pilot came on board to conduct us into the road, and at six o'clock P. M. we weighed, and set our sails; but having little wind, we were obliged to come again to an anchor, and wait till the next morning, during which time we had an opportunity of making a few observations on the harbour, which seems capable of receiving an hundred sail of ships in good anchorage, with sufficient room for them to ride in safety. The town of Rio de Janeiro is commodiously seated at the back of Snake's island, which being not above five hundred yards from it, commands, from the fortifications erected on it, every thing that can possibly come to annoy the town; and there are several other islands at the entrance fortified with different batteries. These fortifications appear so formidable in the eyes of the Portuguese, that they are so vain as to think, the whole power of Europe would not be sufficient to deprive them of their possession; yet we may safely affirm, that six sail of our men of war of the line would be able to destroy all their batteries in a few hours.

From the 15th of September to the 18th of October, our men were employed in watering, wooding, caulking, &c. We had six Portuguese caulkers to assist our carpenter, who were paid at the rate of six shillings sterling per diem, though it is certain, that one of our English caulkers would do as much in one day, as they could do in three; but though slow and inactive, they perform their work very completely. In this port the air is refreshed by a constant succession of land and sea-breezes; the former comes in the morning, and continues till towards one o'clock, and soon after is regularly succeeded by a strong sea-breeze. These contribute to render the port very healthy and pleasant, and are justly esteemed so salutary, that the negroes term the sea-breeze the Doctor. The soil of Brazil is generally fertile, it producing a variety of lofty trees fit for any use, many of them unknown in Europe; and the woods abound with rich fruits, among which are a considerable number that are neither known in Europe, nor in any parts of America. Oranges and lemons grow here in as great plenty, as nuts in our woods in England. The sugar-cane flourishes here in the utmost perfection, and great quantities of excellent sugar, indigo, and cotton, are exported from hence into Europe. Great quantities of gold are also found by the slaves, numbers of whom are employed in searching for it in gullies of torrents, and at the bottom of rivers; and this country is also famous for its diamonds. With respect to the animals of Brazil, all the horses, cows, dogs and cats are said to have been brought from Europe: among those natural to the country are a great variety of monkeys, Peruvian sheep, deer and hares; the racoon, the armadillo, the flying squirrel, the guano, the opossum, the ant-bear, and the sloth. Among the fowls are many parrots, paroquets, macaws, and other birds remarkable for the beauty of their plumage; with a great variety of singing birds, and several species of wild geese, wild ducks, common poultry, partridges, wood-pigeons and curlews. However, the country of Brazil is no less remarkable for the multitude, the variety, and incredible size of its snakes, and other venomous reptiles. In Rio de Janeiro the viceroy is invested with the same power over the natives, as the king of Portugal enjoys over his subjects in Lisbon. The inhabitants, who are of a brown complexion, have a great number of negro slaves, which they purchase in the public markets, where they are chained two and two together, and generally driven round the town to be exposed to view. The women here are very swarthy, and have disagreeable features; but those of a superior rank are seldom seen, as they are never suffered to go out of doors but by night. The Portuguese are naturally of so jealous a disposition, that strangers, merely by looking at their women incur their resentment, and are

in danger of suffering by that spirit of revenge, which universally prevails in this country; on which account the women are obliged to be always on their guard. Indeed, they here seldom enter upon matrimony; but when tired of each other, they separate by mutual consent, and then endeavour to find out another paramour to supply the place of the former. As soon as the evening approaches, the Portuguese of this city go their rounds, and enter upon scenes of debauchery, which we may venture to affirm are as frequent and flagitious as those between the inhabitants of Lisbon. Rio de Janeiro is seated near the side of a number of high hills, from whence to the southward is a very large aqueduct, which supplies the whole town with water. This aqueduct, which extends across a deep valley, consists of above fifty arches placed in two rows, one upon another, and in some parts rises upwards of a hundred yards from the bottom of the valley. By this means the water is conveyed into two fountains, from whence the inhabitants fetch all they want. These stand opposite the viceroys palace, which is a stately stone building, and the only one in the whole city that has windows; the other houses in the town having only lattices. At the further end of the palace stands the jail for criminals, which from its structure, and the multiplicity of its iron grates, is far from adding any beauty to the palace, to which it joins. The churches and the convents are extremely magnificent, and calculated to strike the passions of the people who resort to them. On the altar pieces, and other parts of those structures, are many fine figures of our Saviour, the Virgin Mary, the Apostles, and other saints. In these churches a great number of friars and monks of different orders are constantly employed to celebrate mass to as many as happen to assemble; the churches being always open, and wax tapers kept continually burning; whence, in passing by these structures, all those of their persuasion pay due reverence, by pulling off their hats, and crossing themselves, with every other token of respect. In almost every corner of the streets are niches, in some of which are placed crucifixes, and in others some saint, dressed in linen and silk, or other stuffs. The cathedral and Jesuits college, which are the most magnificent buildings in the city, may be seen from the harbour, and form an agreeable distant prospect. A considerable trade is carried on here by a number of merchants who reside in the city. Every year at least forty or fifty sail of ships come from Lisbon, and different parts of the Brazils, besides some ships that trade to Africa, and the small craft that frequent the neighbouring ports. The European ships bring leather, linen, and woollen cloths, coarse and fine bays, serges, hats, stockings, thread, biscuit, iron, hardware, pewter, and all kinds of kitchen furniture, with other commodities; and in return carry from thence sugar, tobacco, snuff, brasil, and other drying and medicinal woods, fustic, raw hides, train oil, &c. With respect to their food, it must be acknowledged, that their beef is very indifferent, as through the excessive heat of the weather, they are obliged to eat it soon after killing, which is performed in the following manner: they drive a number of bullocks into an inclosed place, and then throwing a rope over that they intend to kill, take him out from among the rest, and confine his head down by means of the rope, when a negro butcher coming behind him, cuts the hamstrings of his hind legs, and when the beast falls, he sticks a knife in his head exactly between his horns. These cattle are so wild and unmanageable, that few, except negro butchers, chuse to encounter them; and yet they are so small, that when the skin, ossal, &c. are taken away, they in general do not weigh more than two hundred and a half. Such are the ingenious remarks of our journalist, who was an officer on board the Dolphin; and our readers will, perhaps, remember, that we have given a full and complete account of the Brasils, and Rio de Janeiro, in the 7th and some of the following pages of this work.

While we continued at the Brazils, yams were served to the ship's company instead of bread, at two pounds a day each man: but we procured sugar, tobacco, and

other commodities at a very reasonable price. Fowls and hogs are however very dear, the chief food of the negroes being fish and Indian corn, the latter of which they cultivate in great quantities, and plenty of the former they catch out at sea, they having a considerable number of fishing canoes, in which they go out in the morning, assisted by the land-breeze, which, as we have before observed, rises regularly at that time, and return in the evening with the sea-breeze, which is no less invariable. In this port they have not only a yard for building ships, but a convenient island, where they can heave down a vessel of any size. A Spanish South-seaman, was obliged to put into this port, while we lay here, in order to heave down, and repair the damage she had sustained. During our stay, Commodore Byron lived on shore, having a commodious house situated on the top of a hill to the northward, where the viceroy and others paid him frequent visits, and shewed him all the respect, that a stranger of his rank could possibly claim. The following piece of information may be of service to future navigators, particularly to those of our own nation.—“The Portuguese, at Janeiro, practice every artifice in their power to entice away the seamen from the ships which touch there; and if by cajoling or intoxicating them, they can get any men within their power, they immediately send such up the country, and keep them there till the ship to which they belong has left the place. By these arts, five men from the Dolphin, and nine from the Tamar, were seduced; the latter were recovered, but the former were effectually secreted.” All hands were now, being the 16th of October, employed to complete the fitting the Dolphin and Tamar for sea, having all the reason possible to believe, that we were bound to the East-Indies, and that we should now proceed to the Cape of Good Hope, the scheme having been so well concerted by the Commodore, as even to deceive Lord Clive, who pressed him with great importunity to allow him to take his passage in the Dolphin, we being in much greater readiness for sea than the Kent, which had besides the misfortune to have many sick on board: but to this the Commodore could not consent; yet flattered his lordship with the hopes of his taking him on board on their meeting at the Cape.

On Saturday, the 20th, we left this port, and the coast of Brazil, bound as we thought for the Cape of Good Hope, but when at sea, by steering to the southward, we to our great surprize found our mistake; and on the 22nd, we were relieved from our suspense; for a signal being made for the commander of the Tamar frigate to come on board, he and our own company were informed, that the Commodore's orders were to go on discoveries into the South Sea: a circumstance that, from the manner of which it was received, furnishes the greatest reason to believe, that no one on board had before the least notice of the voyage in which they were now engaged. To this information the Commodore added, that the good behaviour of our company, by order of the lords of the Admiralty, would be rewarded, with double pay, and other emoluments. This declaration was received with marks of the highest satisfaction; the crew promised obedience to the Commodore as to any orders he should give, and expressed their willingness to do all in their power for the service of their country. Some French writers have given a forced and very malevolent turn to this generous conduct; but the daring spirit which characterizes British seamen is too well known, for any one to suppose, that an increase of pay was necessary to prompt them to do their duty in perilous service: and the instances of disinterested generosity which distinguish the British nation, cannot leave the true motive which actuated the board of Admiralty, when it thus distributed its bounty, any ways equivocal, or exposed to the misconstruction of invidious men. To make the acquiescence of the French sailors, under the inattention of their government, when M. de Bougainville sailed round the world, an occasion for casting a reflection on the English sailors, for the contrary conduct of government, in a similar circumstance, bespeaks a species of mean subtlety, which can disgrace none but those

those who practice it, and which the spirited rivalship of that polished nation does not countenance.

On Monday, the 29th, it blew a violent hurricane, and during the storm we were obliged to throw four of our guns overboard. It continued all night, but subsided on the morning of the 30th, when we made sail, and being arrived in latitude 35 deg. 30 min. S. we found the weather exceeding cold, though at this time the latter end of October, which answers to our April, in the northern and temperate zone, and we were besides sixteen degrees nearer the line than at London. A little more than a week before, we had suffered intolerable heat, so that such a sudden change was most severely felt. The seamen, having supposed, that they were to continue in a hot climate during the whole voyage, had disposed of all their warm cloathing at the ports where we had touched, as also their very bedding; so that now, finding their mistake, and being pinched with cold, they applied for fops, and were furnished with the necessary articles for a cold climate.

On Friday the 2nd of November, the Commodore delivered to the lieutenants of both ships their commissions, they having hitherto acted only under verbal orders from him. On the 4th, the ship was surrounded with vast flocks of birds, among which were some brown and white, and several pintadoes, somewhat larger than pigeons. We also in latitude 38 deg. 53 min. S. and in 51 deg. W. longitude, saw a quantity of rock weed, and several seals. On the 10th, we perceived the water discoloured; and the next day we stood in for land, being in latitude 41 deg. 16 min. S. and in 55 deg. 17 min. W. longitude. On the 11th, we steered all night S. W. by W. and on Monday the 12th, we found ground at the depth of 45 fathoms: our latitude was 42 deg. 34 min. S. longitude 58 deg. 17 min. W. About four o'clock, P. M. our people in the forecabin called out, "Land right a-head!" At this time it was exceeding black round the horizon, and we had a good deal of thunder and lightening: the Commodore himself imagined what we first desiered to be an island, which seemed to rise in two rude craggy hills; the land adjoining to it appeared to run a long way to the S. E. We were now steering in a S. W. direction, and founded in 52 fathoms water. Our commander thought himself embayed, and entertained little hope of getting clear before night. We now steered E. S. E. the land still keeping the same appearance, and the hills looking blue, as they generally do at a small distance, when seen in dark rainy weather. Many on board asserted, that they saw the sea break upon the sandy beaches, but after having made sail about an hour, what had been taken for land, in a moment vanished; and, to the astonishment of every one, proved to have been a mere *deceptio visus*, which seamen call a fog-bank. These delusions are frequently occasioned by ridges of clouds, and sometimes, in the higher latitudes, by an extraordinary quality of the air, to be accounted for only by the doctrine of refraction. Others have been equally deceived by these kind of illusions. The master of a vessel, not long since made oath, that he had seen an island between the west end of Ireland and Newfoundland, and even distinguished the trees that grew upon it; yet it is now well known, that no such island exists, at least it could never be found, though several ships were afterwards sent out on purpose to seek it. And Commodore Byron was of opinion, that if the weather had not cleared up soon enough for us to see what we had taken for land disappear, every man on board would freely have made oath that land had been discovered in this latitude of 43 deg. 46 min. S. and in 60 deg. 5 min. W. longitude. This false appearance was succeeded, on Tuesday the 13th, by a sudden and tremendous hurricane. Notwithstanding the weather was extremely fine, in the afternoon the sky grew black to windward, and a noise was heard, which resembled the breaking of the sea upon a shallow beach. The birds were observed flying from the quarter whence the storm issued, and shrieking through the apprehension of its approach. It was not possible to make the necessary preparations before it reached us.

The sea rolled on towards us in vast billows covered with foam. Orders were instantly given to haul up the fore sail, and let go the main sheet; but before we could raise the main tack, the Dolphin was laid upon her beams. We now cut the main tack; for it was impossible to cast it off, upon which, the main sheet struck down the first lieutenant, much bruised him; and beat out three of his teeth. The main-top sail not being quite handed was split to pieces. The Tamar split her main-sail, but being to the leeward, she had more time to prepare; and had not sufficient warning been given by the agitation of the sea, the Dolphin must have been overfet, or her masts would have been carried away. It was the opinion of all our people, that had this storm approached with less warning, and more violence, or had it overtaken us in the night, the ship must have been lost. Our Commodore thought this gust of wind more violent than any one he had encountered; it lasted about twenty minutes, and then subsided. It blew, however, hard all night, and on the 14th, we had a great swell. The sea also appeared as if tinged with blood, owing to its being covered with small red crayfish, of which great quantities were taken up in baskets by the ship's company.

On the 15th, our three lieutenants and the master were so ill as to be incapable of doing their duty; but the rest of our hands were in good health. Our latitude this day was 45 deg. 21 min. and longitude 63 deg. 2 min. E. On the 16th, we shaped our course for Cape Blanco, agreeable to the chart of it, laid down in Anson's voyage; and after many hard gales of wind, on the 17th, we saw the Cape, and for two days struggled hard to reach Port Desire. We now stood into a bay to the southward of the Cape, but could find no port. On the 20th, we made Penguin Island, and as Port Desire was said to be three leagues to the N. W. of it, a boat was sent out, and having found it we stood in for land; and anchored four miles from the shore.

On Wednesday the 21st, we weighed in order to enter the harbour of Port Desire; but found it very rocky, and not above a quarter of a mile from side to side. On our sailing up, the wind was at S. S. W. directly in our favour, and the weather being remarkably temperate, all our boats were round the ship; but on a sudden the wind came about to the N. E. which being directly against us, we made all possible haste to get our sails furled; but being within the harbour we could not return, and the tide of flood running with excessive rapidity, we were obliged to let go both anchors, and before we could bring her up, she took the shore. This was followed by a cold rainy night, rendered more melancholy and gloomy by the reflection, that the boats were all driven to sea, where every person in them would probably perish, and that we ourselves had no reason to expect our ever getting off, as both the wind and tide were against us, but that we should be obliged to live, or perhaps perish, on this desert coast of Patagonia, several hundred leagues to the southward of any European settlement; but at length, to our great joy, our twelve-oared barge providentially drove into the harbour, by which means the ship was preserved, for without this timely assistance she must have perished, we having no boat to carry out an anchor. After many attempts, we carried out our stream anchor, which, when the tide turned, enabled us, by weighing our other anchors, to get into the middle of the harbour, where, with the Tamar in company, we moored both ships: but as it blew very hard, we were obliged to take down our yards and topmasts. Mean while two of our boats had been driven on shore, and the men suffered extremely from its raining very hard all night: but notwithstanding this they returned the next day. As to our long boat, it was carried many leagues out to sea, with only two men in it; we had therefore little prospect of seeing them again; but on the 23d they returned with the boat into harbour, though they were almost starved to death with the severity of the cold and want. On their first appearance we sent a boat to their assistance, which brought them on board.

This

This harbour is not much more than half a mile over. On the south shore is a remarkable rock, rising from the water in the form of a steeple, which appears on entering the harbour's mouth. Abreast of this rock we lay at anchor in seven or eight fathoms water, moored to the east and west, with both bowers, which we found extremely necessary, on account of the strong tide that regularly ebbs and flows every twelve hours. Indeed the ebb is so rapid, that we found by our log line it continued to run five or six knots an hour; and in ten minutes after the ebb is past, the flood returns with equal velocity: besides, the wind generally blows during the whole night out of the harbour. It is also necessary to observe, that the ground is far from affording good anchorage; for as it principally consists of light sand, it is not to be depended on, and if one anchor should start, while the tide is rushing in, the ship would immediately take the shore, before the other anchors would possibly bring her up. However it may be fairly conjectured, that there is firmer anchorage farther up the harbour, especially for a ship that requires only a small draught of water; for on sending our boats two or three leagues up, they found good anchorage and less tide. On the north shore, about four or five miles above the before mentioned rock, there are some white cliffs that rise to a great height, and at a distance nearly resembling chalk, though their whiteness is merely owing to great flocks of birds voiding their dung upon them. The country all around is likewise interspersed with rocks, high and craggy, but between each precipice the ground is covered with long and coarse grass. The valleys form a barren comfortless prospect, in which there is nothing to entertain the eye but great numbers of wild beasts and birds, and many large heaps of bones that lie scattered about, especially by the side of every stream of water. But we saw no Indians, nor the least sign of the human species. Among the animals we found near the shore a great number of seals of different sizes. These live both on the land and in the water, and are so fierce that they cannot be encountered without danger. The head has some resemblance to that of a dog with cropt ears, but in some it is of a rounder, and in others of a longer make. They have large eyes, and whiskers about the mouth: their teeth are extremely sharp, and so strong, that they can bite a very thick stick in two. Though without legs, they have a kind of feet or fins, which answer the different purposes of swimming and walking; these have five toes like fingers, armed with nails, and joined together with a thin skin like those of a goose; by the help of which they shuffle along very fast through the sand, or over the small rocks on the shore. Their skins, which are covered with short thick hair, are black, but frequently spotted with different colours, as white, red, or grey, and are often manufactured into caps, waistcoats, tobacco-pouches, and the like. The old ones, which are about eight feet long, make a hoarse barking, somewhat like a dog, and the young ones mew like a cat. The largest of them will yield about half a barrel of oil; and their skins, if properly cured, would be of considerable value. Some of our men used to eat the young ones, and their entrails were thought by them as good as those of a hog. Here are likewise great numbers of guanicoes, a kind of wild deer, called by some Peruvian sheep, their backs being covered with a very fine soft wool. They have a long neck, and the head resembles that of a sheep; but they have very long legs, and are cloven footed like a deer, with a short bushy tail. These are as large as a middle sized cow, and when freed from the skin and offal, weigh about two hundred and a half. Their flesh is excellent, either fresh or salted, and after so long a voyage, was very serviceable in refreshing our seamen. They herd together in companies of twenty or more, and the method we pursued in killing them was by sending a party of men in the night, who searched for them by the springs of water to which they resort; and there lying in ambush among the bushes, they had an opportunity of shooting them at their pleasure; yet these animals, when sensible of danger, suddenly

escape; for they are very swift of foot. In this place are also hares of a prodigious size; for they weigh, while alive, near 20 pounds, and, when skinned, are as big as a fox. These are chiefly inhabitants of the valleys. With respect to the feathered race, here are a great number of ostriches, but not near so large as those in Africa. These birds, which are remarkable for the length of their necks and legs, and the shortness of their wings, have been considered by naturalists as holding the same place among birds, as camels do among beasts. Their small head has some resemblance to that of a goose, and their plumage consists of grey feathers covering the back as far as the tail, but those on the belly are white. They have four toes on each foot, one behind and three before; and from the shortness of their wings, are unable to raise their bodies from the ground; yet by their help they will run with amazing swiftness. We found great quantities of their eggs, some of which are of an enormous size. There is here also another extraordinary large bird, which we called the wild eagle, whose body is about the size of a large turkey of 30 pounds weight. They have a very stately appearance, and are of a dark brown hue, intermixed with different coloured feathers; but what is most curious in these birds, is their having a crown on their heads, and a ring of feathers round their necks. The barrels of the large feathers, or quills in their wings, are each half an inch in diameter, and their wings when extended reach 14 feet from point to point. The penguin, which is also found here, is about the size of a goose; but instead of feathers is covered with a kind of ash-coloured down. Its wings, which resemble those of young gossins, are too short and unfledged to permit it to fly, but are of use to it in swimming, and also to assist it in leaping along upon the ground. These birds appear heavy and inactive upon land, where they seem regardless of danger, and are easily knocked down with a stick; yet are active enough upon the water. Their flesh, however, is disagreeable, on account of its having a fishy taste; but their eggs are very good. In the evening they retire to the rocks near the sea, where they stay till the morning. But to return to the history of our voyage.

On Saturday the 24th, both ships being safely moored in the harbour, the Commodore went on shore and shot a hare, weighing 26 pounds, and saw others which appeared to be as large as fawns. Landing again on the 25th, he found the barrel of an old musket, with the king's broad arrow on it, and an oar of a singular form. The musket barrel had suffered so much by the weather, that it might be crumbled to dust between the fingers; it was probably left there by the Wager's people, or by Sir John Narborough, when he was in these parts. Here were some remains of fire, but no inhabitants could be discovered. This party shot several wild ducks, and a hare, which ran two miles before it dropped, with the ball in its body; the flesh of which animal was of an excellent flavour, and as white as snow. Here they found the skull and bones of a man; and caught a young guanicoe, very beautiful, and which grew very tame on board, but died a short time afterwards. On the 27th, we discovered two springs of tolerable good water; and on the 28th, a tun of it was brought on board; but it is to be observed, the mineral qualities of these springs unfortunately prevented their being of any use to us in supplying our ship with water; and we could not even find a quantity of pure wholesome water fit for our present use. We had sunk several wells to a considerable depth, where the ground appeared moist, but upon visiting them, had the mortification to find, that, altogether, they would not yield more than thirty gallons in 24 hours. On the south shore the rocks are not so numerous as on the north side; and there are more hills and deep valleys; but they are covered only with high grass, and a few small shrubs. Hence this is but a bad place to touch at, by any ship that is under the necessity of wooding and watering. This day, when a party went on shore, they saw such a number of birds take flight, as darkened the sky, nor could the men walk a step without tread-

Invito al banchetto a bordo della Kiowa, 1846.

ing on eggs; and as the birds hovered over their heads at a little distance, the men would knock down many of them with stones and sticks. After some time they dressed and would eat the eggs they had carried off, though young birds were in molt of them. They saw no traces of inhabitants on either side the river, but numerous herds of guanicoes, which were exceeding shy. The surgeon of the Dolphin, one of the party, shot a tiger-cat, a small, but very fierce animal. Some of the crew being sent on shore for water, on the 30th, two of them discovered a large tiger lying on the ground. The animal taking no notice of them, they threw stones at him, but could by no means provoke him. He remained on the spot, and continued stretched on the ground, till their companions, who were a little way behind them, came up, and then he walked away very leisurely.

During our stay at this place, our men were employed in fitting and completing the ship for sea; and the carpenters were particularly obliged to fish our main-mast, which had been damaged at the head. Others, as has been already mentioned, were employed as rangers to go in search of water, though without success; but when they were on this duty, they had a double allowance of brandy, and small tents were erected on shore for their own use. Before our departure, we also sunk two casks, one of them on the north shore from the place of anchorage, a-breast of the rock in form of a steeple. The other cask was sunk on the south shore, two miles and a half to the S. S. W. of the steeple rock, and near a gentle declivity, on which we erected a post twelve feet high from the ground, with a piece of board nailed across it by way of mark. At length having equipped the ship for sea, and received proper ballast from the shore, signal was made for sailing. Our crew were greatly refreshed by the provisions they met with at this place, having had the flesh of the guanicoes served three times a week, which they found to be delicious food; and this, doubtless, contributed greatly to their continuing in a good state of health, as were also all on board our consort the Tamar: besides a perfect unanimity subsisted between the officers and men of both ships, who maintained the most friendly intercourse with each other, whenever they had an opportunity. On Saturday, the 1st of December, our cutter being thoroughly repaired, we took her on board, and on the 2nd, we struck our tents, which had been set up at the watering-place. This bears about S. S. E. of the steeple rock, from which it is distant about two miles and an half.

On Wednesday, the 5th, we unmoored, and between five and six in the evening weighed. We now got under sail, having fair and pleasant weather, and steered out E. N. E. with a favourable gale at N. N. W. directing our course from Port Desire, in search of Peppy's Island, said to have been seen by Cowley, who lays it down in latitude 47 deg. but makes no mention of its longitude. In our charts it is laid down in longitude of 64 deg. from the meridian of London, bearing E. by S. of Cape Blanco; and it received its name in honour of Samuel Pepys, Esq. secretary to James duke of York, when lord high admiral of England; who pretended, that it had not only a good harbour, in which a thousand ships might safely ride at anchor, but that it abounded with wild fowls, and was extremely convenient for wooding and watering; but after many unsuccessful attempts to discover this island, in order to procure a fresh supply of wood and water, we had the mortification to find, that all our endeavours were in vain and ineffectual. We were therefore obliged to desist from the search, and on the 11th, at noon, the Commodore resolved to stand in for the main, both ships being in want of wood and water. Having changed our course, large whales were observed to swim frequently about the ship, and birds in great numbers flew round us. On the 15th, being in latitude 50 deg. 33 min. S. and in 66 deg. 59 min. W. longitude, we were, about six in the evening, overtaken by the hardest gale at S. W. that the Commodore had ever been in, with a sea still higher than any he had seen in going round Cape Horn

No. 26.

with lord Anson. The storm continued the whole night, during which we lay to under a balanced mizen, and shipped many heavy seas.

On Sunday the 16th, at eight o'clock A. M. it began to subside; at ten we made sail under our courses; and on the 18th, in latitude 51 deg. 8 min. S. and in longitude 71 deg. 4 min. W. we saw land from the mast head. Cape Virgin Mary (the north entrance of the Strait of Magellan) bore S. 19 deg. 50 min. W. distant nineteen leagues. The land, like that near Port Desire, was of the downy kind, without a single tree. On the 19th, we stood into a deep bay, at the bottom of which appeared a harbour; but we found it barred, the sea breaking quite from one side of it to the other. At low water it was rocky and almost dry; and we had only six fathom when we stood out again. In this place we observed porpoises, which were milk white, with black spots, pursuing the fish, of which there were great numbers.

Thursday, the 20th, we had little wind with thunder and lightning from the S. W. at four o'clock A. M. we saw an extremity of land belonging to Cape Fairweather, extending from S. to W. We were now at the distance of four leagues from the shore; when founding, we found twenty-five fathoms water, with soft ground, and the latitude of the Cape to be in 51 deg. 30 min. S. We never steered above five or six miles from the shore, and in passing between the last-mentioned Cape and Cape Blanco, we had no soundings with twenty-five fathoms line. The coast here appears in white cliffs, with level buff land, not unlike that about Dover and the South Forelands. We now came in sight of Cape Virgin Mary, from which we were distant five leagues, and also the land named Terra del Fuego. We found the coast to lie S. S. E. very different from Sir John Narborough's description; and a long spit of sand running to the southward of the Cape for more than a league. We had very fair weather all the morning, and at three o'clock P. M. Cape Virgin Mary bore N. W. half N. About two leagues to the westward, a low neck of land runs off from the Cape; we approached it without danger, and at six, anchored with the best bower in fifteen fathoms water, at which time the Cape bore N. half E. about seven miles; but the Tamar was so far to leeward, that she could not fetch the anchoring ground, and therefore kept under way all night. On the 21st, at three o'clock A. M. we weighed, and again got under sail; and at six the extremes of Terra del Fuego appeared, extending from the S. E. by S. to the S. W. by S. four or five leagues distant. At eight we perceived a good deal of smoke issuing from different quarters, and, on our nearer approach saw plainly a number of people on horseback. This is the coast of Patagonia, and the place where the half starved remains of the crew of the Wager, as they were passing the strait in their boat, after the loss of the ship, saw a number of horsemen, who waved what appeared to them like white handkerchiefs, inviting them to come on shore. Mr. Bulkley, the gunner of the Wager, who published an account of her voyage and misfortunes, says, that they were in doubt whether these people were Europeans, who had been shipwrecked on the coast, or natives of the country about the river Gallagoes. At ten o'clock, we anchored in fourteen fathoms on the north shore, and saw Cape Virgin Mary, which appeared over the low neck of land to the E. N. E. and Point Possession to the W. by S. We were now about a mile from the land, and had no sooner came to an anchor, than we saw with our glasses a number of horsemen, abreast of the Dolphin, riding backward and forward, and waving something white, as an invitation for us to come on shore. Immediately our twelve oared boat was hoisted out, which was manned with the Commodore, Mr. Marthal, the second lieutenant, the journalist, to whom we are indebted principally for the history of this voyage, and a party of men all well armed, Mr. Cumming, our first lieutenant, followed in the six oared cutter.

On our first approaching the coast, evident signs of surprize were visible among some in our boat, on seeing

men of a most enormous size, to the number of about five hundred; while others, perhaps, to encourage the rest, observed, that those gigantic people were as much surprized at the sight of our mulkets, as we were at seeing them; though it is highly probable they did not know their use, and had never heard the report of a gun: however, this was sufficient to remind us, that our fire-arms gave us an advantage much superior to that derived from stature and personal strength. The people on shore as we advanced kept waving and hallooing; but we could not perceive they had among them weapons of any kind. When we had rowed within twenty yards of the shore, we lay on our oars, and observed some on foot near the beach, but the greater part were on horseback, drawn up upon a stony spit, which ran a good way into the sea, and where it was very difficult to land, the water being shallow, and the stones very large. They now shouted with great vociferation, and by their countenances seemed eagerly desirous of having us land. After the most amicable signs which we were capable of understanding, or they of giving, a signal was made for them to retire backwards, to a little distance, with which they readily complied. The Commodore now held a short consultation with his officers on the propriety of landing, when one, fired with the thoughts of making a full discovery in regard to these Indians, made a motion to approach nearer and jump on shore, but the Commodore objected to it, and would not suffer any man to go before himself. In a short time we attempted to land, most of our boat's crew being up to the middle in water. The Commodore, regardless of such kind of difficulties, pushed resolutely on, and, having with great intrepidity leaped on shore, drew up his men upon the beach, with the officers at their head, and ordered them not to move from that station, till he should either call or beckon to them. Commodore Byron now advanced alone towards the Indians; but perceiving they retreated as he advanced, upon this he made signs, that one of them should come forward. These being understood, one who appeared afterwards to be a chief, advanced towards him. His stature was gigantic, he being nearly seven feet high. Round one of his eyes was a circle of black paint, and one of white round the other: the rest of his face was painted with various colours, and he had the skin of some wild beast, with the hair turned inwards, thrown over his shoulders. His hair was long and black, hanging down behind. The Commodore and Indian chief having paid their compliments to each other, in a language mutually unintelligible to the person to whom it was addressed, they walked together towards the main body of the natives, few of whom were shorter than the above-mentioned standard, and the women large in proportion. Mr. Byron now made signs for them to sit down on the ground which they did, and the old men chanted some strains, in a most doleful cadence, with an air of serious solemnity. The eyes of no one person were painted with the same colours, some being white and red, and some black and white. Their teeth are remarkably even, well set, and as white as ivory. Our Commodore, who had the precaution to take with him on shore a number of trinkets, such as strings of beads, and the like, in order to convince them of our amicable disposition, distributed them with great freedom, giving to each some as far as they went. He then took a whole piece of green ribbon, and putting the end into the hands of the first Indian, he continued it to the next, and so on as far as it would reach; while none of them attempted to pull it from the rest, and yet they seemed more delighted with it, than with the beads. When the ribbon was thus extended, he pulled out a pair of scissors, and cut it between each two of those who held it, leaving about a yard in the possession of each, which he afterwards tied about their heads. It was remarked, that though the presents were insufficient to supply them all, not one pressed forward from the station assigned him, nor seemed to envy the superior good fortune of his neighbour. They were now so delighted with the different trinkets, which they had an opportunity of viewing, as the beads hung round

their necks, and fell down before on their bosoms, that the Commodore could scarcely restrain them from caressing him, particularly the women, whose large and masculine features corresponded with the enormous size of their bodies. We saw some infants in their mothers arms, whose features, considering their age, bore the same proportion to those of their parents. Except the skins which these Indians wore, most of them were naked, a few only having upon their legs a kind of boot, with a short pointed stick fastened to each heel, which served as a spur. Some of their women had collars round their necks. Among them was one of the gigantic size, and most disagreeably painted, who had her hair adorned with beads of blue glass, hanging in two divisions down before her shoulders; she had also bracelets of pale gold, or brass, upon her arms. From whence this finery could be procured was a subject of wonder, as from their great amazement at first seeing us, we conjectured, that they had never beheld any of our dwarfish race before. It may, however, be concluded from the accounts of Sir John Narborough, and others, who have taken notice of these Indians, that they doubtless change their situation with the sun, spending their summer here, and in winter removing farther to the north, in order to enjoy the benefit of a milder climate. Hence Sir John and others have related, that they saw men of an uncommon size, at least eight or ten degrees more to the northward; whence it may be reasonably conjectured, that during one part of the year, they may have some intercourse with the Indians bordering on the Spanish settlements, and that from them they might have purchased these ornaments. There are those who may despise the fondness of these Goliath-like Indians for glass, beads, and other trifles which among civilized nations are held in no estimation; but such should remember, that, in themselves, the ornaments of unpolished and civil life are equal, and that those who live nearly in a state of nature, have nothing that resembles glass, so much as glass resembles a diamond; the value which we set upon a diamond, therefore, is more capricious than the value they set upon glass. The love of ornament seems to be a ruling passion in human nature, and the splendid transparency of glass, and the regular figure of a bead excite pleasing ideas. The pleasure which a diamond gives among us is, principally, by its being a mark of distinction, thus gratifying our vanity, which is independent of, and frequently over-rules natural taste, which is gratified by certain lines and hues, to which we give the name of beauty: it must be remembered also, that an Indian is more distinguished by a glass button or bead, than any individual among us by a diamond, though, perhaps, the same sacrifice is not made to his vanity, as the possession of his finery is rather a testimony of his good fortune, than of his influence or power in consequence of his having what, as the common medium of all earthly possessions, is supposed to confer virtual superiority, and intrinsic advantage. One of the Indians shewed our Commodore the bowl of a tobacco pipe, made of red earth, and by signs intimated that he wanted some tobacco, none of which they had among them. On this the Commodore beckoned to the seamen, who still remained drawn up on the beach, three or four of whom instantly running forward, the Indians were alarmed, and jumping up in an instant were preparing to retire, as it was supposed, to fetch their arms. The Commodore therefore stopped the sailors, directing one of them only to come forward, when he had got all the tobacco they could muster among them. This restored good harmony, and all the Indians resumed their places, except an old man who sung a long song, at nearly the conclusion of which Mr. Cumming brought the tobacco. This gentleman, though six feet two inches high, was himself astonished at the diminutive figure he cut among the strangers, who were broad and muscular in proportion to their height. Their language appeared to us to be nothing more than a jargon of sounds, without any mixture of the Spanish or Portuguese, the only European tongues of which it was possible for them to obtain any knowledge, and with which it is probable it would have been mixed, had they any

any immediate intercourse with the Spaniards or Portuguese of South America. We must not omit, that before our landing, the greatest part of these Patagonians were on horseback, but on seeing us gain the shore, they dismounted, and left their horses at some distance. These horses were not large, nor in good case, yet they were well broken, and very swift, but bore no proportion to the size of their riders. The bridle was a leathern thong, with a small piece of wood that served for a bit, and the saddles resembled the pads in use among the country people in England. Their women rode astride, and both men and women without stirrups; yet they galloped fearlessly over the spit upon which we landed, the stones of which were large, loose and slippery. These people looked frequently towards the sun with an air of adoration, and made motions with their fingers, in order to make us sensible of any particular circumstance they wanted us to understand. They appeared to be of an amiable and friendly disposition, and seemed to live in great unanimity among themselves. After they had been presented with the tobacco, they made signs for us to go with them to the smoke which we saw at a distance, and at the same time pointed to their mouths, as if intimating an inclination to give us refreshment; but their number at present being so greatly superior to ours, and it being not improbable, that still greater multitudes might surround us unawares from the inland country, our Commodore, who was equally remarkable for his prudence and bravery, thought it not advisable to venture any farther from the water side, and therefore intimated, that he must return to the ship, on which they sat down again, apparently much concerned. At length, after making signs that we would depart, with the most plausible promises, by gestures, of returning again to them from the ship, we left these Patagonian Indians, who were so distressed and afflicted at our departure, that we heard their lamentations for a considerable time after. When the Commodore took his leave of them they kept their seats, not one offering to detain, or follow him. Another officer on board the Dolphin, in his account of these extraordinary people, adds, that they all appeared to be very sagacious, easily understood the signals or intimations which our people made to them, and behaved with great complacency and good nature. Such is the information we have received from the papers of our journalist, whose veracity required no proof among those who have had the pleasure of his acquaintance; but as evidences in corroboration of his assertions, and the truth of the facts, we shall insert here the following account of the Patagonians, which we have received from a gentleman, who was also an officer in one of the ships, and on shore at the same time with our author.

The Dolphin having entered ten or twelve leagues into the mouth of the straits of Magellan, the men on deck observed thirty or forty people of an extraordinary stature, standing on the beach of the continent, who looking attentively on them, made friendly signs, by which they seemed to invite them to come on shore; while others who stood aloft, discovered with their glasses a much greater number, about a mile farther up the country; but ascribed their apparent size to the fogginess of the air. The ship happened at this instant to be becalmed; the honourable Mr. Byron, thinking no time would be lost by going ashore, resolved to land, in order to see these Indians, and learn what he could of their manners; he therefore ordered a six-oared boat for himself and officers; and one of twelve oars to be filled with men and arms, as a security, in case there should be any attempt to surprize or injure him, or any of those who went with him; though the people on shore did not seem to have any thing like an offensive weapon among them. On the Commodore's landing, in company with his lieutenant, he made signs to the Indians, who were crowding round him, to retire, which they very readily did, to the distance of thirty or forty yards. He then, attended by his lieutenant, advanced towards them, about twenty yards, and their number was soon increased to upwards of five hundred men,

women, and children. Several civilities at this time passed on both sides, the Indians expressing their joy and satisfaction, by singing uncouth songs, shaking hands, and sitting with looks of pleasure, with their wives and children round the Commodore, who distributed among them ribbons, and strings of beads, with which they appeared highly delighted. He tied necklaces round the necks of several of the women, who seemed to be from seven to eight feet high; but the men were for the most part about nine feet in height, and some more. The Commodore himself measures full six feet, and though he stood on tip-toe, he could but just reach the crown of one of the Indians head, who was not, by far, the tallest among them. The men are well made, broad set, and of a prodigious strength. Both sexes are of a copper colour; they have long black hair, and were covered partly with skins, which were fastened about their necks by a thong; the skins worn by the men being loose, but the womens were girt close with a kind of belt. Many of the men and women rode on horses, which were about fifteen hands and a half high, all of them astride; and they had among them some dogs which had a picked snout like a fox, and were nearly of the size of a middling pointer. These friendly people invited the Commodore, and all those who were landed, to go with them up the country, shewing a distant smoke, and pointing to their mouths, as if they intended to give us a repast; and in return, the Commodore invited the Indians to come on board, by pointing to his ship; but neither of them accepted of the others invitation, and therefore having passed two hours in an agreeable conversation, carried on wholly by signs, they parted with all the marks of friendship. The country (observes this gentleman) is sandy; but diversified with small hills; covered with a short grass, and with shrubs, none of which, as Sir John Narborough has long before remarked, is large enough to make the helve of an hatchet.

Another gentlemen on board has favoured us with an account that exactly tallies with the above, with these additional circumstances. That when they were ten or twelve leagues within the straits, they saw through their glasses many people on shore of a prodigious size: which extraordinary magnitude they thought to be a deception, occasioned by the haziness of the atmosphere, it being then somewhat foggy; but on coming near the land, they appeared of still greater bulk, and made amicable signs to our people to come on shore. That when the ship failed on to find a proper place of landing, they made lamentations, as if they were afraid our people were going off. He also says, there were near 400 of them, and about one third of the men on horses not much larger than ours; and that they rode with their knees up the horses withers, having no stirrups. That there were women, and many children, whom some of our people took up in their arms and kissed, which the Indians beheld with much seeming satisfaction. That by way of affection and esteem, they took his hand between theirs, and patted it; and that some of those he saw were ten feet high, well proportioned, and well featured; their skins were of a warm copper colour, and they had neither offensive nor defensive weapons. He also says, that they seemed particularly pleased with lieutenant Cumming, on account of his stature, he being six feet two inches high, and that some of them patted him on the shoulder, but their hands fell with such force, that it affected his whole frame.

There is nothing about which travellers are more divided, than concerning the height of these Patagonians. M. de Bougainville, who visited another part of this coast in the year 1767, asserts, that the Patagonians are not gigantic; and that what makes them appear so, is their prodigious broad shoulders, the size of their heads, and the thickness of all their limbs. Some time before the hon. Mr. Byron made this voyage, it was the subject of warm contest among men of science in this country, whether a race of men upon the coast of Patagonia, above the common stature, did really exist; and the contradictory reports, made by ocular

wit-

witnesses, concerning this fact, tended greatly to perplex the question. It appears that, during one hundred years, almost all navigators, of whatever country, agree in affirming the existence of a race of giants upon those coasts; but during another century, a much greater number agree in denying the fact, treating their predecessors as idle fabulists. *Barbenais* speaks of a race of giants in South America; and the *Unca Garcilassa de la Vega* in his history of *Peru*, is decisively on the same side of the question. For *quenado* lib. i. chap. 13 and 14, records the American traditions concerning a race of giants, and a deluge which happened in remote times, in these parts. Magellan, Loaisa, Sanniento, and Nodal, among the Spaniards; and Cavendish, Hawkins, and Kniver, among the English; Sebald, Oliver de Noort, le Maire, and Spilberg, among the Dutch, together with some French voyagers, all bear testimony to the fact, that the inhabitants of Patagonia were of a gigantic height: on the contrary, Winter, the Dutch admiral Hermite, Froger, in De Genne's narrative, and Sir John Narborough, deny it. Sir Francis Drake, who sailed through the straits, says nothing concerning it; and his silence on this head can only be accounted for on the supposition, either that he saw no inhabitants on the coast in his passage, or that there was nothing extraordinary in their appearance. To reconcile these different opinions, we have only to suppose that the country is inhabited by distinct races of men, one of whom is of a size beyond the ordinary pitch, the other not gigantic, though perhaps tall and remarkably large limbed; and that each possess parts of the country separate and remote from each other. That some giants inhabit these regions can now no longer be doubted; since the concurrent testimony of late English navigators, particularly Commodore Byron, Captains Wallis and Carteret, gentlemen of unquestionable veracity, establish the fact, from their not only having seen and conversed with these people, but even measured them. But it is time now to proceed with the history of our voyage.

On Friday the 21st of December, at three o'clock P. M. we weighed, and worked up the strait of Magellan, which is here about three leagues broad, not with a view to pass through it, but to take in a proper stock of wood and water, not chusing to trust wholly to the finding of Falkland's Islands, which we determined afterwards to seek. At eight in the evening we anchored in 25 fathoms water, at the distance of three miles N. N. E. from Port Possession, in view of two remarkable hummocks, which Bulkley, from their appearance, distinguished by the name of the Asses Ears. On the 22nd, at three o'clock A. M. we weighed and steered S. W. by W. about four leagues, when the water shoaled to six fathoms and a half, we being then over a bank of which no notice has hitherto been taken, and full three leagues from the shore; but in two or three casts of the log-line, it deepened to 13 fathoms. When the water was shallowest, the Asses Ears bore N. W. by W. and the north point of the first narrow W. by S. distant somewhat more than five miles. We now steered S. W. by S. two leagues to the first narrow, as it is usually called, which brought us through. This narrow is about three miles over, and is the narrowest part of the straits; and through it a regular tide runs with great rapidity. In this run we saw an Indian upon the south shore, who kept waving to us as long as we were in sight; also some guanicoes upon the hills. The land is on each side surrounded with these; but the country is entirely barren without a single tree, yet we here observed great quantities of smoke from different parts of the shore. The course of the first narrow to a little sea, or the sound, is S. W. by W. about eight leagues. The land on each side is of a moderate height, and rather highest on the north shore, but runs low towards the second narrow. On sounding from the first to the second narrow, we found from 20 to 25 fathoms water, with

good anchorage; and it was there about seven leagues from the north shore to the island of Terra del Fuego. At the entrance or east end of the second narrow lies Cape Gregory, which is a white cliff of a moderate height; and a little to the northward of it is a sandy bay, in which you may ride in eight fathoms water, with very good anchorage. When abreast of Cape Gregory we steered S. W. half W. five leagues, through the second narrow, having a depth of water from 20 to 25 fathoms. We went out of the west end of this narrow about noon, and steered three leagues south for Elizabeth's Island. At this part of the narrow on the south shore, is a white headland, called Sweepstakes Foreland. The wind being right against us we anchored in seven fathom. The island bore S. S. E. about a mile distant, and Bartholomew's Island bore E. S. E. In the evening six Indians came down to the water-side, and continued for some time waving and hallooing to us, but seeing their labour fruitless, they went away. Between the first and second narrows the flood sets to the S. W. and the ebb to the N. E. but being past the second narrow, the course with a leading wind is S. by E. three leagues between St. Bartholomew's and Elizabeth's Islands, where the channel is one mile and a half over. The flood sets through to the southward with great vehemence and rapidity, so that when near, it appears like breakers, and the tide round the islands sets different ways.

On Sunday the 23d we had very moderate weather, but hazy, with intervals of fresh breezes. In the morning we weighed, and worked between the two islands: we got over on the north shore before the tide was spent, and anchored in 10 fathom. St. George's Island bore N. E. by N. distant three leagues; a point of land, which we named Porpoise Point, N. by W. distant five miles, and the southernmost land S. by E. distant about two miles. In the evening we again got under sail, and steered S. by E. and at ten o'clock we anchored about a mile from the north shore, in 13 fathoms. Sandy Point now bore S. by E. distant four miles; Porpoise Point N. N. W. three leagues, and St. George's Island N. E. four leagues. On the 24th, we sent the boat to sound between Elizabeth's and St. Bartholomew's Islands, and found it a very good channel, with deep water. On this occasion we saw a number of Indians, who hallooed to us from Elizabeth's Island. Both the men and women were of the middle size, well made, and with smooth black hair. Their complexion was olive-coloured, and their bodies were rubbed over with red earth, mixed with grease. They are very active and swift of foot. Their clothing consists of skins of seals, otters, and guanicoes, sewed together in a piece about four feet square, and wrapped round their bodies. They have likewise a cap made of the skins of fowls with the feathers on; and upon their feet were pieces of skins to answer the purpose of shoes: besides, some of the females had pieces of skin fastened round their waists. The women however had no caps, but wore a kind of necklace formed of shells. Several of the men had nothing wrapped round them, but were entirely naked. This day the Commodore, accompanied by his second lieutenant landed upon Sandy Point, where they found plenty of wood, with exceeding good water, and for four miles of their walk the shore was very pleasant. A fine level country is over the point, and the soil to all appearance is extremely rich. The ground was covered with different kinds of flowers, that perfumed the air with their fragrance, among which, where the blossoms had been shed, we saw berries innumerable, even the grafts was intermixed with peas in blossom. In this luxuriant herbage, a multitude of birds were feeding, which on account of their uncommon beautiful plumage, we called painted geese. In our walk from Sandy Point, which was more than 12 miles, we saw no part of the shore where a boat could land without great danger, the water being every where shoal, and the sea breaking very high.

In little recesses of the woods, and always near to fresh water, we discovered a great number of wigwags, belonging to the Indians, which had been very lately occupied, for in some of them the fires were scarcely extinguished. Plenty of wild celery, and a variety of plants, were seen in many places, the utility of which to seamen in a long voyage is well known. We returned in the evening to the ships, which we found at anchor in Sandy Bay, in 10 fathoms water, and at the distance of about half a mile from the shore. During our absence, some of our men were employed in hauling the seine, and in three hours had caught a great quantity of fish, of an extraordinary size; among which were sixty large mullets. A shooting party had good sport; for the place abounds with geese, teal, snipes, and other birds. This excellent food was, especially at this time, very acceptable, for the keen air of this place had made our people so hungry, that they could have eaten three times their allowance. By a good observation we found our latitude to be 53 deg. 10 min. S.

On Tuesday the 25th, being Christmas-day, we weighed at eight o'clock, A. M. and with little wind, steered S. by E. along-side of the shore between two and three miles, but had no sounding with a line of 40 fathoms. Every thing here was in the greatest perfection, with respect to the appearance of the trees, and the verdure of the lands, which in different places afford a most enchanting prospect; and many parts of the shore have pasture for sheep or cows, which in such long voyages are generally on board. At this time of the year, the sun is 17 hours above the horizon, these islands being situated nearly at the same distance from the equator, as the middle part of Great Britain, only one to the south, and the other to the north. In sailing towards the South Pole, the same alteration is found as in steering towards the north, till you run between 60 and 70 degrees, when the westerly winds generally prevailing in the southern ocean, and blowing very furiously in the months of April, May, June, July, August, and September, there is no probability of sailing round the cape in these months, for which reason ships seldom attempt it, unless in the proper season. At three P. M. we cast anchor in 18 fathoms water, Sandy Point bearing N N. W. three leagues, and the south point of Fresh Water Bay, S. E. half E. two miles. The tide here runs very slow, but rises considerably by the shore, where we observed it to flow 16 feet. The land here is diversified with woods, and abounds with water: in some places it rises very high, and is covered with perpetual snow. On the 26th we weighed, and steered S. S. E. for Port Famine. The northernmost point, called St. Anne's, at noon, bore S. by E. half E. distant three leagues. A reef of rocks runs out from this point S. E. by E. about two miles; and the water will suddenly shoal from 60 to 20 fathoms, at the distance of two cables length from the reef. The point itself is very steep, and care must be taken in standing into Port Famine, for the water shoals very suddenly, and at more than a mile from the shore there is but nine feet water, when the tide is out. Soundings will soon be got by hauling close round St. Anne's Point; but when there is no more than seven fathoms, it will not be safe to go farther in.

On Thursday the 27th, we anchored at noon in Port Famine. Our situation was extremely eligible, for we were sheltered from all winds, except the S. E. which seldom blows, and was a ship to be driven on shore in the bottom of the bay, she could not receive any damage, for it is all fine soft ground. In this harbour may be found a considerable quantity of excellent wood, either green or dry, the latter lying along the shore on both sides the straits, which are almost covered with the trees that have been blown down from the banks, and drifted by the high winds. These trees are somewhat like our birch, but are of so considerable a size, that the trunks of some of them are two feet and a half in diameter, and 60 feet in length. Many of these were cut down for our carpenter's use, who found, that when properly dried, they were very servicable, though not

fit for masts. As to drift wood, there is a quantity sufficient to have furnished a thousand sail.

Port Famine obtained its name from a party of Spaniards, who had planted a colony on the shore; but for want of a regular supply of provisions, were starved to death. There are still some remains of buildings, though they are now almost covered with earth. We saw them on a hill, that has been cleared of wood, and which is not far from where our ships lay. The river Sedger discharges itself into the bay. This river is about half a cable length broad at the entrance, and is just navigable for boats. In going into it we met with two flats, one on the starboard-side, and the other on the larboard, which we discovered at half ebb; these render it somewhat difficult to go up the river, except after half flood, when it may be navigated with great pleasure and ease, by keeping in the middle of the channel. About two miles up the river it is not above 30 yards over, at which place we found on our right, a fine gravelly steep beach, so that the boats had the convenience of coming along-side of it, in order to receive the water in casks, which we found to be excellent. The Commodore, with a party, went up the river four miles, but could proceed no farther, the trees which had fallen across the stream impeding the boat's way; one of the stumps of them having made a hole in her bottom, she was immediately filled with water; but, with difficulty they hauled her on shore, and contrived to stop the leak, so that they made a shift to return in her to the ship. This river has perhaps as beautiful an appearance as it is possible for the most luxuriant fancy to conceive. Its agreeable windings are various; and on each side is a fine grove of stately trees, whose lofty heads jut over the river; and form a pleasant shade. Some of them are of a great height, and more than eight feet in diameter, which is proportionably more than eight yards in circumference; so that four men joining hands could not compass them; among others, we saw the pepper-tree, or winter's-bark, in great plenty. To complete this delightful spot, the wild notes of different kind of birds are heard on all sides, and the aromatic smell of the various sorts of flowers which adorn its banks, seem to unite in gratifying the senses of the enchanted stranger. The flowers with which in many places the ground is covered, are not inferior to those that are commonly found in our gardens, either in beauty or fragrance. Such are the charms which nature has lavished on a spot, where the Indians alone can behold its beauties; while they are probably insensible of those attracting scenes, which persons of the most improved taste might contemplate with no small pleasure; and were it not for the severity of the cold in winter, this country, by cultivation, might be made the finest in the world. The leaves of the trees, the dimensions of whose trunks we have already noticed, resemble those of our bay-trees. The rind is grey on the outside and pretty thick. This is the true winter's bark, a name which it obtained from its being brought in the year 1567, from the Straits of Magellan, by Mr. William Winter. This bark, on being taken off the tree and dried, turns to the colour of chocolate. It has an acrid, burning, pungent taste, and is esteemed an excellent remedy against the scurvy. It is, however, extremely fragrant, and the tree, when standing, has a strong aromatic smell. We frequently made use of the bark on board our ship in pies, instead of pepper, and being steeped in water it gives a very agreeable flavour. These trees are likewise found in the woods, in many other places in the straits, and also on the east and west coasts of Patagonia. The land in the woods, in some places, consists of gravel, in others of sand, and in others of good brown earth; but old fallen trees and underwood obstruct the passage through them. These woods near the shore, extend up the sides of very high hills, but the mountains further within land rise much higher, and their barren rugged summits covered with snow, are seen peeping over the hills next the shore. Indeed, the land on each side the shore rises to a great height, particularly on the island of Terra del Fuego, on the south-side of the

straits, where there are high barren rocks covered with everlasting snow. These have a black dreary aspect, and must have a considerable influence on the air, which they render cold and moist. This evidently appeared even while we were there, though this was their midsummer, when every thing must naturally be in the highest perfection. But notwithstanding the weather, when the sun shone out, was very warm, yet it was unsettled, and we had frequently heavy rain and thick fogs. In the woods are innumerable parrots, and other birds of the most beautiful plumage. We shot every day geese and ducks enough to serve the Commodore's table, and that of several others: we had, indeed, plenty of fresh provisions of all kinds, particularly fish, of which we caught such numbers as supplied our men three times a week. We must not omit here, that we saw many Indian huts, built with small branches of trees, and covered with leaves and mud, but we never met with a single inhabitant. The country between this and Cape Forward, which is distant about three leagues, is exceeding fine: the soil appears to be very rich, and there are no less than three pretty large rivers, besides many brooks. While we continued in this port, the Commodore and a party went one day to Cape Forward. Upon setting out we intended to have gone farther; but the rain having fell very heavy, we were glad to stop at the Cape, and make a good fire to dry our clothes. The Indians had de-

parted so lately from this place, that the wood, which lay half burnt, was still warm. Soon after our fire was kindled, we perceived another on the Terra del Fuego shore, a signal, probably, which we did not understand. The rain having abated, we walked over the cape, and found the strait to run about W. N. W. The hills as far as we could see, were of an immense height, very craggy, and covered with snow from the very base upwards. The Commodore having ordered a tent to be erected on the borders of a wood, and near a rivulet, three seamen were stationed there to wash linen, and they lay in the tent. One evening, soon after they had retired to rest, they were awakened by the deep and hollow roarings of some wild beasts, which approached nearer every moment. Terrified with apprehensions of being devoured, they made and kept up a blazing fire, round which the beasts walked at a small distance till dawn of day, when they retired. We did not credit this story, for the relators could not tell us what kind of beasts they saw, only they were very large; yet it must be acknowledged, that, at different times, when on shore, we tracked many wild beasts in the sand, but never saw one. And as we were returning through the woods, we found two very large skulls, which, by the teeth, appeared to have belonged to some beasts of prey, but of what kind we could not guess.

C H A P. II.

The Dolphin and Tamar steer back from Port Famine in search of Falkland's Islands—Arrive at Port Egmont—Observations on this port and the adjacent country—Run from Falkland's Islands to Port Desire, and through the Straits of Magellan as far as Cape Monday—The Florida storeship happily discovered—A strange sail makes her appearance, and follows the Dolphin, which proved to be the Eagle, commanded by M. Bougainville—A description of different parts of the Straits—Passage from Cape Monday into the South Sea—The Dolphin in a critical situation—Observations on Tuesday Bay—Enters the Pacific Ocean—And touches at Mafu-Fuero—Observations on this Island.

A. D. 1765. **W**E began this New-year in Port Famine, where we enjoyed every blessing, which after so long a voyage we had reason to expect. We had fish, wood, and water, in abundance: both our ship and the Tamar were in good condition, and the success of our voyage, with the continued kindness of our Commodore, kept our men in high spirits. Having completed the wood and water of both ships, and provided every necessary that was wanted, on Friday the 4th of January, we weighed, and set sail from Port Famine, standing over to the Island of Terra del Fuego, where we saw great quantities of smoke rising from different quarters, which we supposed to be raised by various parties of Indians. The intention of the Commodore was now to steer back again in search of Falkland's Islands. With this view on the 5th, we held on our course N. W. by N. four leagues, and then three leagues north, between Elizabeth and Bartholomew Islands, after which we steered N. E. half E. from the second narrow to the first, being a run of eight leagues. We proceeded through the first narrow against the flood; but the tide of flood setting strong to southward, drove the ship directly towards the south shore, which might have proved of fatal consequence to the ship; for as we were under a very high rocky cliff in 50 fathoms water, if there had happened a sudden squall of wind, we must have been inevitably lost: however, the flood set us back again into the entrance of the first narrow, and we cast anchor in 40 fathom, within two cables length of the shore. On the 6th, at one o'clock, A. M. we weighed, and had a pleasant northerly breeze with the tide of ebb; but this breeze soon abating, the tide set the ship to the N. W. and at five she took the ground on a sand bank of 15 feet, which reduced us to no small extremity; but providentially, in about half an hour, she swung by the force of the tide into deeper water. This shoal, not mentioned by any former navigators,

is very dangerous, as it lies directly in the track between Cape Virgin Mary and the first narrow, and just in the middle between the north and south shores. It is more than two leagues long, equally broad, and in many places very steep; so that should a ship ground upon it in a hard gale of wind, she would probably soon be beat to pieces. When we were upon this bank, Point Possession bore N. E. distant three leagues, and the entrance of the narrow S. W. distant two leagues. About six o'clock, A. M. we anchored, and at noon worked with the ebb tide till two, but finding the water shoal, we came again to anchor, about half a mile from the south-side of the bank: at which time the Asses Ears bore N. W. by W. distant four leagues. On the 7th, about eight o'clock, A. M. we weighed and steered about half a mile S. E. by E. We now got our boats out, and towed the ship into the deepest water in the fourth channel; by which means we anchored in 14 fathoms, the tide of flood making strong against us; and then being for the distance of half a mile round us encompassed with shoals, that had only eight feet water, we sent our boat to sound, in order to find a channel; and after being disappointed more than once, we at length weighed for the last time, and left the coast.

On Tuesday the 8th, by observation we found ourselves in latitude 51 deg. 50 min. We now brought to for the Tamar, who had come through the north channel, and was some leagues astern of us. This day we had strong gales from the westward: and in the forenoon a most violent squall of wind which sprung our main-mast, but effectual methods were taken immediately by our carpenter to secure it. On the 9th, we were in latitude 52 deg. 8 min. S. and in 68 deg. 31 min. W. longitude, at which time Cape Virgin Mary bore S. 83 deg. W. distant 33 leagues. On the 10th, our course was N. 18 W. for 13 leagues; and our latitude 51 deg. 31 min. S. longitude 68 deg. 44 min.

44 min. W. On the 11th, our course was N. 87 E. for 33 leagues. Cape Virgin Mary bore S. 73 deg. 8 min. W. and Cape Fairweather W. 2 deg. S. This day we had strong gales at S. W. accompanied with a great sea. In the evening we espied land, but our comfort being some leagues after, we wore ship, and made an easy sail off. On the 12th, at day break, we stood in again, and at four o'clock recovered sight of the land a-head, which was taken for De Werts Islands, and at the same time we saw other land to the south, which appeared to be a considerable number of islands near each other, some of them seeming very low, and almost even with the surface of the water, and which we judged to be what are called in the charts New Islands. Intending to stand in between these, we found the land which appeared to be unconnected, was joined by some low ground, and formed a deep bay. When hauling out of this we discovered a long low reef of rocks, stretching out for more than a league to the northward of us, and another between that, and what we had taken for the northernmost of De Werts Islands. This land consists chiefly of mountainous and barren rocks, except the low part, which is not seen till you approach near it, and the whole has very much the appearance of Staten Land. Birds and seals abound here, and we saw large whales spouting round the ship. When we were near enough to discern the low land, we found ourselves wholly embayed, and had it blown hard at S. W. so high a sea must have rolled in, as would have made it impossible to keep clear of the shore; we mention these particulars, that all ships may hereafter avoid falling into this bay. At noon we observed in latitude 51 deg. 27 min. S. and in 63 deg. 54 min. W. longitude.

On Sunday the 13th of January, at day-break, we stood in for the north part of the island by the coast of which we had been embayed. Being about a league to the eastward, it fell calm, and poured down torrents of rain, after which a most uncommon swell came from the westward, and ran so high, and with such velocity, that we expected every moment it would set us very fast towards the shore, as dangerous as any in the world, and we could see the surge breaking at some distance from it mountains high; very fortunately for us a fresh gale sprung up at S. E. with which, to our great joy, we were able to stand off, and we would advise every one, who may hereafter come this way, to give the north part of this island a good berth. We now brought to in latitude 51 deg. S. and in 63 deg. 22 min. W. longitude.

Monday the 14th, we discovered a flat island covered with tufts of grass as large as bushes. We continued our course along the shore six leagues farther, and then saw a low rocky island, bearing S. E. by E. and distant about three leagues from the land we were coasting, which here forms a very deep bay, and bears E. by N. of the other island on which had been seen the long tufts of grass. During the night we stood off and on, and on the 15th, at three o'clock, A. M. we stood in towards the land, and hoisted out our boats to sound. These were gone till noon, when they returned with the agreeable news of having found a fine convenient bay, entirely secure from the fury of the winds, with its entrance lying to the northward. The land is on each side very high, and the entrance, which is half a mile broad, not in the least dangerous, there being nothing to obstruct the passage, and the depth is from seven to 13 fathoms, with soft muddy ground. The shore of this bay is not encompassed with sunken rocks or sands; nor is there the least danger in approaching it. In passing on the starboard-side, many fine small bays and harbours open to the view, and to the third of these, which we entered, and found of great extent, the name was given of Port Egmont, in honour of the right honourable the earl of Egmont, first lord of the Admiralty, under whose direction this voyage was principally undertaken. The mouth of it is S. E. distant seven leagues from the low rocky island, which is a good mark to know it by. At the distance of about two miles from the shore, there is about eighteen

fathoms water; and about three leagues to the westward of the harbour, there is a remarkable white sandy beach, off which a ship may anchor till there is an opportunity to run in. We moored in 10 fathoms, with fine holding ground. This harbour is so commodious, that we think it proper to give a particular description of that and the adjacent country.

Port Egmont is surrounded by a range of islands, perfectly disjointed, and each placed in a convenient and agreeable situation. There are three different passages into this port, one from the S. W. another from the N. E. and the third from the S. E. and this last we found capable of receiving a ship of the greatest burthen. This harbour is of such capacity, as to be able to contain the whole royal navy of England, which might lie here in perfect security. As the adjacent country has all the requisites for a good settlement, it is probable, that was it added to the crown of Great Britain, it would in time become a most flourishing spot. There are here many cascades of water, which are so conveniently situated, that by bringing casks along-side the shore, many of them may be filled at once. One inconvenience, however, attends this place, which is that there are no trees; but this is of small consequence; for in the proper season of the year, young trees might easily be brought through the straits to these islands, where there is no doubt but they would grow and prosper. On our first arrival we sowed the seeds of turnips, radishes, lettuces, &c. and before we left the harbour many of them began to spring up very fast, and we have since heard, that some persons who arrived here after our departure, eat of those roots and salad. It must however be acknowledged, that the wheat which we also sowed, being put into the ground at an improper season, though it sprang up, did not come to perfection. This we learnt from a person who lately came from hence in one of his Majesty's ships of war. The pasture ground of this island is so rich, that the grass rose as high as our breasts, which rendered our walking rather troublesome. We cut down great quantities of it for the use of our sheep. It is not to be doubted, but that was this country to be properly examined, many valuable discoveries might be made with respect to its vegetables and minerals; for upon a slight survey of the hills, we found a kind of iron ore, and have some reason to believe, that if an exact scrutiny was made, other ores might be found of greater value. On our first going on shore, the water side was entirely covered on every side with different kinds of birds, of very beautiful colours, and so tame, that in less than half an hour we knocked down as many as we could conveniently carry away in our boats; particularly white and painted geese, a great number of penguins, cape hens, and other fowls. Those which we called painted geese, were nearly of the size of ours, only of a different colour, having a ring of green feathers on the body, and spots on different parts, with yellow legs. A stranger would scarcely forbear smiling at this time upon seeing our ship, for never was any shop in Leaden-hall-market so plentifully supplied with poultry, and the men in every part were busily employed in picking them. As by experience we found they had a strong taste from their feeding upon sea-weeds, small fish, and particularly limpets, of which there are great plenty as large as oysters, we found out a new method of dressing them, which rendered even these fowls extremely palatable; so that we had as much provisions, and of the nicest sorts, as we could desire. The method we pursued, was by cutting them into pieces over night, and letting them lie in salt-water till the next day, and after being thus purged by lying in soak, we made them, with a sufficient quantity of flour, into pies. Besides these fowls, we met with a prodigious quantity of ducks, snipes, teal, plover, small birds, and fresh-water geese, which last, living entirely by the fresh ponds, have a most delicious taste, and are not inferior to those we are accustomed to eat in England. They are entirely white except their legs. We frequently sent two of our men in search of them, who were sure to bring home half a dozen, or more, which they found a sufficient load, being not a little encumbered

cumbered by the height of the grafs. We found also a great number of feals, fome of them very large, and feveral men were employed on shore, at a place we called Blubber's Bay, from the number of thofe animals we killed, for their oil: for when boiled they yielded a fufficient quantity of it for the fhips companies to burn in lamps, while the men preferved their fkins for waift-coats, and other ufes. We were not furprifed at meeting with fuch a great number of feals, when we afterwards found that they had fometimes 18 or more, at a litter. Sea-lions of a prodigious fize are alfo found on the coaft. The Commodore was once unexpectedly attacked by one of thefe, and extricated himfelf from the impending danger with great difficulty. We had many battles with this amphibious animal, the killing one of which was frequently an hour's work for fix men: one of them almoft tore to pieces the Commodore's maffiff dog by a fingle bite. The maffer having been fent to found the coaft, four very fierce animals ran after the boat's crew till they were up to the middle in water, and having no fire-arms, they were obliged to put off from the shore. The next day the Commodore and his party faw a fea-lion of an enormous fize, and the crew being well armed infantly engaged him. While they were thus employed, one of the other animals poffed towards them; but a ball being infantly lodged in his body, he was foon difpatched. Five of thefe creatures were killed in their attempts to feize the men, whom they always purfued the moment they got fight of them. They were of a mixed fhape, between a wolf and a fox, moft like the latter, but of the fize of the former. They burrow in the ground like a fox, feed on feals and penguins, and are very numerous on the coaft. The failors, in order to be rid of fuch disagreeable intruders, fet fire to the grafs, which burnt fo rapidly, that the country was all in a blaze for a few days, and thefe animals were feen running to feek fhelter from the fury of the flames. On the north-fide of this harbour is the principal ifland, to which we frequently went on shore, on account of its fituation, and the fine profpect it afforded from a prodigious high hill, which cannot be afcended without difficulty; but on gaining the fummit, the great fatigue of afcending it, is fully recompenced, by the delightful view it commands of the fhips at anchor, with every part of the harbour; of the three paffages into Port Egmont, the fea which furrounds you on every fide; and all the adjacent iflands, which are upwards of fifty, fmall and great, all of which appeared covered with verdure. While we lay in this harbour the crew breakfafted on portable-foup and wild celery, thickned with oatmeal, which made a very nutritive mefs.

On Wednesday the 23d, the Commodore, with the Captains of the Dolphin and Tamar, and the principal officers went on shore, where the Union Jack being erected on a high ftaff, and fpread, the Commodore took poffeffion of this harbour, and all the neighbouring iflands, for his Majefty king George the third, his heirs and fucceffors, by the name of Falkland's Iflands. The colours were no fooner fpread, than a falute was fired from the fhip. Our feamen were very merry on the occafion, a large bowl of arrack punch being carried on shore, out of which they drank, among many other toaft, Succefs to the difcovery of fo fine a harbour. It was the opinion of the honourable Commodore Byron, that thefe iflands, are the fame land to which Cowley gave the name of Pepys's Ifland, and as the Commodore feems not to entertain a doubt in his own mind, we fhall lay before our readers, the reasons he has been pleafed to give the public in fupport of his opinion.

"In the printed account of Cowley's voyage" (obferves Commodore Byron) he fays, "We held our courfe S. W. till we came into the latitude of 47 deg. where we faw land, the fame being an ifland, not before known, lying to the weftward of us: it was not inhabited, and I gave it the name of Pepys's Ifland. We found it a very commodious place for fhips to water at, and take in wood, and it has a very good harbour, where a thoufand fail of fhips may fafely ride. Here is great

plenty of fowls, and, we judge, abundance of fifh, by reafon of the grounds being nothing but rocks and fands." To this account there is annexed a representation of Pepys's Ifland, in which names are given to feveral points and head lands, and the harbour is called Admiralty Bay; yet it appears that Cowley had only a diftant view of it, for he immediately adds, "the wind being fo extraordinary high that we could not get into it to water, we flood to the fouthward, faping our courfe S. S. W. till we came into the latitude of 53 deg." and though he fays, that "it was commodious to take in wood," and it is known that there is no wood on Falkland's Iflands, Pepys's Ifland and Falkland's Ifland may, notwithstanding, be the fame; for upon Falkland's Iflands there are immense quantities of flags with narrow leaves, reeds, and rufhes, which grow in clufters, fo as to form bufhes about three feet high, and then fhoot about fix or feven feet higher: thefe at a diftance have greatly the appearance of wood, and were taken for wood by the French who landed there in the year 1764, as appears by Pernetty's account of their voyage. It has been fuggelted, that the latitude of Pepys's Ifland might, in the manufcript from which the account of Cowley's voyage was printed, be expreffed in figures, which if ill made, might equally relemble 47 and 51; and therefore as there is no ifland in thefe feas in latitude 47, and as Falkland's Iflands lie nearly in 51, that 51 might reasonably be concluded to be the number for which the figures were intended to ftand: recourfe therefore was had to the British Mufeum, and a manufcript journal of Cowley's was there found. In this manufcript no mention is made of an ifland not before known, to which he gave the name of Pepys's Ifland, but land is mentioned in latitude 47 deg. 40 min. expreffed in words at length, which exactly answers to the defcription of what is called Pepys's Ifland in the printed account; and which here, he fays, he fuppofed to be the Iflands of Sebald de Wert. This part of the manufcript is in the following words: "January 1683, This month wee were in the latitude of 47 deg. and 40 min. where weefpied an ifland bearing weft from us, wee having the wind at N. E. wee bore away for it, it being too late for us to goe on fhore, weelay by all night. The ifland feemed very pleafant to the eye, with many woods, I may as well fay, the whole land was woods. There being a rock lying above water to the eaftward of it, where were an innnumerable company of fowles, being of the bigneffe of a finall goofe, which fowles would ftrike at our men as they were aloft: fome of them wee killed and eat: they feemed to us very good, only taffed fomewhat fifhly. I failed along that ifland to the fouthward, and about the S. W. fide of the ifland there feemed to me to be a good place for fhips to ride; I would have had the boat out to have gone into the harbour, but the wind blew frefh, and they would not agree to go with it. Sailing a little further, keeping the lead, and having 26 and 27 fathoms water, until wee came to a place, where weefaw the weeds ride, having the lead againe found but feaven fathoms water. Fearing danger went about the fhipp there, were then fearefull to ftay by the land any longer, it being all rocky ground, but the harbour feemed to be a good place for fhips to ride there; in the ifland feeming likewife to have water enough; there feemed to me to be harbour for 500 fail of fhips. The going in but narrow, and the north-fide of the entrance fhallow water that I could fee, but I verily believe that there is water enough for any fhipp to goe in on the fouth-fide, for there cannot be fo great a lack of water, but muft needs fcowre a channell away at the ebbe deepe enough for fhipping to goe in. I would have had them flood upon a wind all night, but they told me they were not come out to go upon difcovery. Wee faw likewife another ifland by this that night, which made me think them the Sibble D'wards. The fame night we fteered our courfe againe W. S. W. which was but our S. W. the compaffe having two and twenty degrees variation eaftwardly, keeping that courfe till we came in the latitude of three and fifty degrees."

In both the printed and manufcript account, this land is faid to lie in latitude forty-feven, to be
situated

situated to the westward of the ship when first discovered, to appear woody, to have an harbour where a great number of ships might ride in safety, and to be frequented by innumerable birds. It appears also by both accounts, that the weather prevented his going on shore, and that he steered from it west-south-west, till he came into latitude fifty-three: there can therefore be little doubt but that Cowley gave the name of Pepys's island after he came home, to what he really supposed to be the island of Sebald de Wert, for which it is not difficult to assign several reasons; and though the supposition of a mistake of the figures does not appear to be well grounded, yet, there being no land in forty-seven, the evidence that what Cowley saw was Falkland's islands, is very strong. The description of the country agrees in almost every particular, and even the map is of the same general figure, with a strait running up the middle. The two principal islands have been probably called Falkland's islands by Strong, about the year 1689, as he is known to have given the name of Falkland's sound to part of the strait which divides them. The journal of this navigator is still unprinted in the British Museum. The first who saw these islands is supposed to be Captain Davies, the associate of Cavendish in 1692. In 1594, Sir Richard Hawkins saw land, supposed to be the same, and in honour of his mistress, Queen Elizabeth, called them Hawkins's Maiden Land. Long afterwards they were seen by some French ships from St. Maloes, and Frezier, probably for that reason, called them the Malouins, a name which has been since adopted by the Spaniards." So much for the dispute concerning the discovery of these celebrated islands, which the Spaniards now enjoy unmolested, while to England only remains the empty honour of having discovered, explored, and given them a name.

We had now completed our watering, surveyed the harbour of Port Egmont, and provided every necessary for our departure. This evening the smith came on board, he having been employed on shore, in making and repairing iron work for the use of the ship. We continued in the harbour till Sunday the 27th, when, at eight o'clock, A. M. we left Port Egmont, and sailed with the wind at south-south-west. But we were scarcely out at sea, when it began to blow hard, and the weather became so extremely hazy, that we could not see the rocky islands. We now most heartily wished to be safe anchored in Egmont harbour; but, contrary to our expectations, in a short time the weather cleared up, though it blew a hard gale all the day. At ten o'clock, after having run along the shore east, about five leagues, we saw a remarkable head-land, which was named Cape Tamar. Five leagues farther we passed a rock, and called it Edystone. We now sailed between this and another head-land, to which was given the name of Cape Dolphin, in the direction of east-north-east, five leagues farther. The distance from Cape Tamar to Cape Dolphin, is about eight leagues, and from its having the appearance of a sound, it was called Carlisle Sound, though it is since known to be the northern entrance of the strait between the two principal islands. We steered from Cape Dolphin along the shore east, half north, to a low flat cape, or head-land, and then brought to. During the course of this day, the land we saw was all downs, having neither trees nor bushes, but large tufts of grass in various places. It may not be improper here to take notice, that as in most of the charts of Patagonia, an island is described by the name of Pepys's island, as hath already been mentioned, where travellers have asserted, that they have seen trees in abundance, and many hills of water; but that after several attempts in the latitude where it was said to be discovered, no island nor any founding could be found; in justice to the pretended discoverers of that and other imaginary islands, we here beg leave again to observe, that they probably had no intention to deceive, for on this coast, where you meet with frequent gales of wind, and thick foggy weather, we found the banks of fogs were apt to deceive even an accurate observer, and make him mistake them for land. Thus we ourselves have frequently

imagined, that we saw land very near; but suddenly a breeze of wind springing up, our supposed land disappeared, though we did not think ourselves above a league and a half from it, and convinced us of our mistake by opening to our view an unbounded prospect. So easily does the mind of man, when set on one particular object, form to itself chimerical notions of its darling pursuit, and when harrassed, as we will suppose, by the distresses that frequently attend an enterprize of this nature, make an imaginary discovery of land, where nothing but a thick fog, and a vast extent of sea, are to be found.

On Monday the 28th, at four o'clock, A. M. we made sail, and steered east-south-east, and south-south-east to two low rocky islands, about a mile from the main; and to a deep sound between these, we gave the name of Berkley's Sound. About four miles to the southward of the south point of this sound, the sea breaks very high, on some rocks that appear above water. The coast now wore a dangerous aspect; rocks and breakers being at a considerable distance from the shore, and in all directions, and the country appeared barren and desolate, much resembling that part of Terra del Fuego which lies near Cape Horn. The sea rising here very high, we tacked and stood to the northward, to prevent our being driven on a lee shore. Having now run no less than seventy leagues of this island, we concluded, it must be of considerable extent. Some former navigators have made Falkland's islands, to be about two hundred miles in circumference, but in the opinion of our Commodore, they are near 700 miles. At noon we hauled the wind and stood to the northward, the entrance of Berkley's Sound bearing at three o'clock, S. W. by W. six leagues off; and in the evening we stood to the westward, the wind having shifted to the S. W. On Tuesday, the 5th of February, at one o'clock P. M. we again made the coast of Patagonia, bearing S. W. by S. six leagues distant. At two we passed by Penguin Island; and at three standing towards the harbour of Port Desire, which was two leagues distant, we to our great satisfaction, discovered the Flora storeship, which had been fitted out at Deptford, and had on board a great quantity of new baked bread, packed in new casks, besides brandy, flour, beef, and all such necessary provisions and stores for the use of our two ships. This vessel, whose arrival was so opportune for the prosecution of our voyage, was dispatched by the lords of the Admiralty, with as much secrecy as the Dolphin, with respect to the ignorance of the men on board as to their place of destination. When she first sailed from Deptford, she was fitted out for Florida; nor did the master know, till he arrived southward of the line, that he was ordered to recruit the Commodore's vessels. We had for some time past been uneasy, concluding that this ship had probably met with some accident that had obliged her to return: but her appearance agreeably removed all the anxiety we had felt from this groundless conjecture; and indeed it was very happy for us, that we fell in with her at this juncture, which was the more seasonable, as for some time we had been reduced to a short allowance of certain articles of provisions, which she was able to supply us with; but had this not been the case, a worse consequence must have ensued, namely, that of being obliged to steer to the Cape of Good Hope, in order to purchase provisions, and consequently losing our voyage; as by this delay it would be too late for us to attempt a passage into the South Sea, either by passing the straits of Magellan, or doubling Cape Horn, consequently an end would be put to all our discoveries, and the expence of fitting us out be thrown away. At four o'clock P. M. having anchored in Port Desire, the master of the storeship came on board the Dolphin, bringing a packet from the lords of the Admiralty to the Commodore. This person was a midshipman in his Majesty's service, and was to have a commission as soon as he found the Commodore. He had been several days in search of Pepys's Island; but was like us obliged to desist, and having crossed the latitude in which it was supposed to lie, had met with a storm that had greatly damaged his masts and sails. In the evening

ing the master of the Florida left the Dolphin, and by order of the Commodore, our carpenters attended him on board his own ship, to repair the damages she had sustained. During our run from Falkland's islands to Port Desire, the number of whales about the Dolphin rendered our navigation dangerous. One blew the water upon our quarter deck, and we were near striking upon another; they were of an uncommon size, much larger than any we had yet seen.

On Thursday the 7th, the night proved very tempestuous; when both the Tamar and Florida made signals of distress, having been driven from their moorings up the harbour. They were got clear of the shore with great difficulty, as they were the next night, when they both drove again. Finding the store-ship was in constant danger of being lost, the design of unloading her in this harbour was given up, and the Commodore determined to take her with him into the strait. Capt. Mouat of the Tamar having also informed us, that his rudder was sprung, it was secured with iron clamps in the best manner he could, there being no timber to be found proper for making her a new one. Having by the thirteenth completed the repairs of our respective ships, we made ready to leave this port, as by the rapidity of the tide, the boats could have little or no communication with the store-ship: it was therefore resolved to sail back to the Eastward, and take in our stores at one of the Ports we had before visited. One of our petty officers, well acquainted with the strait, and four of our seamen, were put on board the Florida, to assist in navigating her, and she was ordered to make the best of her way to Port Famine. On the 14th, we put to sea, and when, a few hours after, abreast of Penguin island, we got sight of the store-ship a long way to the eastward. On Saturday the 16th, about six o'clock, A. M. Cape Fairweather bore W. S. W. distant five leagues; and on the 17th, we hauled in for the strait of Magellan, and at six o'clock A. M. Cape Virgin Mary bore S. distant five miles. On the 18th, we passed the first narrow. To our great surprise, in the morning of the second day after we left Port Desire, we discovered a strange sail, which our Commodore apprehended might be a Spanish man of war of the line, who was come to intercept us; and in consequence of that surmise, boldly gave orders, that all on board the Dolphin and Tamar should prepare to give her a warm reception, by firing all our guns, and then boarding her from both ships: but while we were bringing to and waiting for her, it grew dark, and we lost sight of her, till the next morning, when we saw her at three leagues distance, and found she still followed us, while we sailed towards Point Famine. She even came to an anchor when we did. We were now employed in getting up our guns, having only four upon deck, which had been used for signals, the rest having for a considerable time before lain in the hold. We soon however got fourteen upon deck, and then came to an anchor, having the Tamar a-stern, with a spring on our cable; and that we might give her as warm a reception as possible, we removed all our guns to one side, pointing to the place where the vessel must pass. While we were thus busily employed in taking all the measures prudence could suggest to defend us from an imaginary danger, an accident that happened to the store-ship shewed that we had nothing to fear, and that the vessel against which we were arming ourselves, ought not to be considered as an enemy; for while the Florida was working to the windward, she took the shore, on a bank about two leagues from our ship. About the same time the strange vessel came up with her, and seeing her distressed cast anchor; and immediately began to hoist out her boats to give her assistance; but before they had reached the store-ship, our boats had boarded her, and the commanding officer had received orders not to let them come on board; but to thank them in the politest manner for their intended assistance. These orders were punctually obeyed, and with the aid of our boats only, the store-ship was soon after got into deep water. Our people reported, that the French vessel was full of men, and seemed to have a great many officers. At

six o'clock in the evening, we worked through the second narrow; and at ten passed the west end of it. We anchored at eleven off Elizabeth Island, and the French ship did the same, in a bad situation, southward of St. Bartholomew's Island, whereby we were convinced she was not well acquainted with the channel.

On Tuesday the 19th we weighed, and at six o'clock, A. M. we steered between Elizabeth and Bartholomew Islands, S. S. W. five miles, when we crossed a bank, where among the weeds we had seven fathoms water. This bank is situated W. S. W. about five miles from the middle of George's Island. To avoid danger, it is necessary to keep near Elizabeth's Island, till the western-shore is but a short distance, and then a southern course may be sailed with great safety, till the reef, which lies about four miles to the northward of St. Anne's Point, is in sight. The Frenchman still followed us, and we thought she came from Falkland's Islands, where is a French settlement, to take in wood, or that she was on a survey of the Strait of Magellan, in which we were now sailing. On the 20th, we hoisted out our boats, and towed round St. Anne's Point into Port Famine. Here we anchored, at six in the evening, and soon after the French ship passed by us to the southward. During our stay in this port, we were principally employed, in receiving provisions from the store-ship, and in completing our wood and water. On the 25th, finding that both the ships had received as much stores and provisions as they could possibly stow, the Commodore sent home all the draughts of the places he had caused to be taken, by the store-ship, with express orders, that if they were in any danger of being boarded and examined by any foreign ships, their first care should be to throw the plans and packets into the sea. On taking leave of the Florida, our boatswain, and all that were sick on board the Dolphin and Tamar, obtained leave to return in her to England; the Commodore in the mean time, declaring openly to the crew in general, that if any of them were averse to proceeding on the voyage, they had free liberty to return; an offer which only one of our men accepted. We now with the Tamar sailed from Port Famine, intending to push through the strait before the season should be too far advanced. At noon we were three leagues distant from St. Anne's Point, which bore N. W. three or four miles from Point Shutup, which bore S. S. W. Point Shutup bears from St. Anne's Point, S. half E. and they are about four or five leagues asunder. Between these two points there is a flat-shoal, which runs from Port Famine before the river Sedger, and three miles to the southward. At three o'clock, P. M. we passed the French ship, which now anchored in a small cove. She had hauled close to the shore, and we could see large piles of wood cut down, and lying on each side of her. Upon our return to England, we learnt this ship was the Eagle, commanded by M. Bougainville, and that her business in the strait was, as the Commodore had conjectured, to cut wood for the French settlement in Falkland's Islands. From Cape Shutup to Cape Forward, the course is S. W. by S. distance seven leagues. At eight in the evening we brought to, Cape Forward bearing N. W. half W. distant about a mile. This part of the strait is eight miles over, and off the cape we had 40 fathoms within half a cable's length of the shore.

On the 26th, at four o'clock, A. M. we made sail, and at ten we kept working to windward, looking out at the same time for an anchoring-place, and endeavouring to reach a bay about two leagues to the westward of Cape Forward. An officer was sent into this bay to sound, who finding it fit for our purpose we entered it, and at six o'clock, P. M. anchored in nine fathoms water. On the 27th, at six o'clock, A. M. we continued our course through the strait, from Cape Holland to Cape Gallant. This cape is very high and steep, and between it and the former cape is a reach, three leagues over, called English Reach. Five miles south of Cape Gallant is Charles's Island, of which it is necessary to keep to the northward. We steered along the

the north shore, at the distance of about two miles. Eastward of Cape Holland is a spacious sandy bay, called Wood's Bay, in which there is good anchorage. The mountains on each side the strait are more desolate in appearance than any others in the world, except perhaps the Cordeliers, both being rude, craggy, steep, and covered from the bottom to their summits with snow. From Cape Gallant to Passage Point, distant about three leagues, the coast lies W. by N. by compass. Passage Point is the east point of Elizabeth's Bay, and is low land, off of which lies a rock. Between this and Cape Gallant are several islands, some very small; but the easternmost, Charles's Island, is six miles long: the next is called Monmouth's Island, and the westernmost, Ruperts Island: this lies S. by E. of Point Passage. These group of islands make the strait narrow: between Port Passage and Rupert's Island, it is not more than two miles over, and it is advisable for navigators to go to the northward of them all, keeping the north-shore on board.

On Wednesday the 27th, at six o'clock, P. M. we stood in for Elizabeth's Bay, and anchored in ten fathoms, good ground. In this bay there is a good rivulet of fresh water. On the 28th, we met with excessive gales from the W. N. W. which blew with such violence, that we were driven three leagues to the eastward, where we cast anchor on the top of a rock, in 13 fathoms and a half water, a cable's length from the bay; but soon after we parted, or rather started our stream anchor, and fell off the rock: it was very dark, and the ship still kept driving with her whole cable out, and was in the greatest danger of being lost; however, we let go both bowers in 17 fathoms water. The wind still continued to blow very hard, and the ship was so near the rocks, that the boats could but just keep clear of the surf off the shore: but that providence which had hitherto attended us, still continued to be our friend, and preserved us from impending destruction; for the next morning we hove in the cable of our stream anchor, both the flukes of which were broke; and being thus rendered useless, it was thrown overboard. We now with our gib and stay-sails ran out into 10 fathoms, till we were exactly in the situation from whence we had been driven, where we anchored with our best bower.

On Friday the 1st of March, at five o'clock, A. M. we weighed, attended with light gales and moderate weather. At seven passed Muske Bay, a league to the westward of Elizabeth's, on the southern shore. At eight we were two leagues W. by N. of this bay, and abreast of Bachelor's River, which is on the north shore. A league from hence lies the entrance of St. Jerom's Sound, which we passed at nine. In our course along this coast we saw a smoke, and soon after discovered a great number of Indians in detached parties, some of whom, on seeing us, put their canoes into the water, and made towards our ship. When within musket shot, they began a most hideous shouting, and we halloed, and waved our hands, as signals for them to come on board, which after having frequently repeated, they did. On entering the ship they surveyed it with no small signs of astonishment, as if they had never seen a vessel of the like kind before. These Indians were in general of a middling stature, and of a very brown complexion, with long black hair, that hung down to their shoulders. Their bodies were covered with the skin of some animals unknown to us; but many of the poor wretches had not a sufficient quantity to cover their nakedness. We trafficked with them, or rather gave them abundance of things, particularly cloaths, which they seemed to receive with thankfulness: they were also exceeding fond of the biscuit, which we distributed among them pretty freely, though they appeared rather unwilling to part with any thing in return. Some of these people had bows and arrows, made of such hard wood, that it seemed almost impervious; the bows were not only exceeding tough and smooth, but wrought with very curious workmanship; and the string was formed of a twisted gut. The arrows, which were about two feet long, were pointed with flint shaped like a harpoon,

and cut with as great nicety, as if they had been shaped by the most exact lapidary; and at the other end a feather was fixed to direct its flight. They have also javelins. These Indians seem to be very poor and perfectly harmless, coming forth to their respective employments at the dawn of day, and when the sun sets, retiring to their different habitations. They live almost entirely on fish, and particularly on limpets and muscles, the latter of which they have in great plenty, and much larger than those we met with in England. Their boats are but indifferently put together: they are made chiefly of the bark of trees, and are just big enough to hold one family: when they land, being very light, they haul them upon shore, out of the reach of the tide, and seem very careful in preserving them. In the structure of some of these boats no small degree of ingenuity is evident. They are formed of three pieces, one at the bottom, which serves for the keel and part of the sides, and is fashioned both within and without by means of fire; upon this are placed two upper pieces, one on each side, which are sewed together, and to the bottom part, like a seam sewed with a needle and thread. All their boats in general are very narrow, and each end formed alike, both sharp, and rising up a considerable height. These Indians are very dexterous in striking the fish from their canoes with their javelins, though they lie some feet under water. In these instances, they seem to shew the utmost extent of their ingenuity; for we found them incapable of understanding things the most obvious to their senses. On their first coming aboard, among the trinkets we gave them were some knives and scissars, and we tried to make them sensible of their use; but after our repeated endeavours, by shewing the manner of using them, they continued as insensible as at first, and could not learn to distinguish the blades from the handles. There are plenty of seals in this part of the straits, but we did not meet with many fowl, owing doubtless to the intense cold, nor did we find the woods infested with any kind of wild beasts. On sailing to the westward we found an irregular tide, which sometimes ran 18 hours to the eastward, and but six to the westward; at other times, when the westerly winds blew with any degree of strength, it would constantly run for several days to the east. At intervals we had hard gales of wind, and prodigious squalls from the high mountains, whose summits are covered with snow. The straits are here four leagues over, and it is difficult to get any anchorage, on account of the unevenness, and irregularity of the bottom, which in several places close to the shore has from 20 to 15 fathoms water, and in other parts no ground is to be found with a line of 150 fathoms. We now steered W. S. W. for Cape Quod. Between this and Elizabeth's Bay is a reach about four miles over, called Crooked Reach. In the evening of the 4th, we anchored abreast of Bachelor's River, in 14 fathoms. The entrance of the river bore N. by E. distant one mile, and the northernmost point of St. Jerom's Sound, W. N. W. distant three miles. About three quarters of a mile eastward of Bachelor's River lies a shoal, upon which there is not more than six feet water when the tide is out: it is distant about half a mile from the shore, and may be known by the weeds that are upon it. We here saw several Indians dispersed in different quarters, among whom we found a family which struck our attention. It was composed of a decrepid old man, his wife, two sons and a daughter. The latter appeared to have tolerable features, and an English face, which they seemed desirous of letting us know; they making a long harangue, not a syllable of which we understood, though we plainly perceived it was in relation to the woman, whose age did not exceed thirty, by their pointing first at her, and then at themselves. Various were the conjectures we formed in regard to this circumstance, though we all agreed that their signs plainly shewed that they offered her to us, as being of the same country. In one particular they appeared to be quite uncivilized, for when we came up to them, they were tearing to pieces and devouring raw fish. On the 5th, we sent the boats a-head to tow, but could not gain a bay on the north shore, which appeared to be an

an excellent harbour, fit to receive five or six sail; we were therefore obliged to cast anchor on a bank, with the stream anchor, Cape Quod bearing W. S. W. distant about six miles. An officer was now sent to look out for a harbour, but he did not succeed.

On Wednesday the 6th, we moored in a little bay opposite Cape Quod; and the Tamar, which could not work up so far, about six miles to the eastward of it. This part of the strait is only four miles over, and its aspect dreary and desolate beyond imagination, owing to the prodigious mountains on each side of it, which rise above the clouds, and are covered with perpetual snow.

On Thursday the 7th, at eight o'clock we weighed, and worked with the tide. At noon, Cape Quod bore E. by S. and Cape Monday, the westernmost land in sight on the south shore, W. by N. distant ten leagues. The tides here are very strong, and the ebb sets to the westward, with an irregularity for which it is very difficult to account. At one the Tamar anchored opposite Cape Quod, in the bay we had just left; and in the evening we anchored in a small bay on the north shore, five leagues to the westward of Cape Quod. The marks to know this bay are two large rocks that appear above water, and a low point, which makes the east part of the bay. The anchorage is between the two rocks, the easternmost bearing N. E. half E. distant about two cables length, and the westernmost, which is near the point, W. N. W. half W. at about the same distance: there is also a small rock which shows itself among the weeds at low water, and bears E. half N. distant about two cables length. Should there be more ships than two, they may anchor farther out in deeper water. We found in this part of the strait few birds of any kind, and but a small quantity of muscles along the shore; and though we sent out our boat into a bay to haul the seine, it returned without success, not any fish being to be found. However, we frequently found great quantities of red berries, somewhat resembling our cranberries, which being wholesome and refreshing proved of considerable service to the ship's company. They are about the size of an hazle nut, and the chief provisions of the Indians in these parts. On the 8th, we found abundance of shell-fish, but saw no traces of people. In the afternoon, the Commodore went up a deep lagoon under a rock, at the head of which was a fine fall of water, and on the east-side of it several small coves, calculated for the reception of ships of the greatest burthen. He returned with a boat load of very large muscles. On the 9th, we got under way, at seven o'clock, A. M. and at eight saw the Tamar very far astern. We now stood to the N. W. with a pleasant breeze at S. by E. but when abreast of Cape Monday Bay, the wind took us back, and continued from six o'clock to eight, at which time Cape Monday Bay bore E. half N. six leagues. On the 10th, at six o'clock, A. M. Cape Upright bore E. by S. distant three leagues. From Cape Monday to Cape Upright, which are both on the south shore, and distant from each other about five leagues, the course is W. by N. At ten a violent storm of wind came on, which was very near effecting our destruction; for it was very thick rainy weather, and we suddenly discovered funken rocks on our lee-bow, just appearing above the surface of the water, at the distance of about half a mile from us. We tacked immediately, and in half an hour it blew so hard, that we were obliged to bear up before the wind, and go in search of an harbour. We were soon after joined by the Tamar, who had been six or seven leagues to the eastward of us all night. At six in the evening we came to anchor in a bay, in 16 fathoms water; but the anchor falling from the bank into 50 fathoms, the ship almost drove on shore; happily the anchor closing with a rock brought us up. We now weighed, and on the 11th steered into a proper anchoring place, on a bank, where the Tamar was riding, entirely surrounded with high precipices, where we lay not more than two cables length from the shore. There is a basin at the bottom of this bay, within which is ten fathoms, and room enough for six or seven sail to lie in perfect

security. Having at this time heavy squalls of wind, attended with much rain, the Commodore, with a generosity that endeared him to the crew, distributed as much cloth among the sailors as would make all of them long waistcoats; a present highly acceptable at this season of the year, and the more so, as the officers and men, on leaving England, from their expecting to sail directly to India, had provided no thick clothing. And that no partiality might be shewn to those on board his own ship, he ordered a sufficient quantity for the use of Capt. Mouat's company in the Tamar.

On Tuesday the 12th, while we were employed in searching after wood and water, the Tamar's boat was sent to the westward, with an officer from both ships, to look for harbours on the southern shore. On the 14th, the boat returned with the agreeable news, that they had found several bays, particularly five between the ship's station and Cape Upright, where we might anchor in safety. When the Commodore heard this, in order to encourage his men in the discharge of their duty, he ordered a double allowance of brandy to be given to every one on board, which, with their warm fear-nought jackets, provided by government, proved both comfortable and salutary; for some hills, which, when we came first to this place, had no snow upon them, were now covered, and the winter of this dreary and inhospitable region seemed to have set in at once. Those in the boat, during their absence, were benighted, and obliged by distress of weather to land, and take shelter under a tent which they had taken with them. They saw a number of Indians employed on the shore, in cutting up a dead whale, which scented the place for some distance around, it being in a state of putrefaction. This they supposed was designed for food, seeing they cut it in large slices, and carried them away on their shoulders to another party at a distance, who seemed employed round a fire: however it is equally probable, that like the Greenlanders, they might be making oil for their lamps against the approaching severity of winter. One of the officers told us, that near Cape Upright some Indians had given him a dog, and that one of the women had offered him a child which was sucking at her breast, but for what purpose he could not say. How much soever by their appearance, and manner of life, these seemingly forlorn rational beings may be degraded in the eyes of Europeans, we ought not from this trifling incident, to attribute to them such a strange depravity of nature as makes them destitute of affection for their offspring; or even to think that it can be surmounted by the necessities or wants attending the most deplorable situation; a notoriety of facts and universal history are against even a supposition of this kind. On the 15th, at eight o'clock, A. M. we made sail, and in the afternoon we anchored on the east-side of Cape Monday, in Wash Pot Bay. The pitch of the cape bore N. W. distant half a mile, and the extreme points of the bay from E. to N. by W. The newest shore was a low island between us and the cape, from which island we lay about half a cable's length. We had at this place frequent showers of rain and hail, with the air all the time excessive sharp.

On Saturday the 16th, at six o'clock, A. M. we unmoored, and at eight a strong current set us to the eastward. In this perplexing situation we were driven about from place to place, losing perhaps in a few hours, what we had been six days and nights working to the westward; for when the wind continues with violence there is no regular tide; but on the contrary, a constant westerly current running two miles an hour. Perceiving we lost ground, we came to an anchor, but finding the ground to be rocky we weighed again; and every man on board the rest of the day, and the whole night, continued on deck, during which time the rain poured down in unremitting torrents. Notwithstanding this incessant labour, on the 17th, we had the mortification to find we had been losing way on every tack, and at nine o'clock, A. M. we were glad to anchor in the very bay we had left two days before. It continued to rain, and blow violently for two days longer, so that we began to think, without a favourable wind,

wind, it would be our ill fortune to spend the winter quarter in one of these coves. The Commodore had sent out a boat to sound the bay on the north shore, but no anchorage could be found. On the 21st, we set sail, the wind veering from S. W. by W. to N. N. W. we worked to windward with continual squalls, which at intervals obliged us to clue all our sails. In the mean while the Tamar, whom till this time we had never lost sight of, by a favourable breeze, got a few leagues to the westward, where she lay two days in good anchorage. Harrassed as we were by continual disappointments, to add still more to our vexation and concern, we found our men were attacked by the scurvy, which had made its appearance on many of them; however, by the assistance of vegetables, and the extraordinary care of the Commodore, who caused portable soup to be served to the sick, and twice a week to the whole ship's company, on Fridays with pease, and on Mondays with oatmeal; and who with the greatest humanity never spared to distribute from his own table, whatever might be of use for the recovery of those attacked by this dreadful disorder, it was prevented from raging with any great inveteracy. On the 22d, to our great joy we made way, the current setting to the westward. At six in the evening, we anchored in a commodious bay on the east-side of Cape Monday, where the Tamar lay in 18 fathoms. We found this place very safe, the ground being excellent. It is remarkable, that notwithstanding the late severity of the weather, added to their incessant labour, the crew of both ships, in general, retained both health and spirits.

On Saturday the 23d, at eight o'clock, A. M. we again set sail, and in a few hours opened the South Sea, which rolled in with a prodigious swell. At four in the afternoon, we anchored about a league to the eastward of Cape Upright, in a good bay, with a deep sound at the bottom, by which it may be known. On the 24th, the boat was sent to the westward, with the second lieutenant, in search of an harbour, at which time we had continued rains, and cold unhealthy weather, with strong gales from the N. W. At six in the evening the boat returned without having been able to get round Cape Upright. On the 25th, the boat was sent again with arms, and a week's provisions, besides materials for erecting a tent, in case they should land, and find it necessary to make use of it. In the evening they returned, having been about four leagues, and had found two anchoring places, neither of them very good; upon which we weighed, and on the 26th, stood to the N. W. to windward of Cape Monday. The straits here are four or five leagues over, and the mountains seemed to be ten times as high as the mast head of our ship, but not much covered with snow. We continued under sail, till the wind increasing, and a violent sea from the westward coming on, we were obliged to lie to under our close reefed top-sails. At four in the afternoon, the weather became very thick, and in less than half an hour we saw the south shore, at the distance of about a mile, but got no anchorage; we therefore tacked, and stood over to the north shore. At eleven we saw the land on the north shore, at which we were much alarmed; when to heighten the danger of our situation, the sky suddenly became dark and lowering, and the noise of the waves, which we plainly heard dashing against the precipices, seemed to foretell the disaster which we thought ourselves near experiencing; but at the very instant, when we expected immediate destruction, by hoisting out our head sails, our ship veered round on the other tack, and left the breakers, on which we made sail with our head to the southward. During this critical situation, from which we had been so providentially delivered, the officers and men united in doing their utmost, to extricate us from the impending danger, and behaved with that alacrity and intrepidity, which so strongly characterize those who compose our naval force, who justly merit this transient testimony to their honour. We now made a signal for the Tamar to come up, supposing her case to be equally desperate with our own: No. 28.

however she soon failed a-head, firing a gun, and showing lights, whenever she saw land. Our situation was now very alarming; the storm increased every moment, the weather was exceeding thick, the rain seemed to threaten another deluge, we had a long dark night before us, we were in a narrow channel, and surrounded on every side with rocks and breakers. By the violence of the wind, our mizen-top-sail was split from the yard, and rendered entirely useless. During this tempestuous night we parted company with our consort. We now brought to, keeping the Dolphin's Head to the S. W. but there being a prodigious sea, it broke over us so often, that the whole deck was almost under water. After bending a new mizen-top-sail, and repairing as well as we could the damages our ship had suffered, on the 27th, about five in the morning, to our inexpressible joy, the day began to dawn upon us; but the weather was so hazy, that no land could be seen, though we knew it could not be far distant, and it might be close under our lee. We therefore made a signal for the Tamar to come under our stern, which having done, we bore away, and, at seven, both ships came to an anchor in Cape Monday Bay, about one mile to the eastward, with the small bower, in 23 fathoms water, and veered out to a whole cable. We had twice in this perplexing traverse been within four leagues of Tuesday's Bay, at the western entrance of the strait, and had twice been driven back 10 or 12 leagues by the fury of opposing storms. When the season is so far advanced as it was when we attempted the passage through this strait, it is a most difficult and dangerous undertaking, as it blows a hurricane incessantly night and day, and the rain is as violent and constant as the wind, with such fogs as often render it impossible to discover any object at the distance of twice the ship's length. Our Commodore, after attending to the necessary refreshments of his officers and men, who had endured the greatest fatigues, thought proper to name the high-land, which we had so miraculously escaped, Cape Providence. It rises to a very great height, and projects to the southward, being situated about four or five leagues from Cape Monday, but upon the opposite shore. On the 28th, finding our cables much damaged by the rocks, we condemned our best bower, and cut it into junk. We also bent a new one, which we rounded with old rigging eight fathoms from the water. In the mean time the Tamar had parted from her anchor, and was drove over to the east-side of the bay. She was brought up at a small distance from some rocks, against which she might otherwise have been dashed to pieces. On the 29th, at seven o'clock, A. M. we weighed and set sail, but, at intervals, were attended with hard squalls from the westward, with heavy rains. While we were working to windward, the Tamar, steering by the south coast, ran a-ground, and made the signal of distress, by firing a gun, and hoisting her ensign in the mizen-shrouds; on which we stood again into the bay, bore down to her assistance, and hoisted out our boats. We sent anchor hawfers, with which they soon hove her off, and she came to anchor near us in Monday Bay.

On Saturday the 30th, the winds were so violent as perfectly to tear up the sea, and carry it higher than the top-masts. The storm came from W. N. W. and was more furious than any preceding one. A dreadful sea rolled over us, and dashed against the rocks with a noise like thunder. Happily, we did not part our cables, of which we were in constant apprehension, knowing the ground to be foul. Finding the ship laboured much, we lowered all the main and fore-yards, let go our small bower, veered a cable and a half on the best bower, and having bent the sheet cable, stood by the anchor all the rest of the day. On the 31st, about one o'clock, A. M. the weather, though somewhat moderate, continued till midnight to be dark, rainy, and tempestuous, when soon after the wind changed to the S. W.

On Monday the 1st of April, we had soft and moderate gales; yet still the weather continued thick, attended with heavy rain. At eight o'clock, A. M. we weighed our best bower, and found the cable much wounded

wounded in several places, which we thought a great misfortune, it being a fine new cable that had never been wet before. On the 3d, an officer was sent from each ship in the Tamar's boat, in quest of anchoring places on the south shore; and at the same time an officer was sent in our Commodore's cutter, to explore the north shore. On the 4th, the cutter returned, with an account of having found a proper anchoring place to the west of the north shore. The commanding officer had met with a party of Indians, whose canoe was of a construction not observed before, being composed of planks sewed together. These Indians had no other covering than a piece of seal-skin thrown over their shoulders. Their food, of the most indelicate kind, was eaten raw. One of them tore a piece of stinking whale's blubber with his teeth, and then gave it his companions, who followed his example. One of these Indians, observing a sailor asleep, cut off the hinder part of his jacket with a sharp flint. About eight o'clock, A. M. we got under sail, and at six in the evening anchored in the bay, on the southern shore, which had been discovered, proposing to take in wood and water. While we lay here, several of the natives made a fire opposite to the ship; on which we invited them to come on board, by all the signs we could devise; but as they would not comply, the Commodore went on shore in the jolly-boat, and made them presents of several trifles, which much pleased them. He likewise distributed some biscuits among them, and was surprized to remark, that if one fell to the ground, not a single individual would offer to take it up without his permission. In the mean time some of the sailors being employed in cutting grafs for the few remaining sheep we had on board, the Indians instantly ran to their assistance, and, tearing up the grafs in large quantities, soon filled the boat. We were much delighted with this token of their good will, and we saw they were pleased with the pleasure the Commodore had expressed on the occasion. When he returned to the ship, they followed him in their canoe, till they came near the Dolphin, at which they gazed with the most profound astonishment. Four of them were at length prevailed on to venture on board; and the Commodore, with a view to their diversion, desired one of our midshipmen to play on the violin, while some of the seamen danced. The poor Indians were extravagantly delighted; and one of them, to testify his gratitude, took to his canoe, and fetching some red paint, rubbed it all over the face of the musician; nor could the Commodore, but with the utmost difficulty, escape the like compliment. When they had been diverted some hours, it was hinted to them, that they should go on shore, which they at length did, though with the utmost reluctance.

On Sunday the 7th, at six o'clock, A. M. we weighed, and got under sail, with the wind at E. S. E. At this fortunate change of weather joy appeared in every countenance, and never were people in higher spirits. For six weeks we had been beating to windward, having been several times driven back, and narrowly escaped the greatest dangers: but we now flattered ourselves, that we should shortly arrive in the Pacific Ocean, the ultimate end of our wishes; but at eleven o'clock the wind ceased, and the current drove us two leagues, Cape Upright bearing S. E. five leagues, on which we came to with the stream anchor, in 110 fathoms water. At four o'clock, P. M. the boat belonging to the Tamar, which had, as we mentioned, been sent out some time before, returned from the westward, having been to the southward of Cape Deshada, on the south shore, and found many convenient places for anchorage; but the people in the boat were much fatigued by their long and laborious rowing. On the 8th, at two o'clock, A. M. we set sail, with the wind at W. by N. and at eleven, came to an anchor in a very good bay, between Cape Upright, and Cape Pillar. In this bay we found plenty of excellent fish not much unlike our trout, only of a more red cast. We here met with good anchorage, entirely secure from any winds from the N. N. W. to the S. E. and here you may sail with equal safety and

pleasure, having from 14 to 20 fathoms muddy ground. About four in the afternoon, the wind came to the S. E. which gave us high satisfaction. We instantly weighed and sailed from the bay, in order to proceed to the westward. On standing out we saw the Tamar at anchor in Tuesday Bay, which lies on the south shore; but the wind suddenly veering round from the S. S. E. to the S. W. in a very heavy squall, attended with rain, obliged us to carry fail to get to an anchor in that bay; and the night approaching fast, the Tamar kept burning false fires, to direct us into it: but in order to enter, we were obliged to make several tacks under close reefed top-sails, in very great disorder, having rocks on each side: however we at last came to an anchor, with the small bower, in 12 fathoms; but the wind blew so strong, it was some time before we could get our sails handed.

Tuesday Bay is by far the finest we saw in these straits. It is capable of containing a number of large ships, which may ride in the greatest security, with good ground, at not more than 25 fathoms water, free from rocks and sands. Into this bay Sir John Narborough recommends all ships to anchor, that are bound to the westward. Indeed we found no difficulty in being supplied with good wood and water, and with excellent fish in large quantities. Along the sides of the rocks are beautiful cascades of water, with which the casks may be filled with the greatest convenience. On the 9th, at six o'clock, A. M. we weighed, leaving this fine bay, and sailing to the W. N. W. We passed Cape Pillar on the south shore, with a fine gale from the S. E. where the straits are about nine leagues over. At ten, having now no occasion to be continually sounding, for fear of shoals and sunken rocks, we got our long boat, yawl, and six oared cutter under the half deck, with the 12 oared cutter under the booms; and secured the hatches, bulk heads of the quarter deck, and fore-castle. At four in the afternoon we reached the extremity of the straits, where the distance from Cape Victory on the north-shore, to Cape Deshada on the south shore, is 12 leagues, bearing from each other about N. and S. The whole length of the Straits of Magellan, in which we had been detained, chiefly by contrary winds, from the 17th of February to the 9th of April, is from Cape Virgin Mary to Cape Deshada, with every reach and turning, no more than about 116 leagues. We were now to leave the cold climate, and the tempestuous seas of this southern latitude, just after the time of the autumnal equinox, with the dreadful hurricanes that must unavoidably attend the approach of winter, and to steer joyfully to the northward, warmed with the hopes of meeting with calmer seas, and milder climates. But notwithstanding the difficulties and sufferings we experienced in passing the straits of Magellan, when the weather we met with was beyond all description dreadful, yet the Commodore prefers this passage to going round Cape Horn, which he had twice doubled, and he recommends it to future navigators, to be at the eastern entrance of the strait in the month of December, at which time he thinks even a fleet of ships might navigate it safely in about three weeks. He justly observes, that the facility with which wood and water are to be obtained, the vast plenty of vegetables, and the abundance of fish, which may be almost every where procured, are advantages highly in favour of this passage. On our entering the Pacific Ocean, we found a great swell running from the S. W.

On Friday the 20th, we desiered the island of Mafu Fuero to the westward. The Commodore thought it more advisable to touch here, than at the island of Juan Fernandes; it being rather more secure than the latter, from any discoveries which the Spaniards might make of our designs; in consequence of which our voyage, and all farther discoveries might have been prevented. Mafu Fuero lies in the latitude of 33 deg. 28 min. S. and in 84 deg. 27 min. W. longitude from London. On the 27th, we had a distant view of the island, the land of which rises to a great height. Our cutter was sent ashore to find a place to anchor in, but returned at four in the afternoon without success, but

but caught a great number of fish. They had no soundings with 100 fathoms line. On the 28th, however, we came to an anchor on the east-side of the island, in 24 fathoms water, at which time the extremities of the island appeared on the S. and N. W. The tops of the mountains are not always to be seen, they being in some parts covered with clouds, which hang hovering over them, and the air on their tops being seldom clear. At eleven in the morning we sent out our boat, with an officer, to find out a convenient place to wood and water in on shore.

The surface of this island is very irregular; but the valleys have a beautiful verdure, and their sides are full of trees from the top to the bottom. At a great distance indeed those beauties are not visible, but when within a mile or thereabouts, they form a most delightful prospect. The goats, which we saw in great numbers, were so shy, that we found it difficult to get near them, especially within the distance of a musket shot; however, we made a shift to kill some, and we thought them to be excellent food, particularly the kids. We observed a remarkable circumstance, with respect to two of them which we shot, they having had their ears slit when young. It is probable, that the men who were sent on board the *Tryal Sloop* by Lord Anson, to examine into the state of this island, had more serious employment than that of slitting the ears of the goats; and it appears much more probable, that some solitary Selkirk had dwelt here, who, like his namesake, at Juan Fernandez, when he caught more than he wanted, marked, and let them go. However, during our stay at this place, we saw no traces of any human being. Round the south-side of the shore we found a red earth, impregnated with large veins of a gold colour. The shores are every where very steep, and near them you cannot find less than from 24 to 50 fathoms. We found it every where difficult to get on shore, it being full of rocks and large stones, with a very great surf. Round the island we met with great quantities of fish, such as cavalies, bream, maids, and congers of a particular kind: with a singular sort of fish called chimney-sweepers, somewhat like our carp, only larger. There is another species of valuable fish which we called cod. It is not exactly like our cod in shape, but the taste is equally agreeable. We likewise found a great number of cray-fish, which were so large as to weigh eight or ten pounds each. We saw a multitude of sharks, one of which was near carrying off one of our men. As the great swell would not permit the boat to approach the shore, he was swimming a cask to it; but the sailor who was always left to take care of the boat, saw the shark within a few yards of his companion, just ready to seize upon him, and called to him to hasten ashore, which, through his great fright, he could hardly reach. The boat-keeper having the boat-hook in his hand, struck at the shark with great force, but without any visible effect. The dog-fish we met with here are very mischievous, and destroy abundance of the smaller sort of fish: they frequently obliged us to haul in our lines, for when near, no other fish are to be found. Besides these, the shore is generally crowded with seals, and sea-lions. The dog-fish does not appear to have the least resemblance of a dog, or any other animal, and therefore it is difficult to determine the derivation of its name. It has a roundish body, and instead of scales, is covered with that rough skin used by joiners and cabinet-makers for polishing wood, generally known by the name of fish-skin. Its back is of a brownish ash-colour; but its belly is commonly white, and smoother than the rest of its body. The eyes are covered with a double membrane, and the mouth armed with a double row of teeth. It has two fins on the back, with sharp prickles standing before them. It brings forth its young alive, and is never very large, seldom weighing more than 20 pounds. The sea-lion has some resemblance to a seal, but is of a much larger size, for these animals, when full grown, are from 12 to 20 feet in length, and from 8 to 15 feet round. The head is small in proportion to the body, and terminates in a snout. In each jaw they have a row of large pointed

teeth, two thirds of which are in sockets: but the others, without them, are most solid, and stand out of the mouth. They have small eyes and ears, with whiskers like a cat, and small nostrils, which are the only part destitute of hair. The males are distinguished by having a large snout or trunk, hanging five or six inches below the end of the upper jaw, which the females have not. The skin of the sea-lion is covered with a short light dun coloured hair, but his fins and tail, which when on shore, serve him for feet, are almost black; the fins or feet are divided at the ends like toes, but are joined by a web, that does not reach to their extremities, and each toe is furnished with a nail. They are so extremely fat, that on cutting through the skin, which is near an inch in thickness, there is at least a foot of fat before you come to either lean or bones; and yet they are so full of blood, that if deeply wounded in 10 or 12 places, there instantly gushes out as many fountains of blood, spouting to a considerable distance. Their flesh resembles in taste that of beef; and their fat, on being melted, makes good oil. The males are of a much larger size than the females, and both of them continue at sea all the summer, and coming ashore at the beginning of winter, stay there during that season, when they engender, and bring forth their young, having commonly two at a birth, which they suckle with their milk. On shore they feed on the verdure that grows near the water: and sleep in herds, in the most miry places they can find, with some of the males at a distance, who are sure to alarm them, if any one approaches, sometimes by snorting like horses, and at others by grunting like hogs. The males have frequently furious battles about their females.

This island is usually called by the Spaniards, the Lesser Juan Fernandez, it being about 22 leagues to the W. by S. of the island more frequently called by that name: and is termed Mafa-Fuero, from its being at a greater distance from the continent. In his way to this place, the Commodore was not far from the spot, where he had endured the extremity of wretchedness 24 years before, when he was a midshipman, under Captain Cheap, on board the *Wager*, a frigate of 28 guns, one of the squadron which was commanded by Commodore Anson, in his memorable expedition to the South Sea, and which was wrecked on the shore of an island on the coast of Chiloe. In many respects this island and that of Juan Fernandez resemble each other: the shore of both is steep, and for the most part have little fresh water; but no spring was here found comparable to that of the watering place at the Greater Juan Fernandez: they are both mountainous, and adorned with a variety of trees, which with the different bearings of the hills, and the windings of the valleys form, even from the sea, the most rude, and at the same time the most elegant prospects. None of the trees of the greater Juan Fernandez are large enough for any considerable timber, except the myrtle, the trunks of some of which are of such a size, as to be worked 40 feet in length. But the goats of the greater Juan Fernandez are much fewer in number than at Mafa-Fuero; the Spaniards having placed no dogs on the latter island, in order to destroy them. With respect to the plenty of excellent fish, and the number of amphibious animals, as seals and sea-lions, which line the shores of both, they perfectly resemble each other. In Mafa-Fuero are many cascades, or fine falls of water, pouring down its sides into the sea. But our stay here was so short, and we were so seldom on shore, that we had neither leisure nor opportunity to view this little island, with the accuracy and precision that might be wished, and that was absolutely necessary for taking a full view of the delightful spots which we saw, with the confusion that necessarily attends a distant prospect. The greatest disadvantage belonging to this island is that of not having such a commodious harbour, as the island of Juan Fernandez.

While we were taking in water for the ships, whenever our men found any great surf, they by order of the Commodore, swam to and from the boats in cork jackets; for he would by no means admit of their going into

into the water without putting them on, he being fully sensible, that when properly secured on the body, the person who uses them cannot possibly sink, or suffer any considerable inconvenience, if he does but take care to keep his head above the surface of the water, which is easily done. But these jackets afforded no defence against the sharks, which were often very near the swimmers, and would dart even into the very surf to seize them: our people however providentially escaped them. One of these voracious fish seized a large seal close to one of the watering boats, and devoured it in an instant; and the Commodore saw another do the same, close to the stern of the ship. The following little adventure also took place while we lay off this island. The gunner and one of the seamen, who were with others, on shore for water, were left behind all night, being afraid to venture in the boat, as the sea ran high. The commodore being informed of this circumstance, sent them word, that as blowing weather might be expected, the ship might be driven from her moorings in the night; in which case they would infallibly be left behind. This message being delivered, the gunner swam to the boat; but the sailor saying, he had rather die a natural death than be drowned, refused to make the attempt: and taking a melancholy farewell of his companions, resolved to abide his fate; when just as the boat was going to put off, a midshipman took the end of a rope in his hand, and swam on shore, where he

remonstrated with the disconsolate tar on the foolish resolution he had taken, till having an opportunity of throwing the rope, in which was a running knot, round his body, he called to the boats crew to haul away, who instantly dragged him through the surf into the boat: he had, however, swallowed so much water that he appeared to be dead; but by holding him up by the heels, he was soon recovered; and on the day following was perfectly well.

Having taken in as much wood and water as the weather would permit, the surf sometimes swelling in such a manner, as to prevent our boats coming near the shore, we thought of leaving the island; but before our departure, in the evening of the 29th, the Commodore removed Captain Mouat from the Tamar, and appointed him Captain of the Dolphin, all flag-officers having a commander under them. This occasioned several other changes. Mr. Cumming, our first lieutenant, was appointed Captain of the Tamar, and we received in his room Mr. Carteret, her first lieutenant. The Commodore also gave Mr. Kendal, one of the mates of the Dolphin, a commission as second lieutenant of the Tamar. After these promotions, on the 30th, we weighed, and steered along the E. and N. E. side of the island, but could find no anchoring place; we bore away therefore, with a fresh breeze at S. E. and at noon the center of the island was distant eight leagues in the direction of S. S. E.

C H A P. III.

The Dolphin and Tamar continue their course from the Island of Mafa-Fuero westward—Arrive off certain beautiful Islands, which are named the Islands of Disappointment, because no places of anchorage could be found—The natives of these Islands described—King George's Islands discovered—Another Island is seen, and called the Prince of Wales's Island—A description of these islands—Also a particular account of the inhabitants, and of several incidents that happened while the ships were exploring them—The Island of Danger passed—The Duke of York Island discovered—Another new island found, which receives the name of Byron's Island—The persons and behaviour of the Indians described.

ON the first of May, being Wednesday, we continued to steer N. by W. but on the 2nd, at noon, we altered our course, and steered due west, with the view of falling in with an island, which is laid down in the charts by the name of Davis's Land, in latitude 27 deg. 30 min. S. but on Thursday the 9th, the Commodore laid aside his design, being in latitude 26 deg. 46 min. S. and in 94 deg. 45 min. W. longitude; and, having a great run to make, he determined to steer a N. W. course, till he should fall in with a true trade wind, and then to search for Solomon's Islands; but the discovery of both these spots of land was reserved for a future navigator; for the Commodore, in crossing the southern ocean, missed the islands, which have since been named the Society Isles; and about the same distance to the southward of the Marquesas, discovered by Mendana, a Spaniard, in the year 1597, and afterwards explored by Captain Cook. We had hitherto enjoyed a continued series of fine weather; but the nearer we approached the line, the crew began to fall down with the scurvy very fast, and every day, to the end of this month, brought with it an increase of that dreadful disorder. On the 10th, and following day, we saw several dolphins and bonettas round the ship, and observed a few birds which had a short beak, all their bodies being white, except the back, and the upper part of their wings. On the 14th, in latitude 24 deg. 30 min. S. and in 97 deg. 45 min. W. longitude, we saw more of these birds, and several grampuses, from whence imagining we might approach toward some land, we kept a good look out, but found our expectations disappointed.

On Thursday the 16th, two remarkable birds, as large as geese, with white bodies, and black legs, were observed flying very high, from whence it was conjectured that we had passed some main-land, or islands, to the southward of us; for the last night we observed, that,

notwithstanding we had a great swell from that quarter, yet the water became quite smooth for a few hours, after which the swell returned. On Wednesday the 22nd, being in latitude 20 deg. 52 min. S. and in 115 deg. 38 min. W. the swell from the southward was so great, that we expected every minute, to see our masts roll over the ship's side; to prevent which, and to ease the ship, we hauled more to the northward. This day we caught, for the first time, two bonettas, and were visited by some tropic birds, larger than any we had seen before. Their whole plumage was white, and they had in each of their tails two long feathers.

On Sunday the 26th, we were in latitude 16 deg. 55 min. S. and in 127 deg. 55 min. W. longitude, when we saw two large birds about the ship, all black, except their necks and beaks. The feathers of their wings and tails were long, yet they flew very heavily. We supposed them, from this last circumstance, to be a species that did not fly far from the shore. We had imagined, that before we had run six degrees to the northward of Mafa-Fuero, we should have been favoured with a settled trade wind to the S. E. but the winds still continued to the north, though we had a mountainous swell from the S. W. On the 28th, two other birds, one black and white, and the other brown and white, would have settled on the yards, but were intimidated by the working of the ship. On the 31st, our people began to fall down with the scurvy very fast, which made us wish for land. At length, after a passage of 31 days,

On Friday the 7th of June, at one o'clock, A. M. the Tamar made the signal of seeing land; on which we brought to till day light; and in the mean time flattered ourselves with the pleasing hopes of getting some kinds of refreshments, of which we stood in great need, especially for those who were sick; and we knew, that the islands, which are situated within

twenty degrees of the line, are frequently well stored with fruit of all kinds. Soon after day-break, we had the pleasure of seeing a low small island covered with beautiful trees, and on sailing to the leeward, we were regaled with the smell of the finest fruits. The poor wretches who were able to crawl upon deck, stood gazing on this little paradise, which however nature had forbidden them to enter, with sensations which cannot easily be conceived. They saw cocoa-nuts in abundance, the milk of which is perhaps the most powerful antiscorbutic in the world; and to increase their mortification, they saw the shells of many turtles scattered about the shore. These refreshments, for want of which they were languishing to death, were as effectually beyond their reach, as if there had been half the circumference of the globe between them; for an officer, having been quite round the island, reported, that no bottom could be found, within less than a cable's length from the shore, which was surrounded, close to the beach with a steep coral rock; and that, at the distance of three quarters of a mile from the shore, no soundings could be had with 140 fathom of line. Besides, had we at one place cast anchor in 45 fathoms, the surf upon the shore was so great, that the ship would have been in great danger of being stranded. This island lies in the latitude of 14 deg. 5 min. S. and in 145 deg. 4 min. W. longitude from London. It extends 12 miles in length; and in the body of the island is a good deal of water, which was, we apprehend, washed over the banks, as some of them appeared to have been broken. We soon perceived it was inhabited, for we saw numbers of Indians upon the beach, with spears in their hands, that were at least 16 feet long. They ran along the shore, abreast of the ships, dancing, hallooing, and shouting in the most hideous manner. They frequently brandished their long spears, and then threw themselves backwards, and lay a few minutes motionless, as if they had been dead; doubtless meaning to signify thereby, that they would kill whoever should presume to go on shore. Notwithstanding various signs of amity and good will were made them by our people in the boat, nothing could abate their hostile disposition. They made in their turn signs for us to be gone; and always took care, as the boat sailed along the shore, to move in the same direction, and accompany it; and though the men saw some turtle at a distance, they could get at none, as those Indians still kept opposite to them. The sailors were eager to fire on the brave defenders of their native soil, but their officers withheld them from such a wanton act of cruelty; and as no anchorage could be found, the Commodore thought it most advisable to steer to the adjacent island. These Indians are of a very black complexion, with well proportioned limbs, and seemed to be extremely active, and fleet of foot to an astonishing degree. Their women, who were only to be distinguished by their bosoms, had something twisted round their waists, and hanging down from thence, to hide what nature taught them to conceal, as had also the men; and this was their only cloathing. They altogether amounted to about 50 in number; and to the S. W. we could perceive their huts, under the shade of the most lovely grove we ever saw. While sailing along shore, we took notice, that in one place the natives had fixed upright in the sand two spears, to the top of which they had fastened several things that fluttered in the air, and that some of them were every moment kneeling down before them, as we supposed, invoking assistance of some invisible being to defend them against their invaders. Among other signs of good will that they could devise, our men threw them bread, and many other things, none of which they vouchsafed so much as to touch, but with great expedition hauled five or six large canoes, which we saw on the beach, up into a wood. When this was done they waded into the water, and seemed to watch for an opportunity of laying hold of the boat, that they might drag her on shore.

On Saturday the 8th, the boats having reported a second time, that no anchoring ground could be found about this island, we worked, at six o'clock, P. M.

No. 28.

under the lee of the other island, which lay to the westward of the former, and sent out our cutter to sound for a place to anchor in. We now observed several other low islands, or rather peninsulas, most of them being joined one to the other by a neck of land, very narrow, and almost level with the surface of the water, which breaks high over it. Here, to our great disappointment, no refreshments could be procured, owing to the inaccessible nature of the coast; and we saw a much greater number of Indians surrounding the shore, who, with spears of equal length, followed us in like manner, several hundreds of them running about the coast in great disorder; and at the same time we beheld the island covered with a prodigious number of cocoa-nut, plantain, and tamarind trees. Having waited some time with great impatience for the return of our cutter, we fired a gun, as a signal for our men to come on board, which terribly alarmed the Indians, who seemed to consult among themselves what measures it would be most prudent for them to take. They kept abreast of the boats, as they went sounding along the shore, and used many threatening gestures, to deter them from landing. Their canoes they dragged into the woods, and at the same time the women came with great stones in their hands, to assist the men in preventing, what they doubtless thought to be, our hostile intentions. The cutter returned near noon, bringing much the same account of this as of the other island, there being no soundings at a cable's length from the shore, with a line of 100 fathoms. This gave us inexpressible concern, as we had now 30 sick on board, to whom the land air, the fruit and vegetables, that appeared so beautiful and attractive, would have afforded immediate relief and returning health. Finding it impossible to obtain those tempting refreshments which hung full in our view, we quitted, with longing eyes, this paradise in appearance, to which the name was with propriety given of the Islands of Disappointment. Continuing our course to the westward, on the 9th we saw land again, at the distance of seven leagues, W. S. W. At seven o'clock, P. M. we brought to for the night. In the morning of the 10th, being within three miles of the shore, we found it to be a long low island, with a white beach of a pleasant appearance, covered with cocoa-nut and other trees, and surrounded with a rock of red coral. We stood along the N. E. side, within half a mile of the shore, and the natives, on seeing us, made great fires, and ran along the beach, abreast of the ships in great numbers, armed like the natives of the islands we had last visited, and like them, they appeared to be a robust and fierce race of men. Over the land we could discern a large lake of salt-water, which appeared to be two or three leagues wide, and to reach within a small distance of the opposite shore. Into this lake we observed a small inlet, about a league from the S. W. point, where is a little town seated under the shade of a fine grove of cocoa-nut-trees. The Commodore immediately sent off the boats to sound; but they could find no anchorage, the shore being every where perpendicular as a wall, except at the mouth of the inlet. We stood close in with the shore, and saw hundreds of the natives ranged in good order, and standing up to their waists in water: they were all armed, like those we had seen in the other islands, and one of them carried a piece of mat, fastened to the top of a pole, which we imagined was an ensign. They made a loud and incessant noise; and in a little time, many large canoes came down to the boats, but with no friendly intentions, for we soon perceived their main design was to haul our boats on shore. One of them went into the Tamar's boat, and with the greatest adroitness seized a seaman's jacket, and jumping overboard with it, never once appeared above water, till he was close in shore among his companions: another got hold of a midshipman's hat, but not knowing how to take it off, he pulled it downwards, instead of lifting it up; so that the owner had time to prevent his taking it away. Our seamen bore these insults with much patience, as transgressions of the simple children of nature.

Finding about noon, that there was no anchorage here, we steered along the shore to the westernmost point of the island, and when we came to it we saw another island, bearing S. W. by W. at about four leagues distance. We were now about one league beyond the inlet, where we had left the natives; but they were not contented with our having quietly left them; for we now observed two large double canoes sailing after the ship, with about 30 men in each, all armed after the manner of their country. The boats were a good way to leeward of us; and the canoes passing between the ship and the shore, seemed to chase them with great resolution. Upon this the Commodore made a signal for the boats to speak with the canoes, which they no sooner perceived, than they turned towards the Indians, who being instantly seized with a sudden panic, hauled down their sails, and paddled away at a surprizing rate. The boats, however, came up with them; but notwithstanding the dreadful surf that broke upon the shore, the canoes pushed through it, and were instantly hauled upon the beach. Our boats followed them, when the natives, dreading an invasion of their country, prepared to defend it with javalins, clubs, and stones: upon seeing this our men fired, and killed two or three of them; one of whom who stood close to the boats, received three balls, which passed quite through his body; yet he afterwards took up a large stone, and died in the action of throwing it. The Indians carried off the rest of their dead, except this one man, and made the best of their way back to their companions at the inlet. The boats then returned, and brought off the two canoes they had pursued. One of them was 32 feet long, and the other somewhat less: both were of a very curious construction, and must have been formed with prodigious labour. They consisted of planks exceedingly well wrought, and in many places adorned with carving; these planks were sewed together, and over every seam there was a slip of tortoiseshell, very ingeniously fastened to keep out the weather. Their bottoms were as sharp as a wedge; and the boats being very narrow, two of them were joined laterally together by a couple of strong spars, so that there was a space of about eight feet between them. A mast was hoisted in each, and a sail was spread between the masts: this sail was made of matting, and remarkable for the neatness of its workmanship. Their paddles also are very curious, and their cordage as good, and as well made as any in England, though it appeared to be made only of the outer covering of the cocoa-nut. When these vessels sail, several men sit on the spars which hold the canoes together. The surf which broke high upon the shore, rendering it impossible to procure refreshments for the sick, in this part of the island, we returned back to the inlet, in order to try what more could be done there; but the boats being sent to sound the inlet again, returned, and confirmed their former account, that it afforded no anchorage for a ship. While the boats were absent, a great number of the natives were seen upon the spot where we had left them in the morning, who seemed very busy in loading and manning some canoes which lay close to the beach. The Commodore, thinking they might be troublesome, and being unwilling to have recourse to the sanguinary means which had before been used, fired a shot over their heads, which produced the intended effect, for they instantly dispersed. Just before the close of the evening, our boats landed, and brought off a few cocoa-nuts, but saw none of the inhabitants.

On Tuesday the 11th, in the morning, the Commodore, with all the men who were ill of the scurvy, and capable of doing it, went on shore, where they continued the whole day. The houses were totally deserted, except by the dogs, who howled incessantly, from the time we came on shore, till we returned to the ship. The wigwams were low mean structures, thatched with the leaves of cocoa-nut trees; but they were delightfully situated in a fine grove of stately trees: many of which were such as we were entirely unacquainted with. The shore was covered with coral, and shells of very large pearl oysters, and the Commodore firmly believed,

that as profitable a pearl fishery might be established here as any in the world. In one of the huts was found the carved head of a rudder, which had evidently belonged to a Dutch long-boat. It was very old and worm-eaten. A piece of hammered iron, a piece of brass, and some small iron tools, were also found, all which had most probably been obtained from the same ship to which the boat belonged. The inhabitants of these islands were not over-burdened with cloathing: the men we saw were naked, but the women had a piece of cloth of some kind hanging from the waist as low as the knee. The cocoa-nut tree seems to furnish them with all the necessaries of life, particularly food, sails, cordage, timber, and vessels to hold water. Close to their houses we discovered buildings of another kind, which appeared to be burying-places. They were situated under lofty trees that gave a thick gloomy shade: the sides and tops were of stone, and they somewhat resembled in their figure, the square tombs with a flat top in our country church-yards. Near these buildings we found many neat boxes, full of human bones; and upon the branches of the trees that shaded them, hung a great number of heads and bones of turtles, and a variety of other fish, inclosed with a kind of basket-work of reeds. We here saw no venomous creature; but the musketoes covered us from head to foot, and infested not only the boat, but the ship, being an intolerable torment. We observed a great number of parrots, and paroquets, with a variety of other birds, altogether unknown to us. We saw also a beautiful kind of doves, so tame, that some of them frequently came close to us, and followed us into the Indian huts. The fresh water here is good but rather scarce: the wells that supply the natives being so small, that when two or three cocoa-nut shells have been filled from them, they are dry for a few minutes; but as they presently fill again, if a little pains were taken to enlarge them, they would abundantly supply any ship with water. We obtained cocoa-nuts and scurvy-grass in great quantities, which were most inestimable acquisitions, as by this time there was not a man on board who was wholly untouched with the scurvy. All this day the natives kept themselves closely concealed, and did not even make a smoke upon any part of the island, as far as we could see. In the evening we all returned on board, highly pleased with this day's amusement and work. This island lies about 67 leagues from the islands of Disappointment, in the direction of W. half S. and in the latitude of 14 deg. 29 min. S. longitude 148 deg. 50 min. W. The inhabitants seem to have some notions of religion, as we saw a place, which we concluded to be appropriated to their manner of worship. A rude, but very agreeable avenue opened to a spacious area, in which was one of the largest and most spreading cocoas we saw in the place; before which were several large stones, probably altars; and from the tree hung the figure of a dog adorned with feathers.

On Wednesday the 12th, we visited another island which had been seen to the westward; and steered S. W. by W. close along the N. E. side of it, which is about six or seven leagues long. This island makes much the same appearance as the other, having a large salt lake in the middle of it. The ship no sooner came in sight, than the natives repaired in great numbers to the beach, armed in the same manner as those already described, but not of such boisterous manners. The boats sounded as usual along the shore, but had strict orders not to molest the Indians, except it should be absolutely necessary in their own defence; but on the contrary, to use every gentle method in order to obtain their confidence and good will. They rowed as near the shore as they durst for the surf; and making signs of their wanting water, the Indians readily understood them, and directed them to run down farther along the shore, which they did, till they came abreast of such a cluster of houses, as we had just left upon the other island. The Indians followed them thither, and were there joined by many others. The boats immediately hauled close into the surf, and we brought to with the ships, at a little distance from the shore; upon which, a

flout old man, with a long white beard, came down from the houses to the beach, attended by a young man, and appeared to have the authority of a chief or king. On his making a signal, the rest of the Indians retired to a small distance, and he then advanced to the water's edge, holding in one hand the green branch of a tree, and in the other grasping his beard, which he pressed to his bosom. In this attitude he made a long speech, or rather song, for it had an agreeable cadence. We were sorry that we could not understand him, but to shew our good will, while he was speaking, we threw him some trifling presents, which he would neither touch himself, nor suffer them to be touched by others, till he had done. He then walked into the water, and threw to us the green branch; after which he took up the things which had been thrown from the boats. Every thing having now a friendly appearance, we made signs that they should lay down their arms; and most of them having complied, one of the midshipmen, encouraged by this testimony of confidence and friendship, leaped out of the boat with his clothes on, and swam through the surf to the shore, on which the Indians flocked round him, singing and dancing as if to express their joy, and began to examine his clothes with seeming curiosity; they particularly shewed signs of admiration on viewing his waistcoat; upon which he took it off, and presented it to them. This act of generosity had a disagreeable effect; for he had no sooner given away his waistcoat, than one of the Indians untied his cravat, and the next moment snatched it from his neck, and ran away with it. He therefore, to prevent his being stripped, made the best of his way back to the boat. We were still however upon good terms, and several of the Indians swam off to us, some of them bringing a cocoa-nut, and others a little fresh water in a cocoa-nut shell. We endeavoured to obtain from them some pearls, but we could not make ourselves understood. We should, however, probably have succeeded better, had an intercourse of any kind been established between us; but unluckily no anchorage could be found for the ships. In the lake we saw two very large vessels, one of which had two masts, and some cordage aloft. To these two islands the Commodore gave the name of King George's Islands, in honour of his present Majesty. That which we last visited lies in latitude 14 deg. 41 min. S. longitude 149 deg. 15 min. W.

On Thursday the 13th, having continued our course to the westward, about three o'clock, P. M. we descried land, bearing S. S. W. distant six leagues. We immediately stood for it, and found it to lie E. and W. and to be about 60 miles in length. It is distant from King George's Islands about 48 leagues, in the direction of south 80 deg. W. situated in the latitude of 15 deg. S. and the westernmost end of it in 151 deg. 53 min. W. longitude. We ran along the south-side of it, and the appearance of the country exhibited a pleasant green surface; but a dreadful surf breaks upon every part of the shore, with foul ground at some distance, and at about three leagues are many rocks and islets. It has a narrow neck of land running S. by W. and N. by E. We saw a number of Indians, and several canoes dispersed about different parts of the island, to which was given the name of the Prince of Wales's Island. From its western extremity, we steered north 82 deg. W. and on the 16th at noon, observed in latitude 14 deg. 28 min. S. and in 156 deg. 23 min. W. longitude. The mountainous swell from the southward, which to this day we had lost, now returned; and we were attended with vast flocks of birds, which in the evening took their flight to the southward; from which appearances we concluded, more land lay in that direction; the discovery of which we should have attempted, had not the sickness of the crews in both ships been an insuperable bar to such an attempt. On the 17th, the swell continued, and various kinds of birds flew about the ship; supposing therefore land to be not far distant, we proceeded with caution, for the islands in this part of the ocean render navigation very dangerous, they being so low, that a ship may be close in with them before they are seen. Nothing material occurred on

the 18th and 19th. On the 20th, we found our latitude to be 12 deg. 33 min. S. longitude 167 deg. 47 min. W. The prince of Wales's Island, distant 313 leagues.

On Friday the 21st, at seven o'clock, A. M. we again saw land a-head, bearing W. N. W. and distant about eight leagues. It had the appearance of three islands from this point of sight; and the Commodore took them for Solomon's Islands, seen by Quiros, in the beginning of the 17th century, and very imperfectly described by him. But on our nearer approach, we found only a single island, about 12 miles in length, surrounded with shoals and breakers, on which account it was named the Island of Danger. The reef of rocks which we first saw, when we approached this isle, lies in latitude 10 deg. 15 min. S. and in 169 deg. 28 min. W. longitude; and it bears from this reef W. N. W. distant nine leagues. From the Prince of Wales's Island it bears north 76 deg. 48 min. W. distant nine leagues. As you run in with the land, you see the sands, and about seven leagues off from the most eastern parts of the island, lies a ridge of rocks, near a quarter of a mile in length, and when abreast of these, the island bears W. by N. We failed round the north end, and upon the N. W. and W. side saw innumerable rocks and shoals, which stretched near two leagues into the sea, and were extremely dangerous. But as to the island itself, it had a more beautiful and fertile appearance than any we had seen before, and, like the rest, abounded with people and cocoa-nut trees. The habitations of the natives we saw standing in groups all along the coast. At a distance from this we observed a large vessel under sail. It was with much regret that we could not sufficiently examine this place, which we were obliged to leave by reason of the rocks and breakers, that surrounded it in every direction, which rendered the hazard attending a minute survey, more than an equivalent to every advantage we might procure.

On Sunday the 23d, having still proceeded in our course to the westward, at nine o'clock, P. M. the Tamar, who was a-head, fired a gun, and our people imagined they saw breakers to the leeward; but we were soon convinced, that what had been taken for breakers, was nothing more than the undulating reflection of the moon, which was going down, and shone faintly from behind a cloud in the horizon. We had this day excessive hard showers of rain, on which we seized such a favourable opportunity of filling our casks with a fresh supply of water. This is performed on board of ship, by extending large pieces of canvass in an horizontal position, hanging them by the corners, and placing a cannon ball, or any heavy body in the center; by which means the rain running trickling down to the middle, pours in a stream into the casks placed under. In this manner the Manilla ships, during the long passages they make through the South Seas, recruit their water, from the great showers of rain which at this season of the year fall in these latitudes, for which purpose they always carry a great number of earthen-jars with them. On the 24th, we had moderate fair weather, and at ten o'clock, A. M. we descried another island, bearing S. S. W. distant about seven or eight leagues. We found it to be low, and covered with wood, among which, were cocoa-nut trees in great abundance. But though the place itself has a pleasant appearance, a dreadful sea breaks upon almost every part of the coast, and a great deal of foul ground lies about it. A large lake is in the middle of this island, and it is near 30 miles in circumference. It is about four leagues in length from E. to W. nearly as much in breadth, and lies in latitude 8 deg. 33 min. S. and in 178 deg. 16 min. W. longitude from London. We failed quite round it, and, when on the lee-side, sent our boats out to sound for an anchoring-place. They returned with the unfavourable news that no soundings were to be got near the shore. However, having been dispatched a second time to procure some refreshments for the sick, they landed with great difficulty, and brought off about 200 cocoa-nuts, which to persons in our circumstances, were an inestimable treasure. They found on shore thousands of sea-fowl sitting on their nests,

nefts, and fo divested of fear, that they did not attempt to move at the approach of the seamen, but suffered themselves to be knocked down, having no apprehension of the mischief that was intended them. The ground was covered with land crabs; these were the only animals we saw, nor did we observe the least sign of any inhabitants; and it was supposed never before to have received the mark of human foot steps. The Commodore was inclined to believe, that this island was the same that in the French charts is laid down about a degree to the eastward of the great island of Saint Elizabeth, which is the principal of Solomon's Islands, but being afterwards convinced of the contrary, he named it the Duke of York's Island, in honour of his late royal highness.

On Friday the 28th, we gave up all hopes of seeing Solomon's Islands, which we had expected to visit, and should certainly have found, had there been any such islands in the latitude in which they are placed in our maps. These islands are said to have been discovered by Ferdinand de Quiros, who represented them as exceeding rich and populous; and several Spaniards who have pretended that they were driven thither by stress of weather, have said, that the natives, with respect to their behaviour, were much like those of the continent of America, and that they had ornaments of gold and silver; but though the Spaniards have at different times sent several persons in search of these islands, it was always without success: which must probably proceed, either from the uncertainty of the latitude in which they are said to be found, or the whole being a fiction. There is indeed good reason to believe, that there is no good authority for laying down Solomon's Islands in the situation that is assigned them by the French: the only person who has pretended to have seen them, is the above mentioned Quiros, and we doubt whether he left behind him any account of them, by which they might be found by future navigators. However, we continued our course in the track of these supposed islands, till the 29th, and being then 10 deg. to the westward of their situation in the chart, without having seen any thing of them, we hauled to the northward, in order to cross the line, and afterwards to shape our course for the Ladrone Islands, which though a long run, we hoped to accomplish, before we should be distressed for water, notwithstanding it now began to fall short. This day we observed in latitude 8 deg. 13 min. S. and in 176 min. 20 min. E. longitude.

On Tuesday the 2nd of July, at four o'clock, P. M. we discovered an island bearing north, distant six leagues. We stood for it till sun-set, and then kept off and on for the night. In the morning we found it to be a low flat island, of a most delightful aspect, full of wood, among which the cocoa-nut tree was very conspicuous.

However, we had the mortification to find much foul ground about it, upon which the sea broke with a threatening surf. We steered along the S. W. side of it, which we judged to be about four leagues in length, and soon perceived that it was not only inhabited, but very populous. Immediately about 60 canoes, or rather proas, put off to the ships, none of which had fewer than three, nor more than six persons on board. These Indians had nothing of that fierce disposition, which had, in many instances, totally cut off all friendly intercourse. After gazing at the ships for some time, one of them suddenly sprung out of his proa into the sea, and swam to the Dolphin, then ran up the sides like a cat. He had no sooner reached the decks, than sitting down, he burst into a violent fit of laughter; then started up, and ran all over the ship, attempting to steal whatever he could lay his hands on; but, being stark naked, he was always foiled. A seaman put him on a jacket and trowsers, which caused great diversion, as he displayed all the antics of a monkey. At length he leaped over-board, with his new habiliments, and swam back to his proa. The success of this adventurer encouraged several others to swim to the ship, and whatever they could seize they carried off with astonishing agility. These Indians are tall, well-proportioned, and clean limbed; their skin of a bright copper colour; their features exceeding regular; and their countenances expressing a surprising mixture of intrepidity and cheerfulness. Their hair is black and long, which some wore tied up behind in a great bunch, others in knots: some had long beards, some only whiskers, and some nothing more than a small tuft at the point of the chin. Except their ornaments, they were all stark naked: these consisted of shells very prettily disposed, and strung together, and were worn round their necks, wrists and waists. All their ears were bored, but no ornaments were seen in them; though as the lobes of their ears hung down almost to their shoulders, it is highly probable, that something of considerable weight is at times affixed to them by way of ornament. One man in the group appeared to be a person of consequence; he had a string of human teeth round his waist, which nothing that was shewed him could induce him to part with. Some were unarmed, but others had a very formidable weapon, consisting of a kind of spear, very broad at the end, and stuck full of shark's teeth, which are as sharp as a lancet at the sides, for about three feet of its length. The officers shewed them cocoa-nuts, and made signs that they wanted more; but instead of giving any intimation that their country furnished such fruit, they endeavoured to seize upon those they saw. To this island we gave the name of Byron's Island. It is seated in latitude 1 deg. 18 min. S. and in 173 deg. 46 min. E. longitude.

C H A P. IV.

The two ships depart from Byron's Island—Cross the Equinoctial Line—Arrive at Tinian—Anchor in the very spot where Lord Anson lay in the Centurion—A description of that island, with remarkable incidents and transactions—Observations on the Indians, and the construction of their proas—They sail from the Ladrone Islands—Touch at the isle of Pulo Tinian.—An account of the Malays—Arrive at Batavia—A particular description of the state and situation of this country—Passage from Batavia to the Cape of Good Hope—Observations during our stay there—Set sail and pass the island of St. Helena—The Tamar steers for Antigua in order to refit—And the Dolphin on the 9th of May, 1766, anchor in the Downs.

ON Wednesday the third of July, we sent out the boats to sound, soon after we had brought to off Byron's Island; when returned, they reported, that there was depth of ground at 30 fathom, within two cables length of the shore, but as the bottom was coral rock, and the soundings much too near for a ship to lie in safety, we were obliged to make sail, without having procured any refreshments for our sick. We now steered nearly due north, and crossed the line two degrees beyond the extremity of western longitude from London, or in 178 deg. E. In our course, we saw great quan-

ties of fish, but none could be taken, except sharks, which were become a good dish even at the Commodore's own table.

On Sunday the 21st, all our cocoa-nuts by this time being expended, the men began to fall down again with the scurvy. These nuts had, in an astonishing manner, checked the progress of this dreadful disorder: many whose limbs were become as black as ink, who could not move without the assistance of two men, and who, besides being entirely disabled, suffered excruciating pain, had been in a few days, by eating these nuts,

so far recovered, as to do their duty, and even go aloft as well as they did before they were seized by this distemper. The favourable report which the writer of Lord Anson's voyage had made of Tinian, one of the Ladrões, (a range of islands so named by Magellan, on one of which he lost his life, in an encounter with the natives) induced our Commodore to proceed to so friendly an asylum, as that was described to be, for diseased and exhausted mariners. Accordingly on the 28th, in latitude 13 deg. 9 min. N. and in 158 deg. 50 min. E. longitude; and being now nearly in the parallel of Tinian, we shaped our course for that island. On the 30th we again saw land, which proved to be the islands of Saypan, Tinian, and Aiguigan, which are between two and three leagues distant from each other. On the 31st, we steered along the east-side of them, and at noon, hauling round the south point of Tinian, between that island and Aiguigan, anchored at the S. W. point of it, in 16 fathoms water, on good ground, and in the very spot where Lord Anson lay in the Centurion, in August 1742. As soon as the ship was secured, the Commodore went on shore, to fix upon a place where tents might be erected for the sick, not a single man being at this time free from the scurvy, and many were in the last stage of it; yet not one on board had died since our setting out from England. We found several huts which had been left by the Spaniards and Indians the year before; for this year none of them yet had been at the place, nor was it probable that they should come for some months, the sun being now almost vertical, and the rainy season set in. The Commodore affirmed, that he never felt such heat, either on the coast of Guinea, in the West Indies, or upon the island of St. Thomas, which is under the line. The thermometer which was kept on board the Dolphin, generally stood at 86 degrees, which is but 9 degrees less than the heat of the blood at the heart, and had it been on shore, it would have rose much higher. After a spot had been fixed upon for the tents, six or seven of the men endeavoured to push through the woods, in search of the beautiful lawns and meadows described in Anson's voyage; but the trees stood so thick, and the place was so overgrown with underwood, that they could not see three yards before them; they were therefore obliged to be continually hallooing to each other, to prevent their being separately lost in this trackless wilderness. As the weather was intolerably hot, they had nothing on but their shoes, shirts, and trowsers; and these were soon torn to pieces by the bushes and brambles: at last, however, they got through, with incredible labour and difficulty; but found the lawns entirely overgrown with a stubborn kind of reed or brush, in many places higher than their heads, and no where lower than their middles, which continually entangled their legs, and cut them like whiplcord. During this excursion, they were covered with flies from head to foot; and whenever they offered to speak, they were sure of having a mouthful, many of which never failed to get down their throats. After having walked three or four miles they saw a bull, which they killed, and a little before night got back to the beach, as wet as if they had been dipt in water, and so fatigued, that they were scarce able to stand.

On Thursday the 1st of August, a party was dispatched to fetch the bull, and our people were employed in setting up more tents. As the Commodore himself was very ill of the scurvy, he ordered a tent to be pitched for himself, and took up his residence on shore, where we also erected the smith's forge, in order to repair the iron work of both ships. We were likewise employed in getting the water casks on shore, and clearing the well at which they were to be filled. This well we thought to be the same the Centurion watered at, but it was the worst we had met with during the voyage, for the water was not only brackish, but full of worms. Also the road where the ships lay was a dangerous situation at this season, for the bottom is a hard sand, and large coral rocks, and the anchor having no hold in the sand, is in perpetual danger of being cut to pieces. We did not perceive these disagreeable circumstances

when we first cast anchor, thinking then the ground to be good; but finding the contrary after having moored, to prevent any bad consequences, we rounded the cables and buoyed them up with empty casks. Afterwards finding the cables much damaged, we resolved to lie single for the future, that by veering away, or heaving in, as we should have more or less wind, we might always keep them from being slack, consequently from rubbing, and this expedient succeeded to our wish. At the full and change of the moon, a prodigious swell tumbles in here; and it once drove in from the westward with such fury, that we were obliged to put to sea for a week; for had our cable parted in the night, and the wind been upon the shore, which sometimes happens for two or three days together, the ship must inevitably have been lost on the rocks. Thus had we arrived at this delightful island, after a passage of four months and twenty days, from the Straits of Magellan, with this surprising and happy circumstance, that during this long run, though many had great complaints of the scurvy, from the salt provisions they had been obliged to live upon, yet through the care of the Commodore, in causing the people to be supplied at stated times with portable soup, and the refreshments we had obtained from several islands, we had not buried a single man; and we had now, by being favoured with fair weather, an opportunity of sending our sick on shore, into the tents, which some of our men had soon prepared for their reception. But while we stayed here two died of fevers; and in the Commodore's opinion, from the almost incessant rains, and violent heat, during the season we were here, this beautiful and fertile island is one of the most unhealthy spots in the world. We frequently dispatched parties into the woods in search of cattle, which, from the account published in the history of Commodore Anson's voyage, we expected to find in numbers; but to our disappointment, a few only were discovered at a great distance from the tents, so very shy, that it was difficult to get a shot at them; and more so to drag them six or seven miles to the tents, the woods and lawns which we have already described, being so thick, as greatly to obstruct our passage: for though the beasts themselves had made paths through these woods, we could not proceed in them without the greatest difficulty. During the first week we killed only three white bullocks, one of which our men could not bring down to the shore, before it was covered with maggots, and stunk most intolerably: nor was this the worst; for the sailors suffered such inexpressible fatigue as frequently brought on fevers, occasioned by the warmth of the climate, the prodigious number of flies by day, and the musquitoes by night: these last resemble our gnats in England, but are larger, more numerous, and much more troublesome. They were also in their march much embarrassed with centipeds, scorpions, and a large black ant, little inferior to either of them in the malignity of its bite. We had also to encounter with an innumerable number of other venomous insects, altogether unknown to us, by which we suffered so severely, that many were afraid to lie down in their beds: nor were those on board in a much better situation than those on shore; for numbers of these tormentors being conveyed to the ship by the wood, they took possession of every birth, and left the poor seamen no place of rest either below or upon the deck.

On Wednesday the 7th, we sent on shore to the tents, which was called the hospital, 16 of our ship's company; and the next day John Watson, our quarter-master, departed this life; and soon after died Peter Evans, one of the seamen belonging to the Tamar. This day we got our copper oven on shore, and baked bread, which we served to the sick; the whole being under the inspection of the surgeon. Poultry we procured upon easy terms, for the birds were in great plenty, and easily killed; but the flesh of the best of them was very ill tasted. Our principal resource for fresh meat was the wild hog, with which the island is well stocked. These animals are exceeding fierce, and a carcass of some of them frequently weighed 200 weights. They were killed without

much trouble, but a black belonging to the Tamar contrived a method to ensnare them, so that we took great numbers of them alive, which was an unspeakable advantage. But being very desirous of procuring some beef in an eatable state, with less risk and labour, we sent a boat, upon the information of Mr. Gore, to the N. W. part of the island, where the cattle were very numerous. A party was also sent with a tent for their accommodation, who shot them; and they were immediately killed, cut up, and conveyed to the boats: however, sometimes such a sea broke upon the rocks that it was impossible to approach them, and the Tamar's boat lost three of her best men by attempting it.

This island of Tinian is situated in 15 deg. 8 min. north latitude, and 114 deg. 50 min. west longitude from Acapulco, in New Spain; and is 12 miles in length, but only half as much in breadth. It produces limes, four oranges, cocoa-nuts, bread-fruit, guavas, and paupaws in abundance; but we found no water-melons, scurvy-grass, or sorrel. The cocoa-nut, which we have so often mentioned in describing the new discovered islands, is one of the most beautiful, as well as the most admirable, of all the vegetable productions, and is also found in many other parts of the world, particularly in the East and West Indies. It is a species of the palm. The trunk is large, straight, and insensibly grows smaller from the bottom to the top. On the upper part of the trunk are the branches, which form a beautiful head. The fruit hangs in branches by strong stalks; some of which are always ripe, others green, and some just beginning to button, while the blossoms, which are yellow, are still in bloom. The fruit is of different sizes, and of a greenish colour: it is covered with two rinds, the outer composed of long, tough, brown threads; but the second is extremely hard, and has within it a firm white substance, in taste nearest to that of a sweet almond. The people of several countries eat it with their meat as we do bread, and squeeze out of it a liquor that resembles almond-milk, which on being exposed to the fire, is converted into a kind of oil, that is used both in sauces and in lamps. In the middle of the nut is also a considerable quantity of a clear cool liquor, that has the taste of sugar-water, and when drank is very refreshing. What is called the cabbage consists of a cluster of many white, thin, brittle flakes, which have somewhat of the taste of almonds, and, when boiled, has a resemblance to the taste of an English cabbage, but is sweeter and more agreeable. But the most remarkable fruit of this island is the bread-fruit, it being generally eaten by the Europeans who come here instead of bread, to which it is even preferred. It grows upon a lofty tree, which, near the top, divides into spreading branches, covered with leaves of a deep green colour, notched on the edges, and from 12 to 18 inches in length. The fruit which grows single on all parts of the branches, is seven or eight inches long, of an oval form, and covered with a rough rind, and when gathered green, and roasted on the embers, has its inside soft, tender, white, and crumby like bread. Its taste comes nearest to that of an artichoke's bottom. This excellent fruit is in season eight months in the year. As it ripens it turns yellow, and growing softer, has the taste of a ripe peach, and a fragrant smell, but is then said to be unwholesome, and apt to produce the flux. The fish, however, caught about this coast appear to be unwholesome. Some of our officers after having eaten a dish of fine looking fish, were taken ill with a violent purging and vomiting, which had like to have been attended with fatal consequences. Mr. Walter in his history of Commodore Anson's voyage, observes, that the few they caught at their first arrival, had surfeited those who eat of them, and therefore the people on board the Centurion thought it most prudent to abstain from fish. This observation, added to our own experience, is a sufficient proof of their being prejudicial. Indeed, at first, from taking the word surfeit in a literal sense, we concluded, that those who tasted the fish, when the late Lord Anson came hither, were made sick

merely by eating too much of them; from which supposition we were led to think, that there could be no reason for a total abstinence with respect to this kind of food, but only a caution to eat with temperance. However, we were soon made wiser by experience; for though all our people eat sparingly of this fish by way of experiment, nevertheless all who tasted them were soon afterwards dangerously ill. Besides the above mentioned fruit, this island produces cotton and indigo in abundance, and would certainly be of great value if it was situated in the West Indies. The surgeon of the Tamar, an ingenious and very judicious gentleman, enclosed a large spot of ground here, and made a very pretty garden; but our short stay would not permit us to derive any advantage from it. However, amidst such plenty we enjoyed, the want of its produce might very well be dispensed with.

It is surprizing that an island thus abounding with the necessaries and luxuries of life, should be destitute of inhabitants, but it seems it was once populous; and that an epidemical sickness having carried off multitudes of the inhabitants of this and the neighbouring islands, the Spaniards removed the rest to Guam, to supply the numbers that had died there, where languishing for their native soil, and their former habitations, the greatest part of them died with grief. Indeed we saw the ruins of their deserted town, which is now over-grown with trees and bushes. But though Tinian is uninhabited, the Indians of Guam, and other of the neighbouring islands, frequently resort thither to jerk beef, and carry it away. These Indians are a bold, strong, well limbed people; and if we may judge from the admirable structure of their flying proas, the only vessels they use at sea, they are far from being deficient in point of understanding. These vessels move with such amazing swiftness, that it is generally allowed by all who have observed them with attention, that they will run at least 20 miles an hour. The construction of these proas is very remarkable, the head and stern being exactly alike; but the sides very different, that intended for the windward side being built rounding, while the lee-side is flat. The body is formed of two pieces joined end ways, and neatly sewed together with bark: and as the strait run of her leeward side, and her small breadth, would certainly cause her to overfet, a frame called an out-rigger, is laid out from her to the windward, to the end of which is fastened a log, made hollow, in the shape of a small boat: thus the weight of the frame balances the proa, and that, with the small boat, always in the water, prevents her overfetting to the windward. The vessel generally carries six or seven Indians, two of whom sit in the head and stern, who steer the proa alternately, with a paddle, according to the tack she goes on; he in the stern being the steersman; the rest are employed in setting and trimming the sail, or bailing out the water she may accidentally ship. Thus by only shifting the sail, these vessels with either end foremast, can, with astonishing swiftness, run from one of these islands to another, and back again, without ever putting about. While we lay at this place, the Tamar was sent to examine the island of Saypan, which is much larger than Tinian, rises higher, and has a much pleasanter appearance. The Tamar anchored to the leeward, at the distance of a mile from the shore, and in 10 fathom water, with much the same kind of ground as we had in the road of Tinian. Some of the Tamar's company landed upon a fine sandy beach, which is six or seven miles long, and walked up into the woods, where they discovered many trees very fit for top masts. They saw no fowls nor any tracks of cattle, but plenty of hogs and guanoes: also large heaps of pearl oyster-shells thrown up together, and other signs of people having been there: possibly the Spaniards may go thither at some seasons of the year, and carry on a pearl fishery. As we shall have an opportunity of again mentioning these places in our accounts of other voyages, we here, for the amusement of our numerous subscribers, insert what other navigators, and judicious writers, have related both of the Philippine and Ladrone Islands, both situated in the

the Pacific Ocean, and at no great distance from each other.

An account of the Philippine, and Ladron, or Marian Islands.

THE Philippine Islands are situate in the Chinese Sea, part of the Pacific Ocean, between 114 and 130 degrees of eastern longitude, and between 5 and 19 degrees of north latitude, about 100 leagues S. E. of China. There are 1100 of them, and several very large. The chief of the most northerly of them is Masila or Luconia, which is the largest of the Philippines, and is situate in 15 deg. of north latitude, being about 400 miles long and above 180 broad in most places.

The capital of this island, and of all the rest, is the city of Manila, situate on a bay in the S. W. part of the island, being two miles in circumference, surrounded by a wall and other works, a very commodious harbour, but of difficult access, on account of the rocks and sands which lie before it; a castle defends the entrance.

The chief buildings are the cathedral, parish churches and convents; one of the religious houses is appropriated to the support of orphans, daughters of the inhabitants, who are provided for during their lives; or, if they chuse to marry, have a portion of two or three hundred crowns given them. Their churches, chapels, and altars, are richly adorned, and their processions on holidays as splendid as in Spain. The college of the jesuits here, as in most Popish countries, is more magnificent than any of the rest.

The island of Luconia, or Manila, is esteemed healthful, and the water in it the best in the world. It produces all the fruits of warm climates, and has an excellent breed of horses carried thither from Spain. It is well situated for the Indian and Chinese trade; and the bay and port, which lies on the west-side of it, is a large circular basin of 10 leagues diameter, entirely land-locked. The city of Manila, which stands on the east-side, is large and contains several spacious streets and grand houses; and at the beginning of the first war with the Spaniards, in the reign of king George II. was an open place, only defended by a little fort; but considerable additions have lately been made to its fortifications. The port peculiar to the city is that of Cabite, which lies two leagues to the southward, and here the ships employed in the Acapulco trade are stationed.

The city is healthfully situated, and well watered, and has a very fruitful country in its neighbourhood; but it is some disadvantage to its trade, that it is difficult getting out to sea to the eastward, through such a number of islands: here the Spaniards waste abundance of time, and are often in great danger.

The trade from hence to China and India consists chiefly in such commodities as are intended to supply Mexico and Peru, namely, spices, Chinese silks, and manufactures, particularly silk stockings, of which no less than 50,000 pair have been shipped in one cargo, with vast quantities of Indian stuffs, calicoes and chints, which are much worn in America, together with other small articles, such as goldsmiths-work, &c. wrought at the city of Manila by the Chinese, of which nation there are not less than 20,000 residing there, as servants, manufacturers, or brokers. All these articles are transported annually to the port of Acapulco in Mexico: this trade is not open to all the inhabitants of Manila, but is restrained to the convents of Manila, principally to the jesuits, being a donation to support the missions for the propagation of the Catholic faith. The tonage of each ship is divided into a certain number of bales, all of the same size; and the convents have a right to embark such a quantity of goods on board the Manila ships as the tonage of their bales amount to. The trade is limited by royal edicts to a certain value; according to some, it should not exceed 600,000 dollars; but it is frequently known to amount to three millions.

The bulk of the people of Manila are of Chinese or

Malayan extraction, and there are some blacks. The Spaniards, though fewest in number, have the government in their hands. The adjacent country is full of fine plantations, farms, and country-houses of the principal inhabitants. Upon the mountains, in the middle of the country, the people live in tents and huts, under the spreading trees. The plains are overflowed in the rainy season, the houses built upon high pillars; and the people have no communication but by boats during the rains, which usually fall in June, July, August, and September, and then happen terrible storms of wind and thunder. Earthquakes are frequent; the city of Manila has suffered several times by them; and from the volcanoes, which abound here, issue torrents of fire and melted minerals. These are the inconveniences we meet with; but the fair season is for the most part exceedingly pleasant.

The city of Manila contains about 3000 inhabitants; and during the second war in the reign of king George II. was in the year 1763, taken by admiral Cornish and Sir William Draper. It was, however, stipulated to be ransomed; but the ransom-money hath never yet been entirely discharged. The priests take prodigious pains to make converts to the Romish faith, and have been pretty successful in their endeavours. The Indians pay a poll-tax; and a considerable sum of money is annually allowed for the support of female orphans, both of Spanish and Indian parents.

The complexions of the several people who inhabit these islands are very different. The blacks are as black as the Caffres of Africa, but differ from them in their features and long hair, and therefore are supposed to be of Indian extraction; and as they possess the mountainous and inaccessible parts of the country, it is conjectured, that they were the original inhabitants, and driven up thither by succeeding adventurers.

The descendants of the Malaysians (inhabitants of Malacca) are very tawny, the Chinese not so dark, and the Spaniards are pretty near the colour of the Chinese. There is also a nation of painted people, called Pintados, who colour their skins like our ancestors the Piets.

The natives are for the most part of a moderate stature, and their features just; the Spaniards have taught them to cloath themselves, except the blacks, who only tie a cloth about their loins, and another about their heads, and usually go bare-foot.

Rice and fish are most eaten by those who live near the sea-coasts, and the mountaineers eat the flesh they take in hunting, and the fruits of the earth, which grow spontaneously in great plenty. Their liquor is water, which they usually drink warm as the Chinese do. They have also palm-wine, and spirituous liquors distilled from the juice of the sugar-cane, rice, &c. They bathe twice a day in cold water, either for health or diversion, or both: plays are another diversion, and they are entertained frequently with dancing and mock fights.

These islands are extremely well situated for trade; all the rich merchandize of India is sent from hence to America, and the treasures of Mexico and Peru are brought hither annually, by which exchange, it is said, they make a profit of 400 per cent.

Few countries enjoy a more fruitful soil; the people in many places live upon what the earth produces spontaneously, and the surface of the ground is exceeding beautiful; the trees are ever green, and seldom without fruit.

Their neat cattle run wild in the mountains, and are hunted, as well as deer, wild hogs and goats. The monkeys and baboons found here are very sagacious: during the season, when there is no fruit to be got, they go down to the sea-side to catch oysters; that the fish may not pinch their paws, they put a stone between the shells, to prevent their shutting close. Wax is so plentiful, that they make no other candles, and never burn lamps. Their bees are of several kinds, some of them very large, and make their combs in the woods, producing such quantities of honey as would almost sub-

Medicinal

Medicinal and sweet gums, issuing from the bodies of trees are part of the produce: serpents of various kinds are found in these islands; but the fathers who relate that some of them are so large, they will swallow a stag, horns and all, surely do not expect to be believed, any more than when they relate, that the leaves of trees are converted into insects; but the last of these stories may proceed from a mistake, for it is certain that some insects deposit their eggs (as they do with us) upon the leaves of trees, which are hatched there, as is the case of the cochineal fly; and they might ignorantly imagine that those insects proceed from the leaf. The alligators are very dangerous; and the ignana, a kind of land alligator, does a great deal of mischief. Among their birds, are peacocks, parrots, cocatoos, and turtle-doves, which are very beautiful, fowls with black bones, and the bird tavan, which lays a number of eggs in trenches in the sand, and leaves them to hatch there. The saligan fastens her nests to some rock, as a martin does against a wall, which dissolving into a kind of jelly in warm water, is esteemed delicious food. Here is also the xolo bird, which eats like a turkey; the camboxa is a well tasted fowl peculiar to these islands. The herrero or carpenter, is a fine large green bird. It is called the carpenter, because its beak is so hard, that it digs a hole in the trunk, or some large branch of a tree, in order to build its nest.

Their fruits are mangoes, plantains, bananoes, cocoas, tamarinds, cassia, and the cocoa or chocolate nut, which has been brought over from Mexico; oranges, lemons, and all manner of tropical fruits. The cinnamon and nutmeg-tree have been planted here; but degenerate, and are good for little.

A great deal of good timber and dying woods grow in these islands; and the calamba, or sweet-wood, a kind of cane, grows in the mountains, which, if cut, yields a draught of water, and is of great service to the natives.

They have one plant that has all the properties of and is used as a substitute for opium; of this the natives are very fond, and frequently intoxicate themselves with it.

Flowers and sweet-herbs grow wild here, but they do not cultivate them in their gardens, and there are abundance of medicinal, as well as poisonous herbs and flowers, which do not only kill those that touch or taste them, but so infect the air, that many people die in the time of their blossoming: on the contrary, these islands are providentially well furnished with antidotes, particularly the bezoar stone, which is found in the belly of a creature much like a deer; and the root dilao, which is like ginger, and heals wounds made by any venomous beast, being bruised and boiled with oil of cocoas.

The tree camondog is so venomous, that the pilchards eating the leaves which fall into the sea die; as will the persons who eat the poisoned fish. The liquor which flows from the trunk of this tree serves these people to poison the points of their darts which they blow through the trunks abovementioned: the very shadow of the tree is so destructive, that, as far as it reaches, no herb or grass grows, and if transplanted, it kills all the other plants it stands near, except a small shrub which is an antidote against it, and always with it: a bit of a twig of this shrub, or a leaf carried in a man's mouth, is said to be a security against the venom of the tree, and therefore the Indians are never without it.

The maka bukay, which signifies the giver of life, is a kind of ivy which twines about any tree, and grows to the thickness of a man's finger; it has long shoots like vine branches, of which the Indians make bracelets, and esteem them a preservative against poison. There are many other trees and plants of extraordinary virtue in these islands; among others, there is the sensitive plant, in all respects like a colewort, which growing out of a rock, avoids the touch, and retires under water: there is another that grows on St. Peter's Hill about Manila, which is not very tall, and has little leaves, which whenever it is touched, draws back and closes all its leaves together, for which reason the Spaniards call it la vergin cosa, that is, the bashful.

There grows near Cathalagan, in the island of Samar, a plant of a surprising virtue, discovered by the fathers of the society, as they tell us, of late years: the Dutch have also some knowledge of it, and, it is said, will give double the quantity of gold for it. The plant is like ivy, and twines about any tree it grows near: the fruit which grows out of the knots and leaves resembles a melocotoon in bigness and colour, and within has eight, ten, or sixteen kernels as big as a hazel nut, each green and yellow, which when ripe, drop out of themselves.

The usual dose given of it is the weight of half a royal, that is the sixteenth part of an ounce, powdered and mixed in wine or water; if it has no effect the first time, the dose is repeated, and is a powerful antidote against any poison, either of venomous herbs or darts which are used by the natives of Macassar, Borneo, and the Philippines.

The general language spoken in these islands is the Malayan tongue; besides which, every people have a language peculiar to themselves. They write on cocconut leaves, with an iron style or pen; and arts and sciences have been introduced by the Spaniards, the natives having nothing of this kind to boast of before their arrival.

All these islands, except Mindanæo and Paragoo, are under the jurisdiction of a Spanish vic roy, who has governors under him in every other island and town of consequence, and the like courts are erected for the trial of civil and criminal causes, as in old Spain. The archbishop of Manila, the bishops and their commissaries, determine ecclesiastical causes as in Europe; but there lies an appeal from them to the pope's delegate, who resides in one of the islands. The court of inquisition has also a commissary here. But notwithstanding the Spaniards are represented as sovereigns of these islands, this must only be understood of the open country and the sea-coasts, in which there may be 300,000 souls: but these are not a tenth part of the inhabitants, the rest look upon themselves as a free people: every mountain almost is possessed by a different tribe, who make war upon one another, the Spaniards seldom intermeddling in their quarrels. The Chinese were formerly so numerous here, that they disputed the authority of the Spaniards over them: it is computed that 40,000 of them resided in and about the city of Manila; but the Spaniards compelled them to submit, and banished some thousands of them, the rest were permitted to remain here, to carry on their manufactures; for they are almost the only artificers.

Their arms are bows, arrows, and lances or spears, broad swords, and tubes or trunks, through which they blow poisoned arrows, the slightest wounds whereof are mortal, if immediate remedies are not applied. They have cane shields also covered with a buffalo's hide, and a head-piece for defensive arms.

These savages, as the Spaniards call them, worship one supreme God, and their ancestors, as the Chinese do, from whom most of them are descended; they worship also the sun and moon, and almost every thing they see, whether animate or inanimate, groves, rocks, rivers, and one particular tree, which they would esteem it a sacrilege to cut down, believing the souls of some of their friends may reside in it, and that in cutting the tree they may wound a near relation. Instead of temples, they have caves, wherein they place their idols, and sacrifice to them. Some beautiful young virgins first wounds the victim with a spear, and then the priests dispatch the animal; and, having dressed the meat, it is eaten by the company. Superstition prevails among them; they have their lucky and unlucky days; and if certain animals cross the way when they are going upon business, they will return home, and go out no more that day. The Spaniards tolerate them in their idolatrous worship; and suffer them to game, on paying to the government 10,000 crowns per annum. They are also much given to a detestable vice: and did not imagine it to be a crime, till the Spaniards punished them for it.

The men purchase their wives here as in China; and the marriage ceremony is performed by a priestess, who sacrifices

sacrifices some animal on the occasion; after which, the bride is led home, and the whole concludes with an entertainment as at other places. They marry in their own tribe, and with their nearest relations, except the first degree; some of them are confined to one wife, other tribes allow a plurality of women, and divorces for reasonable causes on either side. Children are either named after heroes or flowers, or from some accidental circumstance that occurs at the time of their birth; but as soon as they marry, they chuse new names, and their parents are obliged to make use of their old ones.

The dead are washed and perfumed, wrapped in silk, and put in a close coffin, near which a chest is placed that contains the arms of a man, or domestic utensils of a woman: mourners are hired to assist in making a dismal noise. They bury their dead as in China, and do not burn them: as soon as the body is buried, an entertainment is made, and all is converted to mirth and festivity. In general, they mourn in black garments; and shave their heads and eye-brows.

The next Spanish island to that of Manila is Samar or Philippina, between which and Manila is a narrow channel, called the Straight of Manila, the N. E. point whereof is called Spirito Sancto; the island is near 400 miles in circumference, the chief town, Cautalagan, governed by a Spanish alcade. The island of Sebu, which lies in 10 deg. S. latitude, is the place where Magellan first set up the Spanish colours; the chief town named Nombre de Dios, afterwards made a bishop's see, has in it a cathedral and several other churches and monasteries. The island of negroes lies west of Sebu, and was so named because it is inhabited chiefly by blacks. Mindanao lies the most southerly of any of the Philippine Islands, and is the largest of them except Manila, being near 200 miles in length, and 150 in breadth. It is possessed by people of different nations and different religions; but the Mahometans, who are situate on the sea-coasts, are much the most numerous, whose sovereign is stiled Sultan of Mindanao. Those who possess the middle of the island are called Hillanons, and another nation stiled Solognes, are situate on the N. W. coast. The air of this island is not so hot as might be expected, being refreshed frequently by the sea breezes, and the periodical rains, which lay the flat country under water. The winds blow from the east, from October to May, and then turn about and set westerly; next month the rains and storms succeed; at first there are not more than two or three showers a day; they afterwards come oftener, with violent hurricanes and loud thunder, and the wind continues westerly until November, during which time they have such storms that trees are blown up by the roots, the rivers are overflowed, and they do not see the sun or stars sometimes in a week: about August the air is very cool, the rain and wind are moderate in September, and in October the wind blows from the east again, and it continues fair till April, and sometimes May.

Mindanao, the capital city, lies on the south-side of the island, in 123 deg. 15 min. of eastern longitude, and 6 deg. 20 min. north latitude, near the mouth of a river, and about two miles from the sea; the houses being built on bamboo pillars, 16 or 18 feet above the surface of the ground, on account of the annual floods, when they have no communication with one another but by boats. The city is about a mile in length, built along the winding bank of the river; the Sultan's palace is supported by 180 trees, and has 20 cannon mounted in the front; and several of the nobility have great guns in or before their houses. Large ships cannot come up to the town, there being scarce 11 feet water on the bar, at the entrance of the river.

The natives are held to be men of a sprightly genius, but very lazy and indolent, and will rather thieve than work; but none are more active when they find there is a necessity for it; and there may be two reasons for their lazy disposition, one from the heat of the climate, and the other from the tyranny of the government, no man being sure he shall enjoy what he acquires by his industry.

The Mindanayans are of a low stature, and very slender, of dark tawny complexions, black eyes and hair, flat faces, short noses, wide mouths, and black teeth, which they take abundance of pains to dye of that colour; and they wear the nails of their left hands almost as long again as their fingers, scraping and dyeing them with vermillion.

The men have a haughty mein, and yet are said to be very complaisant to foreigners, unless they are insulted, and then they seldom fail to resent the affront, and destroy their enemy by poison or a dagger, never hazarding their persons in a duel.

Their habit is a linen frock and drawers, and a small piece of linen cloth, tied about their heads, but they go bare-foot: the complexion and features of the women are better than those of the men; but yet they too much resemble the other sex, and cannot be admired for their beauty; they wear a frock like the men, and a piece of cloth round their waists; the sleeves of the frock being large, and coming down to their wrists. Their hair is tied up in a roll at the hinder part of their heads. The men shave their heads, all but a lock that is left in the middle of the crown, like other Mahometans; their beards are very thin, being pulled up by the roots with tweezers. People of figure are clothed in silk or fine callico; the women go bare-foot as well as the men, and adorn their arms and fingers with bracelets and rings. They are not restrained from conversing with their countrymen or foreigners.

The food of people of condition is flesh, fish, and fowl of all kinds, except hogs flesh, which the Mahometans never touch. The poorer sort content themselves with rice and sago. Rice is the principal part of the meal with all of them; they take it up with their hands, using neither knives or spoons; and their meat, whatever it be, is boiled to rags, that it may very easily be pulled to pieces with their fingers. They usually drink water, but make a pretty strong liquor with plantains; they wash before and after every meal, and bathe several times a day. Swimming is one of the chief diversions of the women, as well as the men, to which they are used from their infancy.

Upon joyful occasions the dancing girls, as they are called, are sent for to divert the company; but this dancing consists only in skewing themselves into lascivious postures, and addressing their great men with flattering speeches. They have plays and mock fights also acted before them, and hunting of wild beasts is their principal rural sport, in which their women partake; but their hunting is only driving the deer and other game into an inclosure, from whence they cannot escape, and then shooting at them.

Mindanao is a fruitful soil, well watered with rivers, and their mountains afford excellent timber. Of the libby, or sago-tree, there are large groves: the sago is the pith of a tree which the natives eat instead of bread, and is frequently brought over to Europe, being so grained, that it is sometimes taken for a seed. They have no corn but rice. Plantains, guavas, mangoes, and all tropical fruits, abound here. Cloves and nutmegs have been transplanted hither, and appear fair to the eye; but it is said they degenerate, and the fruit is good for nothing: if these plants were cultivated, possibly they might equal those of the spice islands.

Here are no beasts of prey in this island, but almost every other useful animal, such as horses, cows, buffaloes, and hogs, with bunches over their eyes; here are also snakes, scorpions, and other venomous insects; and the feathered kind are the same as in Manila.

The Malayan language is generally spoken here; and the Mahometans have the koran and books of devotion, in the Arabic language. The liberal arts do not flourish here; they are forced to employ the Chinese to keep their accounts for them; nor have they so much as a clock or a watch in all the country, but beat upon drums every three hours, that people may know the time of the day. There are scarce any

any other working trades, except goldsmiths, carpenters, and blacksmiths, who perform their work very well with the tools they have, for the smiths have neither vice nor anvil, nor the carpenters any saws, but when they have split their planks, plane them with the ax or adze. Their diseases are fluxes, fevers, and the small-pox; and some are affected with a kind of leprosy, or dry scurf, which covers the body, and itches intolerably.

The religion of the sultan, and those who inhabit the sea-coasts, is Mahometanism, and that of the inland people is Paganism, differing little from the Chinese. In allowing a plurality of wives and concubines, the Mahometans of this island imitate those of Turkey, only they allow their women greater liberties, suffering them to converse freely with their acquaintance or strangers; but it is said they are so prejudiced against swine's flesh, that one of their great men refused to wear a pair of shoes made by an European, when he was informed that the threads with which they were sewed were pointed with hogs' bristles. They look upon themselves to be defiled, if they touch any thing which belongs to a hog; they durst not kill them lest they should be defiled by the touch of the weapon they make use of, which occasions these animals to multiply so fast, that the island is over-run with them. They are very glad to see the Europeans kill them, but must undergo several ablutions or washings, if they should happen to touch a man that had eaten its flesh.

The sultan of Mindanao is an absolute prince, and his throne hereditary; both the persons and purges of his subjects are in his power, and if he knows any of them abound in wealth, he borrows it of them. He has one great minister, in whom he lodges the administration of the government, both civil and military, to whom both natives and foreigners must apply themselves for liberty to trade. Their wars are chiefly with the mountaineers, who inhabit the middle of the island, with whom they are very cautious of coming to a general engagement; but when the armies are pretty near, they begin to entrench and cannonade each other, and will remain in the same camp some months, sending out parties to make incursions into the enemies' country, and surprize defenceless places. Their arms are a crice or short dagger, and a broad sword, a spear, and bows and arrows.

The most considerable of the Philippines that have not been mentioned, are Mindora, S. W. of Manila; Panay, and Leyte, which lie north of Mindanao; and the island of Paragoa, which lies very near the north part of Bornco, and is subject to one of the princes of that island.

Philippina was the first that was discovered of this cluster of islands, and consequently gave name to the rest. It lies between 12 and 14 degrees north latitude, and is the most fertile and pleasant of all the Philippines, exhibiting a scene of perpetual verdure; for here the sun is powerful, without being disagreeable.

The Ladrone Islands are situate in the Pacific Ocean, in 140 degrees of eastern longitude, and between 12 and 28 degrees of north latitude. Guam or Ignana, the largest, is situate in 13 deg. 21 min. north latitude, 7300 miles west of Cape Corientes in Mexico, according to Dampier. The other inconsiderable islands are, 2. Sarpanta. 3. Bonavista or Tinian. 4. Sefpara. 5. Anatan. 6. Sarignan. 7. Guagam. 8. Alama-guan. 9. Pagon. 10. The burning mountain of Griga. 11. Magna. 12. Patas. 13. Disconocida; and, 14. Malabrigo.

Guam is about 12 leagues long and four broad, lying N. and S. It is pretty high champaign land, sloping down towards the coast. The east-side, which is the highest, is fenced with steep rocks, on which the waves constantly beat, driven by the trade wind. The west-side is low land, in which are several little sandy bays divided by rocks.

The natives of Guam are of a good stature, have large limbs, a tawny complexion, black long hair, small

eyes, thick lips, and are long visaged. They are sometimes afflicted with a kind of leprosy, otherwise the country is healthful, especially in the dry season. The rains begin in June, and last till October, but are not violent.

The island produces rice and most tropical fruits, and one sort, which Dampier has named bread-fruit, grows upon a tree like apples, and at its full bigness is as large as an ordinary foot-ball; it has a hard thick rind, and within a soft yellow pulp, of a sweetish taste; the natives eat it instead of bread, having first baked or roasted it in the embers: it is in season eight months in the year, and grows only in these islands.

Dampier relates, that when he was there (about the year 1700) there were not above 100 Indians upon the island, though he was informed there had been 3 or 400 sometime before: and the reason given why there was no more at that time was, because most of them had burnt their plantations, and fled to other islands on their being used ill by the Spaniards.

Their swift-failing sloops, or flying proas, are the admiration of all that see them; the bottom of the vessel, or the keel, is of one piece, made like a canoe, 28 feet in length, built sharp at both ends, one side of the sloop flat, and the other rounding with a pretty large belly; being four or five feet broad, with a mast in the middle. They turn the flat side to the wind, and having a head at each end, sail with either of them foremast, and have never any occasion to tack. Dampier computed they would sail 24 miles an hour. The tide never rises above two or three feet at this island.

The writer of Lord Anson's voyage relates, that they arrived at the island of Tinian or Bonavista, one of the Ladrone Islands, which lies north of Guam, on the 27th of August, 1742, being situated in 15 deg. 8 min. north latitude, and 114 deg. 50 min. west of Acapulco in America. This island is 12 miles in length, and six in breadth, extending from the S. S. W. to N. N. E. The soil is dry and sandy, and the air healthful; the land rises in gentle slopes from the shore to the middle of the island, interrupted by valleys of an easy descent. The valleys and gradual swellings of the ground are beautifully diversified by the encroachments of woods and lawns; and the woods consist of tall spreading trees, celebrated for their aspect or their fruit; the turf of the lawns clean and uniform, composed of fine trefoil, intermixed with a variety of flowers; the woods, in many places, open, free from bushes, and under-wood, affording most elegant and entertaining prospects.

The cattle on this island were computed to amount to 10,000, (we suppose he means horned cattle) all perfectly white except their ears; besides which there were hogs and poultry without number. The cattle and fowls were so fat, that the men could run them down, and were under no necessity of shooting them. Their flesh is well tasted, and very easy of digestion.

About the beginning of the present century, this island was said to contain at least 30,000 inhabitants, when a dreadful mortality raging among them, prodigious numbers died, and the calamity prevailing with equal violence in the islands of Rota and Guam, the Spaniards obliged those that remained at Tinian to remove to Guam, in order to make good the deficiency by the number of the souls that had perished in that island; since which time, Tinian has been wholly uninhabited. The ruins of the buildings in Tinian, some of which are of a particular form, evince it to have been once a populous place. The island of Rota has not any thing in it that demands particular attention. Its chief produce is rice, which is cultivated by a few Indians, who live there undisturbed, but are subject to the Spaniards' governor.

Though the other islands are uninhabited, they are in general exceeding fertile, the air good, and the climate temperate. They also produce plenty of provisions; but they are seldom visited, on account of the great inconvenience arising from the want of water for anchor-
age.

age. Tinian is more commodious in this particular, but even there it is very unsafe from June to October. In the month of September, the Tamar, one of Commodore Byron's ships, met with an accident, that was attended with fatal consequences to two of her best seamen; she had, as usual, sent her boat on shore, when the surf suddenly rose so high as to fill the boat with water, by which means the men were dashed against the steep craggy rocks near the shore, and two of them drowned; and the rest who were six in number, with great difficulty escaped suffering the same fate, by swimming to shore, they being frequently repelled by the unusual swell which prevailed at that time.

Several other islands have lately been discovered to the eastward of the Philippines; and from them called the New Philippines, of which father Clan, in a letter from Manila (inserted in the Philosophical Transactions) gives the following account: that he happening to be at the town of Guivana, in the island of Samar, found 29 palars, or inhabitants of certain newly discovered islands, who were driven there by the easterly winds which blow in those seas from December to May. They had run before the wind for 70 days together, according to their own relation, without being able to make any land till they came in sight of Guivam: they were 35 persons, and embarked in two boats, with their wives and children, when they first came out, but several perished by the hardships they underwent in the voyage; they were under such a consternation when a man from Guivam attempted to come on board them, that all the people which were in one of the vessels, with their wives and children, jumped over board; however, they were at length persuaded to steer into the harbour, and they landed the 28th of December, 1696. They eat cocoa-nuts and roots which were brought them very freely, but would not touch boiled rice, the common food of the Asiatics. Two women, who had formerly been cast on shore from the same islands, were their interpreters; they related that their country consisted of 32 islands, and by the form of their vessels and sails their country seemed to be in the neighbourhood of the Mariana's, or Ladrone Islands; they related that their country was exceeding populous, and that all the islands are under the dominion of one king, who keeps his court in the island of Lamaree: the natives go half naked, and the men paint and stain their bodies, making several sorts of figures upon them, but the women and children are not painted; the complexion and shape of their face is much like those of the tawny Philippines or Malaya's: the men wear only a cloth about their loins which covers their thighs, and another loose about their bodies which they tie before. There is little difference betwixt the drefs of the men and women, but that the cloth which covers the women hangs a little lower on their knees; their language is different both from the people of the Philippines and the Ladrone Islands, and comes nearest to that of the Arabs: the woman that seem most considerable among them, wear necklaces, bracelets, and rings of tortoiseshell. They subsisted themselves all the time they were at sea with the fish they caught, in a kind of wicker basket with a great mouth, ending in a point, which they hauled after them; and their drink was rain water, which they happened to be supplied with: they have no cows, or dogs, in their islands, and they run away at the sight of the one, and the barking of the other; neither have they any horses, deer, cats, or any four footed beasts whatever; or any land fowls but hens, which they breed up, and never eat their eggs: they were surprized at the whiteness of the Europeans, having never seen any people of this complexion, as they were at their manners or customs: it does not appear that they have any religion, nor do they use any set meals, but eat and drink whenever they are hungry or thirsty, and then but sparingly. They salute any one by taking him by the hand or foot, or gently stroaking his face: among their tools they have a saw made of a large shell, sharpened with a stone, having no iron or other metals in their country; and were surprized to see the many tools used in building a ship. Their

arms are lances or darts, headed with human bones and sharpened. They seem to be a people of much life and courage, but of a peaceful disposition; and are well proportioned, but not of a large size. We now proceed with the narrative of our voyage.

On Monday, the 30th of September, after having been at the island of Tinian nine weeks, we found our sick pretty well recovered; and this day the tents were ordered to be struck, and to be brought, with the forge and oven on board the ships. We also laid in two thousand cocoa-nuts, and a quantity of limes, for the use of the seamen, the Commodore having experienced them to be efficacious antidotes against the scurvy. On Tuesday, the 1st of October, we weighed, and sailed from Tinian and the rest of the Ladrone islands. Having finished our business on which we were sent, by the discovery of those islands in the South-Seas, according to our original destination, we bent our thoughts towards returning home, and it was proposed, should we be so fortunate as to find the N. E. monsoon set in, before we should get the length of the Bashé islands, to touch at Batavia, which our Commodore preferred to any port of China for recruiting his ships, he being deterred from touching at the latter, and particularly at Canton, by the base and ungenerous usage which Lord Anson received there, after a voyage of much longer duration, and attended with a series of the most dreadful distresses and misfortunes, that called for pity and assistance. We had very little wind this day and the next, till the evening, when it came to the westward and blew fresh. On the 3rd, in the morning we stood to the northward, and made the island of Anatacan, remarkably high, and the same that was first fallen in with by Lord Anson. On the 10th, we observed in latitude 18 deg. 33 min. north, and in 136 deg. 50 min. east longitude. On Friday, the 18th, several land birds were seen about the ships, which appeared to be very much tired: a very remarkable one was caught; it was about the size of a goose, and all over as white as snow, except the legs and beaks, which were black: the beak was curved, and of so great a length and thickness, that it is not easy to conceive how the muscles of the neck (which was about a foot long, and as small as that of a crane) could support it. We kept it alive about four months upon biscuit and water, but it then died, apparently for want of nourishment, being almost as light as a bladder. It was very different from every species of the toucan that is represented by Edwards; and, in the opinion of our Commodore, has never been described. These birds appeared to have been blown off some island to the northward, that is not laid down in the charts. On Tuesday the 22nd, at six o'clock A. M. the northernmost of the Bashé islands, being Grafton's, bore south, distant six leagues. We proceeded without touching at this place, which was proposed, and steered westward again. By our reckoning, which however the experience of Captain Gore has since disproved, it lies in latitude 21 deg. 8 min. north, and in 118 deg. 14 min. east longitude. The principal of these islands are five in number, but we were induced not to touch at any one of them, on account of the dangerous navigation from thence to the straits of Banca. On the 24th, we were in latitude 16 deg. 59 min. north, and 113 deg. 1 min. east longitude. We therefore kept a good look-out for the Triangles, which lie without the north end of the Prasil, and occasion a most dangerous shoal. On the 30th, we found ourselves in latitude 7 deg. 17 min. north, and in 104 deg. 21 min. east longitude. This day we observed several large bamboos floating about the ship. On Saturday the 2nd of November, we found by observation, our latitude to be 3 deg. 54 min. north, longitude 103 deg. 20 min. east; and on the 3rd, we came in sight of the island of Pulo Timoan, bearing S. W. by W. distant about twelve leagues. On the 5th, we anchored in a bay on the east side of the island, in sixteen fathoms water, and at about the distance of two miles from the shore. On Wednesday the 6th, we landed, in hopes of procuring fresh provisions, but found the inhabitants, who are Malaya's, a surly insolent set of people. On seeing us approach the shore, they came

came down to the beach in great numbers, each man having a long knife in one hand, a spear headed with iron in the other, and a dagger by his side. Notwithstanding these hostile appearances, we landed, but could only purchase about a dozen of fowls, a goat, and a kid; for which we offered them knives, hatchets, bill-hooks, and the like, which they refused with great contempt, and demanded rupees in payment. Having none of these pieces, we were at a loss how to pay for what we had purchased, but recollecting we had some pocket handkerchiefs, they accepted of them, though they took only the best. These people are well made but small in stature, and of a dark copper colour. There was among them an old man, dressed somewhat in the fashion of the Persians, but all the rest were naked, except some pieces of cloth, which were fastened with silver clasps round their waists; and they wore kind of turbans, made up of handkerchiefs, upon their heads. We saw not any of their women, whom they probably took care to keep out of our sight. Their houses are neatly built of slit bamboo, and raised upon pillars about eight feet from the ground. Their boats are of an admirable good construction, and some of them of large dimensions. In these they probably trade to Malacca. This island is mountainous, woody, and produces the cocoa-nut, and cabbage tree, in great abundance; but the natives would not permit us to have any of their fruit. We saw also some rice grounds; but what may be the other productions of this island we cannot say. In the bay is excellent fishing, though the surf runs very high. We hauled our seine with great success, but could easily perceive that by so doing we offended the inhabitants, who considered all the fish about the island as their own property. Two fine rivers run into this bay, and the water is excellent; we filled as many casks with it as loaded the boats twice. Some of the natives brought down to us an animal, which had the body of a hare and the legs of a deer. One of our officers bought it; and we would have kept it alive, had it been in our power to have procured proper sustenance; but this being impossible, it was killed, and we found it excellent food. We staid here only two nights and one day, and all the time, had the most violent thunder, lightning, and rain we had ever known. This island of Pulo Timoin lies off the eastern coast of the peninsula of Malacca, in latitude 3 deg. 12 min. north, longitude 105 deg. 40 min. east. Finding that nothing more was to be procured at this place,

On Thursday the 7th, in the morning we set sail, and after arriving in the latitude of Pulo Condore, we had nothing but tornados, and tempestuous weather. On the 10th, at seven o'clock A. M. the east end of Lingien bore S. W. by W. distant twelve leagues. At noon we anchored with the kedge in twenty fathoms; and at one o'clock P. M. we saw a small island, which bore S. W. half S. distant ten leagues. On Monday the 11th, we weighed, and, having made sail, we descried some small islands, which we supposed to be Domines, bearing W. half N. distant seven leagues. At noon by observation we found our latitude to be 18 min. south. On the 12th, at ten o'clock A. M. we saw a small Chinese junk; and on the 13th, a small island, called Pulo Toté. At four o'clock, P. M. we came to an anchor, and saw a small sloop about four miles distant from us, which hoisted Dutch colours. In the night we had violent rain with hard squalls. On Thursday the 14th, we weighed, and at nine o'clock A. M. made sail. The vessel we had seen the day before still laying at anchor, we sent a boat with an officer to speak with her: the officer was received on board with great civility; but was much surprized at finding, that he could not make himself understood, for the people on board were Malays, without a single white man among them; they made tea for our men immediately, and in every respect behaved with great hospitality. This vessel was of a singular form; her deck was of slit bamboo, and she was steered, not by a rudder, but by two large pieces of timber, one upon each quarter. This day the wind became more moderate and variable from N. N. W. to W. S. W. On the 15th, we set sail, and at two o'clock

P. M. Monopin hill bore S. by E. distant ten leagues, having the appearance of a small island. It bears S. by W. from the seven islands, and is distant from them seven leagues, in the latitude of two deg. south. From the seven islands we steered S. W. by S. and soon after saw the coast of Sumatra, bearing from W. S. W. to W. by N. distant seven leagues. In the evening we anchored; and on the 16th, at four A. M. we continued our course S. by E. till the peak of Monopin Hill bore east, and Batacarang Point, on the Sumatra shore S. W. in order to avoid a shoal called Frederick Hendrick, which lies nearly midway between the Banca and Sumatra shore. We then steered E. S. E. and kept mid-channel, to shun the banks of Palambam River, and that which lies off the westernmost point of Banca. When abreast of Palambam River we regularly shoaled our water, and when we had passed it, we deepened it again. We held on our course E. S. E. between the third and fourth points of Sumatra, which are about ten leagues distant from each other. The high land of Queda Banca appeared over the third point of Sumatra, bearing E. S. E. From the third point to the second, the course is S. E. by S. at the distant of eleven leagues. The high land of Queda Banca, and the second point of Sumatra bear E. N. E. and W. S. W. from each other. The strait is five leagues over, and the mid channel is twenty-four fathoms. At six o'clock in the evening, we anchored; and at five in the morning on the 17th, we weighed, with a moderate gale at west. On Tuesday, the 19th, we met with an English snow, belonging to the East India Company, whose Captain with great generosity, presented our Commodore with a sheep, a dozen of fowls, and a turtle. This was a most acceptable present, for we had now nothing to eat but the ship's provisions, which were become very bad. Our beef and pork stunk intolerably, and our bread was rotten and full of worms. In the afternoon we anchored, and sent a boat to sound for the shoals which lie to the northward of Lasipara, which island bore from us S. E. by S. distant six leagues. On the 20th we worked between the shoals and the coast of Sumatra, and having got through the strait, well known to navigators, on the 27th, we steered between the islands of Edam and Horn, and entered the road of Batavia, where we anchored without the shipping.

On Wednesday the 28th, we moored nearer the town, and saluted the fort with eleven guns, which were returned. We here observed, that, since our leaving England, we had lost a day in our reckoning, by having steered westward a year; so that by the Dutch account this day was the 29th of November. We counted in this road more than one hundred sail great and small; among which was an English ship from Bombay, also the Palmouth man of war, which we found condemned and lying a shore, and all the men cleared for England, except the warrant officers, who were left here till the Lords of the Admiralty should think proper to recall them. A Dutch Commodore belonging to their company is always stationed here, who in the eyes of his countrymen is a person of very great consequence. He thought fit to send his cockswain, a very dirty ragged fellow, who asked the Commodore many impertinent questions, as whence we came, &c. at the same time pulling out a book, pen, and ink, in order to set down the answers; but our gentlemen being impatient to save him any more trouble, desired him immediately to walk over the ship's side, and put off his boat, with which he was graciously pleased to comply. The Commodore went on shore, and visited the Dutch Governor at his country-house, by whom he was received with great politeness, and told, that he might take a house in any part of the city, or be lodged at the hotel. Any inhabitant of Batavia permitting a stranger to sleep, though but for a single night in his house, incurs a penalty of 500 dollars: the hotel being the only licensed lodging-house, the governor appoints the keeper of it, who was at this time a Frenchman. This hotel is the most superb building in the city, having more the air of a palace than an inn. During our stay at this place, we were supplied with good greens, fruits of all kinds, and plenty

plenty of fresh meat: we took also on board a great quantity of water, at the rate of five shillings a leger, or a hundred and fifty gallons. A ship of four hundred and fifty tons, built at Bombay, was employed in caulking the Dolphin, and paying her bottom and sides with varnish. When we arrived here, we had not one man sick in either ships; but knowing Batavia to be more unhealthy than any other part of the East Indies, and as the rainy season was at hand, and our men could procure arrack at a very low rate, it was for these reasons resolved to make our stay as short as possible: however, we had an opportunity of enquiring into the state of this country, and we hope the following particular account of what we learnt will not be disagreeable to our friends and readers.

The island of Java, the capital whereof is Batavia, lies six degrees south of the line, and is divided from Sumatra, distant therefrom five leagues, by the straits of Sunda. It is supposed to be 420 miles in length extending almost due east and west; but its breadth, which is hardly any where more than 150 miles, is different in different places. On the north coast of Java are several good harbours, commodious creeks, and flourishing towns, with many islands near the shore. Though Java is situated so near the equator, few climates are more temperate and healthful at particular seasons, the east and west winds blowing all the year all along the shore, besides the general land and sea-breezes, but in the month of December the coast is very dangerous, on account of the violence of the westerly winds. In February the weather is changeable, with storms of thunder and lightning: and in May the rains are sometimes so violent, for three or four days together, that all the low countries are laid under water: one great convenience attends this disagreeable circumstance, which is that of destroying infinite broods of insects, that would otherwise destroy the fruits of the earth. Their sugar and rice ripen in July and October, which months not only furnish the inhabitants with all kinds of fruits, but with every necessary and luxury of life. The land, which is very fertile about the sea-coast, is finely diversified with hills and valleys, which, near Batavia, is highly improved by rich plantations, spacious canals, and whatever can add to the charms of a country naturally pleasant and agreeable. But the Dutch have made a very inconsiderable progress in the cultivation of the country beyond the neighbourhood of that city, the entrance to the inland parts being almost every where obstructed by impassable forests, or by mountains, whose heads seem to touch the clouds. Java produces a great variety of fruit: there are here cocoa trees in abundance; and in the plains is found a tree, whose fruit is called jamboos, the juice whereof is used by the natives as an infallible remedy against the flux, which often rages with great violence. The Indian sorrel, which has no resemblance to that in England, is eaten by the inhabitants in large quantities with their salads, and its leaves mixed with saw-dust of sandal wood is used as a certain cure for the tooth-ach. Their fruits are, in general, very rich, particularly their pompions, the inside of which are red, and taste not unlike our cherries. With respect to their shape, they bear the nearest resemblance to an orange, but are of a much larger size; a single one sometimes weighing eight or ten pounds. This fruit, if left on the tree, continues in perfection all the year round, and when gathered, will, with care, keep four or five months. We thought them so excellent, that we brought many of them to England. The mango fruit rises from a white flower that grows on the small twigs of a tree, every way as large as our English oaks. Pepper and coffee also grow in the country, and at a small distance from Batavia are several plantations of sugar canes, from which is made a considerable quantity of sugar. What is here called the Indian oak, is as durable as any that can be found in Europe, the wood being of such a consistence, as to be proof against the worms, and, what is more, against the mice, which will gnaw a passage through almost every other sort of wood. The leaves of this tree boiled in water, till one half of them is consumed, is, among the natives,

No. 30.

the general remedy against pleuritis. In short we were told, that almost all sorts of garden stuff thrive in Batavia, and that those brought not only from Surat and Persia, but from Europe, yield near that city a great increase, so that their kitchen gardens produce peas and beans, with roots and herbs sufficient for the consumption of the inhabitants; however rice is the only corn that grows in the island. The woods and forests of Java abound with a prodigious variety of wild beasts, as rhinoceroses, tigers, foxes, buffaloes, apes, wild horses, jackals, and crocodiles. Their cows are nearly as large as ours in England, and have generally two or three calves at a time: their sheep are also nearly of the size of ours. They have likewise a prodigious number of hogs whose flesh is esteemed excellent, and far preferable to beef or mutton. Here are a variety of fowls, particularly partridges, pheasants, wood-pigeons, wild peacocks, and bats so large, that the body of one of them is as big as that of a rat, and their wings when extended reach at least three feet, from the extremity of one to that of the other. With respect to reptiles, they have many that are very pernicious, particularly scorpions, among which we saw several that were at least a quarter of a yard in length; but those of a smaller size are so common, that it is hardly possible to remove a chest, a looking-glass, or a large picture, without finding them, and being in danger of suffering by their sting. The same creature smothered in oil, and applied to the wound is a general remedy against their poison. Besides these, there are a great number of snakes of different sizes, from one foot in length to ten. Among a variety of valuable animals useful to man, there are none more plentiful than fish, of which there are many kinds, and very good, as also a great number of turtle.

The island of Java was formerly divided into several petty kingdoms, which are at present united under the jurisdiction of the king of Bantam; who is in the possession of the eastern part of the island, as the Dutch are of the western, and some parts of the coast. The natives of Java are, according to the Dutch, not only proud beyond measure, but skilled in all the arts of imposture. Their faces are flat and of a brown cast, with small eyes, like the ancient Chinese, from whom they boast their original descent. The men, who are strong and well proportioned, wear round their bodies a piece of calico, which among the more wealthy is flowered with gold. The women are in general small of stature, and have a piece of calico, which reaches from their arm-pits to their knees. The principal part of them, especially those near the coast, are Mahomedans, and the rest Pagans. In the western part of the island are many towns, and in the eastern, the cities of Balambuan and Mataram are those in which the king of Bantam resides, who is styled the Emperor of Java. Batavia was formerly no more than an open village inhabited by Pagans, and surrounded by a palisado of bamboos; but since the Dutch have established a settlement, it is become one of the finest cities in the Indies. It lies in 5 deg. 50 min. south latitude, and is watered by many small rivulets which unite into one stream, before they discharge themselves into the sea. The city is of a triangular form, fortified with a stone wall that has twenty-two bastions, and four great gates, two of which are exceeding magnificent. The harbour is very capacious, being large enough to contain a thousand vessels in perfect security from the violence of the winds. It is shut up every night with a chain, through which no ship can pass without permission, and paying a fixed duty, to enforce which ordinances it is guarded by a strong party of soldiers. The streets run in right lines, and are most of them thirty feet broad, and paved with brick near the houses. Fifteen of the streets have canals of water running through them, and over one of those canals are four strong bridges, each consisting of four arches twelve feet broad; but in the city there are fifty-six bridges, besides many draw-bridges without the walls. The streets are so crowded, that from four in the morning till late at night it is difficult to pass through them, on account of the concourse of people continually

3 R

continually engaged in business. We may observe of the public buildings, that the Chinese hospital is a neat structure, supported by a tax laid on marriages, burials, and public shews, as well as the voluntary contribution of the Chinese-merchants. In the same street is a foundling-hospital, and also a building, in which are lodged all the artisans in the Dutch East-India Company's service. The company have likewise a great rope-yard, that employs a considerable number of the poorer sort of people, who work under the shade of the nut-trees planted on each side. To the west end of this yard are the company's warehouses, for mace, cinnamon, cloves, and other commodities. In the castle, which is of a quadrangular figure, built upon a flat, are apartments for all the members of the council of the Indies. The palace is within the walls of the castle, and is appropriated to the use of the governor. It is built with brick, but is extremely magnificent, and loftier than the other buildings of the city. On the top of the turret belonging to the palace, is placed an iron ship curiously wrought, for the purpose of a weather cock, which is so large that it may be seen some leagues out at sea. Round the city forts are erected, to protect the inhabitants of the plain from the incursions of the original natives, who before they were erected, frequently came down upon the people, and plundered their plantations. Among the principal public buildings are a very handsome town-house; a spinhuys, or house of correction; also four or five churches for the Dutch Calvinists; besides a great number of religious structures for the use of persons of other religions. The garrison consists of foot; and there is a troop of horse, as a guard for the company's possessions lodged in the city: these men are of good stature, and when drawn up in their uniform, make no despicable appearance.

The inhabitants of Batavia are a compound of various nations, among whom the Dutch are the most powerful and wealthy. Next to these are the Chinese, who are, perhaps, the most ingenious cheats in the world. They farm the excise and customs, and indeed are sure to be concerned in every thing from which they have a chance of deriving the least profit. They live under a governor of their own, and dress in the same manner as those in China; but wear their hair long and neatly braided, paying, in this last circumstance, no manner of regard to the Tartarian edicts, which in China oblige the natives to cut off all their hair but one lock. It is remarkable that on the top of a mount of earth, underneath which lie the remains of one of their governors, stands a table, whereon is placed a cup, into which the Chinese sometimes put money and provisions as an offering to the soul of the deceased. This is situated in the midst of a grove, without one of the city gates. The Malays, who are the next in riches and trade to the Chinese, also live under a governor of their own. Their houses are covered with leaves, and surrounded with cocoa-trees. Their dress is the same with the Chinese, and they are generally chewing betel. The Mardykens, or Topasses, are idolaters of various nations, who live both within and without the city, and seem to be a people of easy disposition, who accommodate themselves without much difficulty, to the customs and manners of the people among whom they reside. Their merchants carry on a considerable commerce: others of them are of different trades, and particularly excel in gardening. They dress in much the same manner as the Dutch, and their houses are of stone, well built, and covered with tiles. Besides these, there are people of many other nations, all of whom have their different dresses, customs, manners, and places of religious worship. So that the inhabitants of this city make a more motly appearance than can be conceived by any who have not seen them. The roads about the city, for many miles, are as good as any in England: they are very broad, and by the side of them runs a canal, shaded with trees, which is navigable for vessels of a very large size. On the other side of the canal are gardens, and the country houses of the citizens, (most of whom keep their carriages, it being

almost a disgrace to be seen on foot) where they spend as much of their time as possible, the situation being less unwholesome than the city, which is built on a swamp; and the trees, though they have a pleasant appearance, must undoubtedly prevent the noxious vapours that are perpetually arising, from being dispersed, by obstructing the circulation of the air. Thus we have given a particular account of every thing we saw in Batavia worthy of observation; of which place the reader will find a still more circumstantial, full, and complete description, in the history of Capt. Cook's first voyage, page 82 of this work. We now prepared for our departure; and having fitted the Dolphin, taken in our water, and a sufficient stock of fresh provisions, together with a quantity of rice and arrack,
